This book is dedicated to:

Dr. Joseph T. Acri

Rhonda N. Hildreth

Reba and Cecil Miller

Preface

What better way could there be to commemorate the three-decade collaboration of our editorial team than to bring forth this third edition?

We have been faithful to the original model of presenting a review of the literature by major subfields of public administration. For each subfield, there are two bibliographic treatises written by subject matter experts from one of these different perspectives:

- Starting in 1880, the development of the field's literature, decade by decade
- Author opinion and analysis of the five great theories, concepts, or ideas that describe the field's literature

In addition to updated chapters, we have added two new units, one on information technology and the other on conduct of inquiry.

We editors are grateful to each chapter author, not only for their willingness to share their intellectual contributions, but also for their diligent labors. We hope that this book will be as well received by the profession as were the previous two—in sum, the industry standard as is befitting the first attempt to develop a comprehensive volume dealing with the vast field of public administration.

We all welcome your comments and suggestions.

Jack Rabin
W. Bartley Hildreth
Gerald J. Miller

Editors

Jack Rabin is a professor of public administration and public policy at The Pennsylvania State University—Harrisburg, Middletown, Pennsylvania. Previously, he was an associate professor and chair in the graduate program in human services administration at Rider College in Lawrenceville, New Jersey. He serves as editor/coeditor of seven journals: the *International Journal of Organization Theory and Behavior* and the *International Journal of Public Administration* (both journals, Marcel Dekker, Inc.), *Public Administration Quarterly*, the *Journal of Health and Human Services Administration*, the *Journal of Public Budgeting Accounting, and Financial Management*, the *Journal of Management History*, and *Public Administration and Management: An Interactive Journal*. Dr. Rabin is author, editor, or coeditor of 25 books, including the *Handbook of Public Budgeting*, the *Handbook of Public Personnel Administration*, the *Handbook of Public Sector Labor Relations, Politics and Administration*, *Managing Administration*, *State and Local Government Administration*, the *Handbook of Information Resource Management*, the *Handbook on Human Services Administration*, the *Handbook of Strategic Management*, and *Public Budgeting and Finance* (all book titles, Marcel Dekker, Inc.). Dr. Rabin, moreover, was a consultant in budgeting and strategic planning in the executive office of the President of the United States. He also serves as executive editor of the Public Administration and Public Policy Series (Marcel Dekker, Inc.). Dr. Rabin received a Ph.D. (1972) in political science from the University of Georgia, Athens.

W. Bartley Hildreth is regents distinguished professor of public finance at the Hugo Wall School of Urban and Public Affairs and the W. Frank Barton School of Business, and director of the Kansas Public Finance Center, Wichita State University, Kansas. Dr. Hildreth has served as director of finance for the city of Akron, Ohio; associate professor of finance and public administration in the graduate school of management at Kent State University, Ohio; professor of public administration in the College of Business Administration at Louisiana State University, Baton Rouge; and former chair of the Association for Budgeting and Financial Management, a section of the American Society for Public Administration. Currently, he serves as editor-in-chief of the *Municipal Finance Journal*, book review editor of the *International Journal of Public Administration* (Marcel Dekker, Inc.), member of the National Advisory Council on State and Local Budgeting as well as the Council on Certification for the Certified Public Finance Officer program of the Government Finance Officers' Association, and board member of PFP Publishers. His work has been published in numerous journals, such as the *Public Administration Review*, the *American Review of Public Administration*, the *Public Administration Quarterly*, *Public Budgeting & Finance*, *Public Budgeting and Financial Management*, the *Journal of Applied Behavioral Science*, the *Review of Public Personnel Administration*, *Public Personnel Management*, and *Public Productivity Review*. His publications also include *State and Local Government Debt Issuance and Management Service*. In addition, he is the coauthor of the *State and Local Government Budgeting Practices Handbook* and *Public Budgeting Laboratory, Second Edition* as well as coeditor of the *Handbook of Public Personnel Administration*, the *Handbook of Public Sector Labor Relations*, the *Handbook of Strategic Management* (edited titles, Marcel Dekker, Inc.), *Case Studies in Public Budgeting and Financial Management*, and *Budgeting: Formulation and Execution*. In 1995, Dr. Hildreth received the Donato J. Pugliese Award from the Southeastern Conference for Public Administration for his contributions to public service and administration. A former member of the Governor's Tax Equity Task Force and director of research for the 1995 Kansas tax reform study,

Dr. Hildreth received a B.A. (1971) in political science from the University of Alabama, an M.P.A. (1974) from Auburn University at Montgomery, Alabama, and a D.P.A. (1979) from the University of Georgia, Athens.

Gerald J. Miller is a professor of public administration, Rutgers, the State University of New Jersey in Newark. The author of over fifty research articles, his work has been published in numerous journals in the United States and abroad, including *Public Administration Review*, *Policy Studies Journal*, *Public Budgeting & Finance*, *Journal of Public Budgeting, Accounting & Financial Management*, *Public Productivity and Management Review*, *International Journal of Public Administration*, *Public Integrity*, and *Public Administration Quarterly*. Having published over twenty books, he is the author of *Government Financial Management Theory* and coauthor of the *Public Budgeting Laboratory*. He is the editor of the *Handbook of Debt Management* and coeditor of the *Handbook of Public Policy Analysis* (with Frank Fischer and Mara Sidney), *Handbook of Research Methods in Public Administration* (2d ed. forthcoming with Kaifeng Yang), *Handbook of Strategic Management* (with Jack Rabin and W. Bartley Hildreth), the *Handbook of Public Personnel Administration and Labor Relations*, and the *Handbook of Public Sector Labor Relations* (both with Jack Rabin, Thomas Vocino and W. Bartley Hildreth). In addition, he has published *Managerial Behavior and Organization Demands* (edited with Robert T. Golembiewski and Frank K. Gibson), *Budget Management*, and *Budgeting: Formulation and Execution* (both edited with Jack Rabin and W. Bartley Hildreth). He is an editorial board member of the *International Journal of Public Administration*, *Journal of Accounting*, *Public Budgeting & Financial Management*, *Municipal Finance Journal*, *Public Productivity and Management Review*, *Journal of Public Management*, and *Journal of Health and Human Resources Administration*. He serves as a book review editor for the *Public Administration Quarterly*. As a former investment banker with the firm of Rauscher, Pierce, Refsnes, Inc. in Phoenix, Arizona, Dr. Miller continues an active consulting practice in the United States, Canada and Western Europe with clients including national, state, and local government organizations in legislative, executive and judicial branches of government, as well as private businesses and business and public sector associations such as the Chartered Institute of Public Finance and Accountancy (England and Wales), the Government Finance Officers Association of the U.S. and Canada, the World Bank, and the International City and County Management Association. His research centers on resource allocation in nonmarket organizations; his work has received continuous and substantial support from government and private donors in the United States, Canada, England and Wales, and the European Union. Dr. Miller received a B.S. in economics and an M.P.A. from Auburn University. He received a Ph.D. in political science from the University of Georgia.

I. INTRODUCTION

In light of the numerous significant political and economic issues, one would expect public administration also to experience a variety of issues. It is, after all, in if not of politics. The study and practice of public administration are indeed under scrutiny. Concerns range from the nature of its managerial premises to its ability to carry out the affairs of state for which it was created. A continuing populism (Rosenbloom 1993a) fed by Americans' distrust of government

as well as advances in information technology provide for instant popular opinion and government by initiative. The Internet along with cable television provides a venue for all types of groups to advocate for their own interests and ideologies. Starting with the presidency of Richard Nixon, political executives see less and less value in a high level civil service. Consequently, the recently created Department of Homeland Security does not provide civil service to its employees. National level politics continue to become increasingly partisan, sometimes exacerbated by adherence to strongly expressed, if not strident, ideologies. At the municipal level, elected officials increasingly question the executive authority of city managers, apparently elevating election as empowerment rather than a method of selecting an officeholder. These developments question the degree to which independent and professionally trained administrators can provide responsive and responsible government. They also raise important questions about some fundamental premises upon which the study and evolution of public administration has been based. Within the field, many scholars, following in the footsteps of Dwight Waldo (1948), continue to question the foundations of both the study and the practice, critically examining its so-called scientific roots and an often implicit political philosophy (Farmer 1998; Fox and Miller 1995; Spicer 1995).

This chapter is organized, as were previous editions of the chapter, to review, decade by decade, the history and organization of the study and practice of public administration. This history illustrates the peculiar mix of events and people that influenced the direction of a practice, if not a profession, and a field of study.* Major highlights are preserved, although some illustrative materials have been deleted and others arranged differently. Events and people in public administration are linked to contemporary events and trends. Thus, the chapter starts with major political issues, as the field and profession are part of the larger society. All is organized by ascertaining the influence of three models of governance on the field. These are explicated in the following section.

The importance of public administration derives from its crucial role in the governing of a society (Rohr 1986). Governance is best illuminated by examining politico-administrative systems. Accordingly, viable images or models are important tools to guide research and reflect practice (Boulding 1956; Kass and Catron 1990; Morgan 1986). For example, Bailey (1968) and Henry (1975) suggest that the scope of public administration concerns normative questions about the “oughts” of administration, an openness to technology and management, and regard for the impacts of individuals and organizations on public sector policy and management. In addition, the “refounding” movement has refocused attention to the role of public administration in governance. Others call attention to the role of Law and the Constitution in the practice (Cook 1996; Cooper 1992; Rohr 1986; Rosenbloom, Carroll and Carroll 2000; Wamsley and Wolf 1996). In international affairs, a scholar has pungently questioned how global economic development has been pursued. He argues forcefully that many lessons of Public Administration have been ignored (Fukuyama 2004). Emphatically, he noted that current efforts in global economic development were based on a “black hole of public administration.” These ignored seventy years of literature in Public Administration.

Historically, as politico-administrative systems, three rather distinct American models can be identified, with each having widely different roles for public administration. Each connects with the normative sides of different disciplines. Thus, to understand the history requires a brief examination of the rise and content of the three models.

* Michael Foucault, in another context, described the utility of such an approach in the following way: [T]o follow the complex course of descent is to maintain passing events in their proper dispersion; it is to identify the accidents, the minute deviations—or conversely, the complete reversals—the errors, the false appraisals, and the faulty calculations that gave birth to those things that continue to exist and have value for us; it is to discover that truth or being do not lie at the root of what we know and what we are but the exteriority of accidents (Foucault 1976, 146).

II. ADMINISTRATION, POLITICS, AND HISTORY: THREE LEGACIES OF REPUBLICAN GOVERNANCE

Three models of politico-administrative systems have driven the evolution of public administration.* Philosophically, the models can be traced to the founding of the republic, greatly modified over time. These models illustrate variations in how governments control conflicting interests and govern a society. They include both descriptive analyses and normative assessments. The scope and nature of public administration is defined in light of the assumptions behind these models.

Many of the founding fathers perceived people as inherently corruptible, analogous to what Christian theology denotes as being in a state of original sin. This assumption is significant because for the founding fathers it suggested that public power must be allocated in ways that avoid tempting people with opportunities for personal corruption. From this perspective, the founding fathers' concern with checks and balances is understandable; it is a structural hedge against the foibles of innately fallible humankind.

A second assumption dealt with the control of official authority in a republic. The purpose was to create a limited government, with no official able to exercise public authority without approval from representatives of the people and/or the specification of the authority in a constitutional provision. Government consisted of a variety of public offices sharing public authority. The offices were filled by very different methods. By dispersing authority through a fragmented governmental structure (checks and balances as well as federalism), the design limited opportunities for tyranny. Tyranny, as James Madison's research prior to the Constitutional Convention noted, was often an outcome of badly designed offices, particularly the office of the main executive.

A third assumption anticipated the participation and conflict of individuals and groups around public bodies. Madison's *Federalist* No. 10 reflected a belief in the inevitable evil of factions and the need to control them. Madison assumed that factions seek favorable governmental action with control best achieved by balancing the factions against each other. Although some faction might pursue a more elitist and general public interest (Redford 1969), this would not rectify the tendency of the rest to follow their special interests. Thus our first model, the *conflict of factions* (COF) model, assumes that a jostling of interests would be an enduring, yet deplorable, characteristic of a polity. In the Constitutional Convention, public offices were designed to respond to and dominate differing mixes of interests, thus assuring that no one interest or related interests alone could determine policy.

On the other hand, Hamilton, among others (Caldwell 1944, 1987), urged that some public offices be rooted in the Constitution and empower the incumbent to exercise considerable discretion. These offices could provide energy and direction that might counter current desires of even those interests that had been instrumental in their selection. Other founding fathers coupled this capability to an ethical demand, calling for holders of public office to seek fame; that is, to act in a way that would be judged by future generations as working for a better society generally (Hart 1984). Fame-seeking individuals would moderate conflicts among factions and promote a disinterested sharing of authority. Nevertheless, most of the founders, and with exceptions such as many of the reformers who founded modern public administration, succeeding generations preferred separation of powers so as to dilute the effects of factions and thus protect the system.

* Several others have commented on three models or variables. The model in this chapter differs by looking at broad political patterns over all of American history. In essence, the models are three distinct philosophies on governance with direct implications for public administration. In contrast, Stillman (1982) examined the conceptions of three of the founding fathers and ascertained three different models of government. In his classic piece, Kaufman (1956) identified three core values around which the field of public administration has oscillated.

Soon afterward, elements for a second model, the *rule of factions* (ROF) model began to draw attention. Within this model public authority and legitimacy were grounded on direct election. Parties, which arose relatively rapidly but which did not become important until decades later, emphasized the representative function and made the “fame-worthiness” call more difficult to implement (Hofstadter 1969). Using its integrative tendencies, the political party became a vehicle for governance by uniting various factions. Party and policy loyalty among officeholders became critical. Offices were often allocated to secure votes or other resources for elected officials. However, the basic political structures created under the COF model were not dramatically changed. Particularly at the municipal level, the outcome seemed to personify Aristotle’s classification of a democracy as the degenerative form of a republic. This same perspective compelled many founding fathers to condemn Andrew Jackson, including Thomas Jefferson whose name later often became coupled with Jackson’s (Wills 2003).

The ROF model focused on election as the foundation of public authority. The electorate and the number of elected offices were expanded. Governmental behavior was to reflect electoral results. Normatively, with a successful election went the right, if not the responsibility to implement a proposed program, platform, or mandate. Officeholders were selected according to either their agreement to the policy preferences of elected officials, or the utility of their appointment in securing votes or other political resources necessary to implement a program. In reality, such dynamics frequently enriched individuals or supported parties with little regard for the impact of public programs. Ironically, as Crenson (1975) noted, the need to supervise these political appointees, who had little, if any, specialized knowledge or commitment to any notion of a public interest, created the impetus toward an expanded government bureaucracy.

Late in the nineteenth century, contending with a rapidly urbanizing and industrializing country energized by an accelerating technological revolution, a movement of reformers called for basic changes in American government. Although reformers battled over specific elements (Holli 1969), most shared basic assumptions and their beliefs directly influenced the development of American public administration (Crunten 1984; Haber 1964; Keller 1989).

In the third model, the *public interest* (PI) model, the efficacy of science formed the cornerstone of governance. The application of science, the reformers believed, would solve current public problems and inculcate morality.* The need was to create governmental structures that empower experts: people who possessed relevant scientific knowledge. Educational credentials indicated expertise. In many ways, this began the American concern, if not obsession, with academic degrees.

The reformers conceptualized science as a cumulative and growing body of knowledge. This concept of science that many Americans still possess is more correctly termed technology (Merton 1970). Many reformers expressed faith in the acquisition of total knowledge through the careful and consistent application of the scientific method. They perceived few limits to the efficacy of science and its ability to solve all current problems by the application of unbiased general laws.† Philosophically, this belief derived from the Enlightenment movement. Scientific

* The spoils system had some ironic outcomes. Surprisingly the use of unfit and unmotivated people for public service required considerable supervision. This extensive supervision helped to bureaucratize public service (Crenson 1975). As a result, a citizen may have difficulty distinguishing a complex public agency created to implement expertise from one that is staffed by patronage. Both seem baffling, emphasizing procedures and certainly not appearing transparent to citizens. All too often desired action only occurs after the discovery of the right person. Interestingly, the belief in a science-based management has waned but such a belief drives much of the public policy perspective. In fact, candidates for public office seek out policy works to forge a platform based on effective policies.

† The novel *Philip Dru, Administrator*, published in 1912, captures this belief and its expression in administration. Philip Dru is the appointed Administrator of the United States in the wake of the Second Civil War. He solves all problems, even seemingly intractable social problems. He sails for the Soviet Union to become their administrator, bringing universal science to solve public problems regardless of political or cultural context. The book was published anonymously, but was later attributed to Colonel House, chief advisor to Woodrow Wilson (Haber 1964).

rationality was seen as not only desirable but also feasible in an era of urban-centered technology. A crucial element of the new politico-administrative system was management because science enables administrators to be rational. Appropriately trained experts, administrators, empowered by appointment to public office by representatives of the people, would exercise all administrative authority and be answerable only to the appointing body that would follow their expert advice. These revisions, among others, found a home in the council-manager form of government, the only significant new structure in the American politico-administrative system since the writing of the Constitution. At the national level, the reformers such as Brownlow advocated placing the experts in the executive branch, where they would report to the president (President's Committee on Administrative Management 1937).

By separating politics from administration, reformers believed that scientific rationality would eliminate political conflict. Any conflict over issues that could be resolved by research obviously would be dysfunctional, or as some of the reformers stated, inefficient. The nonpolitical application of knowledge would gain public interest, a state of affairs in which all would be better (Brownell and Stickle 1973; Haber 1964; Hofstadter 1955; see Spicer 1995, for an insightful comparison of the founders and reformers beliefs). Interestingly, this distinction between politics and governing is similar to how a recent biography on Napoleon summarized his views on politics. According to Englund (2004), Napoleon hated politics—particularly, as a review put it, “the freewheeling clash of interests found in America and Britain”—but loved the political, the governing of the state and community. Napoleon also reflected rational systems, implementing a code of law and the metric system.

This PI model assumed perfectibility of people through knowledge.* Rationality not only increases the ability to shape reality, but perfects individuals morally. To increase rationality the reformers were willing to grant extensive public authority to experts. Formal education was broadly mandated at least through high school. Education not only sharpened cognitive skills, but it infused a scientifically based morality. In retrospect, this approach to education sadly overlooked Horace Mann's (Antioch College 1937) concern for training citizens for a democratic republic.

The ROF and PI models came to the fore after the Civil War. The ROF model was to serve as the pattern for presidential reform, while the PI model initially influenced civil service reform and local government. Placing civil servants under the president at the national level can be seen as a compromise between the two. Although no one model was able to assert sole influence, at different times one would be more significant than the other. The PI model has guided public management for most of the twentieth century. Social and political events during the 1980s and 1990s, however, suggest a resurgence in the support for the ROF model, with considerable skepticism regarding the future of the PI model for providing for the public's needs without significant attention to demands for change.

*Plato was one of the first to express a relationship between knowledge and virtue. The concept of philosopher kings certainly reflects a belief in this relationship. During the American reform era, the moral nature of the politico-administrative system, and life in general, was inculcated in the capstone courses of colleges. In his study of the Mugwumps, James McLachlan found that they were predominantly college educated. The capstone course at the time was moral philosophy, taught by the university president who typically connected the moral imperatives of philosophy to the problems of the time. In contrast, the industrial elite and New York City officials, the groups to which he compared the Mugwumps, typically had no college education (McLachlan 1974). Karl Marx's methodology and his utopian beliefs are also reflective of the moral nature of knowledge. Thus, after the inevitable revolution, he predicted the withering away of the state as conflict would disappear (Feuer 1969). A similar outlook fueled Thomas Jefferson's concern over public education. For him, education of independent yeoman minimized the need for government as well as called into question the necessity of the state. The yeoman would be both informed and moral, thanks to education. The view ironically compelled Jefferson, particularly when holding an executive office, often to act differently from his stated philosophy. The original administrative structure for the University of Virginia is a clear example of what Jefferson expected education to achieve morally and politically. The University had no president until the early years of the twentieth century (Ellis 1996).

III. THE 1880s: INTIMATIONS AND FOUNDATIONS

During the 1880s, the United States became an urban industrial society with laborers replacing farmers as the modal occupational category by 1900 (Naisbitt 1982; Toffler 1980). Unfortunately the political system was not ready to handle the increased demand for the necessary traditional public works, much less the social needs of an urban nation. Many cities became domains of political machines, where partisanship and corruption controlled most aspects of public policy (Bridges 1984). A concern for a public interest was scarcely evident in those locales of the ROF model. However, it should be noted that public had a much narrower definition at that time, with most of what is now identified as public services provided by private, for-profit firms (Callow 1976; Riordon 1948; in contrast, see Dewey 1927).

The 1880s were the seedtime of contemporary public administration (Peterson 1961; White 1957). City growth and governance was the focus of political action (Howe 1925). The decade was marked by an explosion of immigration from overseas and from the rural countryside to the cities. Large industrial firms and their international markets played a catalytic role (Chandler 1984; Degler 1959; Hofstadter 1963), often in combination with corrupt political machines. The often naked use of political power by private interests helped spawn reform efforts, one branch of which created the field of public administration (Croly 1909).

The first theoretical piece on public administration is attributed to Woodrow Wilson, written while he was a young and reform-minded professor (Stillman 1973; Wilson 1887; for a dissenting but discerning view, see Hoffman 1998, 2002). Though Wilson's essay is traditionally cited as the intellectual cornerstone of public administration, it later influenced theory rather than contemporary practice. As Van Riper (1984) observed, citing Waldo, the earliest contribution to public administration as a "scientific practice" may be the work of Dorman Eaton, a New York lawyer who produced a civil service study for President Hayes. Eaton later became a major figure in the municipal reform movement (Van Riper 1983). In this decade, Johns Hopkins, one of the first modern research universities, established a program in what would later be called public administration. Interestingly, its curriculum was a broad social approach that was lost to a later, narrower management focus (Hoffman 2002).

Wilson (1984) did, however, identify how assumptions and substantive concerns drive the practice of administration. He visualized a government independent of the culture and time. He called for a businesslike approach to government with an administrative technology that could overcome the partisan nature of American politics.* The modern civil service, created in 1883 (prior to Wilson's published essay), was an early reform illustrative of the PI model. Though it initially applied to only 12% of the federal workforce, the reformers were sufficiently shrewd enough to provide for its expansion by permitting presidents to protect their appointees by converting the positions to civil service. By 1900, over 100,000 federal employees were covered (Hoogenboom 1961; Van Riper 1958).

The development of government regulatory agencies, such as the Interstate Commerce Commission (ICC) in 1887, exemplified the reformers' belief in the efficacy of the specially educated to lead an industrial democracy. Though initially given limited power, and for a long time hindered by an unsympathetic Supreme Court, the ICC eventually became the prototype for other government regulatory initiatives. For those who saw separation of powers and factionalized politics as a handicap in dealing with the social and economic problems of a complex society, regulatory agencies manned by experts and divorced from the traditional political bodies were the answer (Landis 1938; Rosenbloom 1983). These agencies deliberately violated separation of powers and mobilized the expertise necessary to end corruption, implement policies in the public interest, and monitor the results to ensure proper outcomes. The reassertion of interest

* This was originally published in 1912 in the *Woman's Home Companion*, indicating the persistence and diffusion of reform efforts. See Bok (1920) for the story of the leading women's publications during the reform era.

group politics during the 1980s and 1990s would question many of these assumptions and lead to major efforts to reduce the regulatory roles of the national government.

The reform effort was active on a broad front starting from this period. Social organizations had long been a facet of American life, as observers from as early as DeTocqueville had noted. The groups that emerged after the Civil War, however, often pursued policies that went beyond the needs of their own members. The American Economic Association, for example, created in 1885, espoused the goal of positive aid from the state to help meet broader societal needs. Among its founding members were Andrew Carnegie, Woodrow Wilson, and Henry Adams, who shared an interest in expanding public responsibility (Commager 1950). At the local level, social movements such as settlement houses were fertile grounds for what was later considered local public administration. As Cam Stivers pointedly noted, these tended to be lost in official histories that emphasized management rather than social policies (Stivers 2000). Thus, municipal bureaus of research were perceived as the legitimate ancestors of modern managers. These typified the PI model with its emphasis on science and downplayed several community-oriented philosophies that were significant seedbeds for public administration* (Hoffman 1998; Stivers 2000).

IV. THE 1890s: PRELUDE CONTINUED

Although fewer innovations in public administration occurred in the 1890s, this decade was critical to the general development of American thought and culture. The role of Congress in urging administrative reform grew and the contest between the ROF model and the emerging PI model continued. The 1890 Sherman Anti-Trust Act and earlier interstate commerce legislation emphasized reform policies; nonetheless, these actions were often frustrated by the rulings of a conservative Supreme Court.

During this period there was a slow but steady evolution of the administrative apparatus, often designed to cope with immediate political issues. Reformers were strategic in attaching administrative reforms to as many issues as they could. For example, because of scandals over the quality of pork shipped to Europe and the 50% decline of domestic sales, the inspection of pork by the national government started in 1890. The industry clamored for government inspection as a way to rebuild consumer confidence (Schlesinger 1983). The period also saw major improvements in urban governance. Reform management practices were applied to problem areas such as public health, housing, and water and sewage treatment systems (Bettmans 1974). Frank Goodnow's *Comparative Administrative Law* (1893), the first American treatise on public administration, was written during this decade. It was a forerunner for those noting the growing significance of administration to modern government and society (Haines and Dimock 1935 cited in Van Riper 1984).

In the mid-1890s, the country entered a major depression. With few exceptions, the public sector was not mobilized to combat the economic downturn as in the later depression of the 1930s. In fact, governments at both the state and national levels were more often used to quell labor disputes than to meet social needs. These failures spurred efforts aimed at reform and professional development. By 1894, more than 80 citizens' associations and groups in various cities were attacking abuses. The American Society for Municipal Development was established. The first national conference for good city government was also held, a forerunner to the National Municipal League (NML) (Stewart 1950; Stone and Stone 1975). The thrust toward municipal reform was spearheaded by urban business interests who desired a more businesslike and politically restrained approach to governance (Hays 1964; Weinstein 1962). However, the movement, and the NML, also included reformers such as Frederick Law Olmsted and Theodore Roosevelt (Morris 1979;

* Stivers critiques the rise and emphasis on management as part of consciously diminishing women if not writing them out of history and disciplines. She insightfully delineates the masculine metaphors that permeate political philosophy and which cast public administration as a male domain. This distorts the history of the field and thus unfortunately reinforces its overly rational, nearly anti-political perspective (Stivers 2000).

Stevenson 1977). In some cities, such as those in the South-west, the council-manager plan was adopted as a strategy for capital investment (Bridges 1992, 1997) These initiatives were indicative of later efforts to operationalize a functional separation between governmental management and the political process (Svara 1990).

V. THE 1900s: TRANSFORMATIONS IN PRACTICE

In 1900, a hurricane struck the city of Galveston, Texas, claiming 6000 lives. Reconstruction was facilitated by a new form of city government called the commission form. Reflecting a more practical focus for public management, policy matters were decided by a seven-member commission initially appointed by the state. Each commissioner was also the director of an executive department or departments. A later form of the commission plan that provided for elected commissioners spread rapidly and within a decade hundreds of cities had adopted some version of it (Rice 1977; Schiesl 1977).

Soon afterward, Richard Child's commission-manager form of government was developed (Stillman 1974). This significant amendment of the commission form retained a small legislative body armed with all of the policy-making powers of government. The separation of powers was effectively eliminated at the local level and a politics-administration dichotomy was implemented by vesting a city manager appointed by the commission with all of the administrative power.* The only nonelected chief executive in American political history (the president is indirectly elected via the electoral college) was to be filled on the basis of demonstrated competence that would increase the scope of administration and dramatically reduce that of politics (Childs 1952; East 1965) all in the name of community-wide interest. The form became operational in 1908, although the first city to actually utilize the form is disputed (one claims priority by evolution of the office of city engineer and the other by establishing the system; Stone et al. 1940).

The early city managers were almost solely engineers by profession, in large part a response to the extensive public works needs of expanding cities. The city manager system also implemented other components of the PI model, such as the efficacy of science and the supplanting of partisan politics with at-large and nonpartisan elections. Combined with the public planning profession, the vision was of cities expertly run, morally uplifting to the citizens, and more responsive to the needs of the community (Boyer 1983; Crunden 1982; White 1927; White 1937). In fact, some new cities were designed to be symbols of progress and centers of morality (Buder 1967; Mumford 1961; Scott 1971). These practical concerns of the municipal reformers were perhaps more instrumental in the call for a politics-administration dichotomy than was Wilson's essay (Van Riper 1984).

Later, critics would suggest that professional government was a variant on the machine model, citing the granting of contracts on a sole source basis to "friends" (see Lowi's introduction in Gosnell 1968). For these critics, the values derived from business interests reflected an emerging factional interest, in spite of the beliefs and rhetoric of the reformers suggesting a community interest. Arthur Bentley's focus on interest groups expressed a somewhat different interpretation. In what would later be identified as pluralism, Bentley (1908) captured the dynamics of group participation in public affairs that was to continue and even accelerate in an increasingly organizationally based polity. It was not until David Truman's (1951) classic, *The Governmental Process*, however, that this version of the COF model became a normative base for government studies in American political science. To be sure, Truman took a much more positive view of the results of competing factions than did Madison, who viewed it as an evil influence to be minimized.

* Richard Childs with his typical bluntness characterized separation of powers and checks and balances as "ancient superstitions" (East 1965). He also opposed less than pure forms of the city management system and even debated managers on this point. Banfield, in *Urban Government* (1969), cites additional arguments articulated by reformers against separation of powers.

By 1903, the steady growth of interest in governmental studies that began with the founding of the initial chair in political economy at the University of North Carolina, Chapel Hill, in the decade of the Civil War resulted in the organization of the American Political Science Association (APSA). With the exception of individuals such as Wilson and Willoughby, however, most of the developing discipline focused on abstract issues of political theory and philosophy rather than practical applications (Stone and Stone 1975).

This decade saw bureaus of governmental research become centers of applied research, dedicated to science as a tool in political reform at the local level. The bureaus were important training grounds for many of the reformers, such as Robert Moses (Caro 1974; Upson 1947). For example, the tracking of local finances not only aided in identifying miscreants and speculators, but also created the basis for budgetary and accounting reforms. Moreover, the training and educational programs found in the bureaus later developed into programs of graduate study in public administration, one example being the transfer of some of the training and educational programs of the New York Bureau to Syracuse University. Within a few months a similar program was initiated at the University of Southern California (Goodsell 1986).

VI. THE 1910s: REFORM CONTINUED AND INTENSIFIED

The pace of political and administrative reform began to quicken during the next decade. In 1913, the city managers formed their own professional association, the International City Managers Association. At its annual meetings, managers not only shared mundane experiences, but debated their roles in urban governance.* City planners formed the American Institute of Planners in 1917 (Scott 1971), while at the state level, leagues of municipalities grew in number and eventually organized the National League of Cities (Stone and Stone 1975).

Frederick Taylor's (1923) authoritative writings on scientific management published in 1911 and originally aimed at the private sector gave rise to a technology-based management in the public sector. Scientific management formed the basis of the recommendations of the President's Commission on Economy and Efficiency (1912), better known as the Taft Commission. Both were full of normative fervor and generalizations and illustrated the hopes of the reformers to implement scientific management in a public setting (Caiden 1969).

The same impetus led to the creation, in 1911, of the *Municipal Research Journal* by the New York Bureau's Training School. The concern for research was matched by a concern for training and education for public service. Shortly thereafter the APSA established a Committee on Practical Training for Public Service, leading in 1914 to their issuance of an all but forgotten report calling for separate schools in public administration within universities (Caldwell 1965). The most consistent speaker for specialized professional education in separate university units was Charles A. Beard. He urged professional education much along the lines of many contemporary MPA programs (Caldwell 1965). The curriculum he initiated while director at the Training School was remarkably similar to those endorsed by later National Association of Schools of Public Affairs and Administration (NASPAA) standards (Goodsell 1986).

By 1917, the NML, largely comprised of municipal administrators, published a model city charter to guide the legal reform of city government. The commission-manager form of government was advocated with a unification of powers within the commission and with no provision for an office of mayor. (However, many cities allowed for the position, often conferred on the member of the council with the highest number of votes in the last election.) To ensure adequate representation of varying interests in the community and justify the commission's broad powers, it recommended proportional representation, a method for election of commission members based on only a specific

* Transcripts of the early meetings were printed for many years in the yearbooks published by ICMA. These are interesting glimpses into the experiences and thinking of appointed chief executives on their roles and responsibilities.

number (proportion) of votes.* This recommendation, however, was short lived as it detracted from the community-wide preferences of the business groups supporting reform (Hays 1964).

Reform efforts at the national level were exemplified by the passage of the Federal-Aid Highway Act of 1916. Demanding fiscal responsibility and compliance with scientifically established standards, this categorical grant program carved out an active administrative role for the national government based on the PI model (Uveges 1963). In addition, the Federal Highway Research Board was created and was an early example of the national government's interest in supporting research and its practical application to public problems.

These basic innovations in government, especially at the local level, catalyzed academic degree and public service-type programs in the next decade. The many studies completed and implemented during this period demonstrated the value of professional training and informed analysis to the amelioration of public problems. The resulting administrative needs of expanding government required executive leadership and specialized training, thereby creating a fertile field for the reform and growth in university-based programs.

VII. THE 1920s: MATURATION OF THE PUBLIC INTEREST MODEL

The rapid and geographically dispersed adoption of these administrative innovations justified belief in the public interest model. The early textbooks captured this spirit, as did the first academic portrait of the city manager (White 1927; Willoughby 1927; Storing 1965). Though not as narrowly conceived or as dogmatic as later scholars often stated, they continued to develop and support the public interest model. Reformers encouraged the development of university programs to educate public administration professionals. The University of Michigan started its program in 1914. Later the University of California at Berkeley, Stanford, Syracuse, Cincinnati, Southern California, and the University of Chicago also initiated relevant programs. Local members of the Women's Civic Action League were instrumental in the creation of an Institute of Government at the University of Southern California in 1926. Eventually, in 1929, the university's School of Public Administration was an outgrowth of the reformer's activities.

Though of good intent, many of the developing university programs were comprised largely of a few training courses added to liberal arts curricula. While keeping the reform motif alive, they contributed little to the practical education of managers (Stone and Stone 1975). The failure to establish more focused programs and a research community around public administration may account for the inability to incorporate the findings of research into basic management practices. For example, Mary Parker Follet (1918) created useful management technologies in this regard by the mid-1920s, but they were not a valued component in public management education until many years later (Fox 1968; Metcalf and Urwick 1940).

Some universities also established what would later be called public service units. Efforts such as those by the University of Chicago's "1313" Public Administration Center (Brownlow 1958; Stone and Stone 1975) often reflected the dedication of specific scholars such as Charles Merriam. Unfortunately, the university connection often failed to survive the key actors in academe. Nevertheless, the grouping of such organizations had a high payoff for creating and maintaining networks within the profession. The locus of such activities would eventually move to Washington, DC by the 1960s, thus reflecting the rise of federal programs in all levels of government and the concomitant need for networking in Washington.

At the national level, two staff reforms were initiated that had long-term impacts. The Budgeting and Accounting Act of 1921 implemented many of the reforms called for by the Taft Commission.

* The city of Cincinnati continued to elect their councils at large by a complicated version of proportional representation until the late 1950s. It was only stopped with the election of a black vice-mayor in 1957, an innovation not desired in a city that had recently caused its baseball team to change its moniker from Reds to Redlegs to avoid the taint of Communism. See Miller (1980) and Straetz (1958) for interesting details of this period.

The Bureau of the Budget and the General Accounting Office were both created, though the former was a part of the Department of the Treasury until the creation of the Executive Office of the President in 1939. These two organizations personified the PI model with its emphasis on scientific management through staff units manned by experts. The Bureau of the Budget, later the Office of Management and Budget, was an early example of the administrative infrastructure that would later support what some termed the “imperial presidency” (Reedy 1970; Schlesinger 1973).

If the 1920s was the zenith of both the practice and theory based on the PI model, then the 1930s provided a severe test of these theories and practices. The national government expanded both the variety and level of services offered. The application of scientific management to large-scale government organizations with broad social mandates quickly illuminated theoretical and practical shortcomings. One apparent shortcoming was an inability to handle the political context of public management. Another weakness was the lack of sensitivity to research findings from human relations research. Incorporation would await further experience with and discussion about management of the modern state. Even then, the models of politico-administrative systems did not easily facilitate the melding of politics, administration, and management.

VIII. THE 1930s: THE RISE OF THE ADMINISTRATIVE STATE

By the 1930s, the identification of public administration in terms of scientific management principles was well established. The work of the Social Science Research Council, the Public Administration Clearing House, and the Advisory Committee on Public Administration formed the core of public administration. With funding support from several Rockefeller philanthropies, who insisted their support be seen as nonpolitical, this core group of administrators blended governmental research and scientific management with a distinctly technical and local governmental orientation. This, according to Roberts (1994), provided great reinforcement for the politics–administration dichotomy during the rise of academic public administration programs.

Although identified by pragmatic governmental concerns, the advocates for training for public service were mostly academics. They were committed to the progressive vision of an administrative government capable of resolving societal problems (Mosher 1937). As the depression deepened, people like Luther Gulick, Frederick Cleaveland, William Mosher, and William Willoughby readjusted their focus from the municipal to the national level, applying scientific management principles to the growing public role undertaken by the Roosevelt administration. Leonard D. White had earlier called for a unity for public administration, based on scientific management, and aimed at coping with social change through administrative processes (Merriam 1937; White 1926). Moreover, these academics were not naive about practicing the political arts and often helped transform the practice by “besting” politicians (Gaus 1931, 1947).

An example of these principles in practice was the Tennessee Valley Authority (TVA). Created in 1933, it utilized professional management and appointed administrators to attempt the social and economic transformation of a region (Clapp 1955; Lilienthal 1944; Schlesinger 1958). Ironically the TVA was later depicted as preeminently political in one of the first studies of public organizations (Selznick 1949). Looking back, most see the TVA as a step forward in professional public management but seem to ignore its commitment to developing a more inclusive community.

Governmental management from this perspective sought to limit, if not preclude, political influences in solving public problems. The writings of John Pfiffner (1935) Fritz Morstein-Marx (1940), and Harvey Walker (1937) exemplified this anti-political philosophy centered on solving political problems with administrative techniques. Gulick and Urwick’s *Papers on the Science of Administration* and The President’s Commission on Administrative Management, the Brownlow Commission Report, both published in 1937, became the high points of the public interest orthodoxy in public administration theory (Gulick and Urwick 1937; Sayre 1958). Later critics claimed this

weakened individual choice and democratic responsibility as people could neither register preferences nor meaningfully participate (Denhardt 1981; Schick 1975; Stivers 1990).

Although several early university programs, such as the ones at the University of Cincinnati and the University of Michigan, ceased to exist, the decade of the 1930s saw a continuation of the study of public administration within university-based programs. Soon after its creation in 1926, the Public Administration Clearing House (PACH) became a most effective research center for collecting and sharing public sector research and expertise on a nationwide basis (Stillman 1982). Political scientists, however, found it increasingly difficult to accept a separate training role for public administration. They were establishing an academic discipline. At a conference sponsored by the PACH in 1935 at Princeton, public administration was perceived as needing a university-wide approach. Students could then gain “an appreciation of the responsibilities of public officers, their environment, relationships among agencies, and the political, financial, and legal foundations of public offices” (Caldwell 1965, 57). In contrast to Beard’s earlier call for practical training for public service, political science now altered its normative focus. Beginning in the late 1930s, it took an increasingly pluralistic approach to governmental studies (Gaus et al. 1936; Herring 1936). Building on the ROF model of governance, though often unconcerned with governance *per se*, political scientists began to question the role of a “professionalized” public administration.

Ironically, however, the national government’s social and economic responsibilities accelerated the demand for a more professionalized public service. The demand for a proactive public service required human relations and broad administrative and managerial skills (Egger 1975). In 1934, the US Civil Service Commission scheduled examinations for “professional positions” that provided career opportunities for college graduates in administration (Van Riper 1958). A series of treatises published in 1937 by the American Academy of Political and Social Sciences on “Improved Personnel in Government Service” underscored the need for a professional identity for public personnel and management (Dimock 1937; Gulick 1933, 1935).

By late in the decade, the unplanned explosion of the executive branch resulted in an institutional and managerial crisis (Egger 1975). Some called for legal and judicial controls on the expanding administrative process, ultimately leading to the passing of an Administrative Procedures Act in the following decade. Others focused on the managerial role of the president. The President’s Committee on Administrative Management (Brownlow Commission) extensively analyzed it. Their conclusions in 1937 emphasized the critical role of scientific study for governmental administration. The Commission recommended replacing uninformed judgment and political expediency in the planning and managing of public agencies in the new era (President’s Commission on Administrative Management 1937). They called for executive empowerment, suggesting a leadership style aware of, yet independent from, overt, pluralistic pressures (Karl 1963; Polenberg 1966). This reform recalled the ROF model by expressing a concern for the role of experts, but only as staff to an elected executive.

At the same time, Chester Barnard’s seminal work on executive roles provided a bridge between public administration and a more generic approach to management (Barnard 1938). It was the first conceptual piece to note the importance of the social side of management and to integrate it into the fabric of organizational administration. Management processes and activities, such as leadership and decision making, were seen as functional linkages between traditional scientific and more recent behavioral approaches. The organizational setting of modern management was perceived as both task and social system (Golembiewski 1977; Selznick 1949).

By 1939, seeing that academic trends in political science would not provide a suitable foundation for the growth and development of public administration, leaders of academic programs, training institutes, and professional associations met to establish national organization for improving the relationships between the academic and practitioner segments of the field. The resultant American Society for Public Administration (ASPA) sought not only to address the

lack of identity for public administration, academically and professionally, but also to develop a body of knowledge for the analysis, evaluation, and improvement of public sector management. Embracing both practitioners and academics, the ASPA provided for more effective applied research and increased communication about public administration issues.* Its publication, the *Public Administration Review*, provided a national forum for the exchange of ideas and research findings and an academically and professionally recognized voice to support and promote its goals and objectives (Martin 1952; Mosher 1975; Stone 1975). An organization separate from political science, yet inclusive of political scientists, ASPA provided a supportive environment for political scientists, other academics, and field professionals interested in the academic development and training of public managers.

IX. THE 1940s: REFLECTION ON THE ADMINISTRATIVE STATE

The decade of the 1940s saw public administration groping for an identity and significance apart from both the orthodoxy of the principles school and the increasingly pluralistic emphasis of political science. Early in the decade the application of scientific management principles, specifically, and the PI model, generally, to the public sector fell under increased questioning (Stene 1940). Many called for more information and data on the state of public administration education and its ability to address the needs of public sector management. Active collaboration between academics and public officials were advocated through innovative educational and training programs (Graham 1941). There was an explicit recognition of the role of democratic values in public management as well as an interest in how public management practices might be reconciled with those values (Appleby 1945; Beard 1941; Gaus 1955; Levitan 1943; Wengert 1942).

World War II accelerated several trends begun during the depression. One trend was the broad laboratory exposure of a large number of academics to actual government work in public agencies. This introduction to the realities of line management rather than staff responsibilities led to significant changes in the perception of public administration. Greater involvement with the natural science community was evident, starting with the Manhattan Project and its success in building nuclear weapons; the national government utilized natural scientists in university laboratories, especially in the area of national defense. These continued to grow in an era of cold war, as did the governmental use of the products of science (Price 1965). The expansion of government investment in social science research and its application during the 1960s and beyond would find a somewhat different reception given the emerging debate over the efficacy of science for dealing with social issues and the perceived different cultures of science and government (Snow 1959, 1961).

By the late 1940s, several shifts occurred in the basic orientation of the field. These emphasized (1) a shift from administrative specialties to line operations aimed at achieving public purposes; (2) a shift from the chief executive and auxiliary and control agencies to activities at the departmental or bureau level; (3) a shift from general, abstract principles to the varying contexts of individual departments and programs; and (4) a lessening of concern for efficiency and economy and more concern about the links between democratic values and administrative processes (Fesler 1975). Appleby (1945) formulated a new approach to leadership, building upon the traditional management norms, but recognizing their roles and limitations in the politico-administrative system. These reformulations reflected greater participation in an enlarged, intellectually driven national government.

An acceptance, albeit implicit, of the inevitability of big government prevailed. Not all, however, were pleased with this trend. Perhaps anticipating later difficulties, some questioned the excesses of governmental authority that they believed threatened democratic and individualistic

* Note the preposition is "for" not "of." Its use indicates an intention to emphasize the relations of the study to the practice as well as a more avocational stance toward the promotion of professional goals.

values. Their concern centered on the consequences of social and economic control in the hands of technically trained professionals (Hayek 1944; Von Mises 1944).

Such a view did not predominate, however. University research centers were again becoming active and their scientific and technological findings found application in the public sector. Stillman (1982) suggests that the arrival of the “professional state” (Mosher 1968) heralded a shift in thinking in public administration from a concern about the practical problems of government to a more detached, analytical, and process-oriented approach. Public and business management were seen as distinct concerns involving varying expectations about public agency ends and, therefore, not amenable to the same administrative practices or evaluations (Appleby 1945, 1949; Dimock 1945). The old politics–administration dichotomy was now inappropriate; public administration was increasingly viewed as a combination of individual and group behavior based on the interaction of social, economic, and political influences on policy and management decisions (Schick 1975). Case studies were gaining favor as an approach for analyzing administrative behavior within this new awareness (Stein 1952).

During the 1940s, serious discussion arose over the applicability of a science of administration. The critique was exemplified by Robert Dahl’s suggestion that a science of administration was questionable, especially if based on a mechanistic assumption about behavior. According to Dahl (1947), universal laws of a science of administration existed primarily in textbooks of public administration.

Herbert Simon argued further that the so-called principles of administration were nothing more than proverbs and, as such, provided little scientific basis for public administration. A logical positivist, Simon suggested an intensified effort to identify empirically based principles. The determination of such principles required a separation of fact and values (Simon 1946, 1947), a logical separation that produced echoes similar to those regarding the politics–administration dichotomy.

Dwight Waldo (1948) took a somewhat different approach. He reviewed the roots and developments of public administration within the framework of western and democratic values. In *The Administrative State*, Waldo demonstrated that there were fundamental flaws in the classical orthodoxy of public administration and suggested that significant problems arose from the application of those “principles” to public sector situations. He argued that there was little basis for a primacy of administration over the political process and urged a recognition of public administration within the context of a democratic governmental process.

With the demise of the classical orthodoxy in the 1940s came an increased awareness of the broader perspectives of the field. Interdisciplinary approaches gained importance. For example, the influence of sociological and psychological research on public administration was strengthened by the translation of the works of Max Weber (Gerth and Mills 1946). The relationships among organizational structure, authority, and individual behavior in large-scale, complex governmental organizations became evident. Unfortunately, Weber was read prescriptively, not descriptively. His research design and intent were lost in his conclusions about the efficacy of bureaucracy. These developments reinforced prescriptions for formal, inflexible governmental structures at the same time that the new field of organization theory was first applied to public administration (Blau 1956; Merton 1957; Selznick 1949, 1957). Later, organizational theorists would question the notion of a universal formal model and concentrate on specific contingencies (Koontz 1980; Scott 1961; Thompson 1967).

This decade saw the end of a tumultuous debate about regulation of the administrative process that had begun in the flurry of administrative action in the Roosevelt New Deal. The debate included a presidential veto of the first proposed Administrative Procedures Act in 1938 and ended, in essence, with a codification of the minority dissent to the recommendations of the Attorney General’s Committee on Administrative Procedure (1941). Later, in 1946, Congress passed the Administrative Procedures Act by an overwhelming margin, thereby clarifying

congressional-executive relationships and suggesting that the administrative process reflected an intermingling of political and administrative processes (Rosenbloom 1993a).

Federal and state judicial interpretations of the acts, however, often dulled some of their cutting edges. Amendments on items such as public access to official documents illustrated the inherent limitations of judicial control over the practicalities of administration (Schwartz and Wade 1972; Shapiro 1968; Warren 1982). A greater partnership between the courts and agencies (Cooper 1985; Melnick 1985), if not a “juridical” polity (Lowi 1979), was hoped for as the courts began to exert influence on many policy areas.

At the end of the decade, in 1949, the first Hoover Commission filed its final report. Officially called The Commission on the Organization of the Executive Branch, its ostensible purpose was to reduce the number of agencies. In the end, however, the report called for increased professional management and greater executive control over administration. Many of its recommendations were eventually adopted (Arnold 1976).

Many of the developments in this decade raised questions about the central unifying theme of public administration—the PI model—that had endured for nearly 40 years. No satisfactory replacement was offered, however, especially not one that could incorporate empirical analyses with the realities of administrative practice. More significantly, the demise of the old orthodoxy left the field without a normative base just as it encountered the first determined opposition to the enlarged functions of the administrative state.

X. THE 1950s: THE BEGINNINGS OF SELF-AWARENESS

The discrediting of the principles approach during the 1940s created a vacuum. Major effects to reshape the field arose during the 1950s. A central theme for these efforts was the recognition of the interdependence between political values and the administrative process (Caro 1974; Martin 1952; Sayre 1958; Waldo 1952; Waldo 1955; Waldo 1956; Willbern 1957). Some attempted to return to the earlier models of COF and ROF. The scope of public administration was enlarged, but little coherence for consolidating the study or the practice of public administration emerged (Landau 1962; Mosher 1956).

University research in public administration and policy increased as the academic community became more active in shaping and defining the field. The intellectual grounds existed for a rapprochement between political science and public administration, especially because the impact of political values and special interests (factions) on governmental administration was now widely acknowledged. Such did not occur. As public administration moved toward a more interdisciplinary and open-ended identity, political science became enamored of pluralism and behavioralism. Neither of these themes provided a suitable base for the nurturing of public administration with its institutional and professional concerns. Political science completed the normative shift begun in the 1930s; public administration lost its image as a “lusty young giant” (Landau 1962) and seemed awash in the non-training, pluralistic mode now dominating political science.

Pluralism, for example, left no normative role to public administration. It was only one of many governmental processes subject to the influence of political factions (Dahl and Lindblom 1953; Truman 1951). Like the legislative and executive processes, the administrative process was simply another pressure point for political influences seeking to serve their own particular interests. In essence, public management in the administrative state was added to the rule of interests *dramatae personis*. A public administration concerned about the ways in which policy was implemented or how public policy might reflect a public interest that went beyond the rule of factions seemed out of place (Fesler 1975).

Behavioralism further isolated public administration from the mainstream of political science. Building, in part, upon Simon’s call for increased efforts to use scientific inquiry based on a particular philosophy of science, the behavioralists severely circumscribed roles for political science. They focused their research on inputs, aggregates, voting behavior, and other quantifiable

facts rather than on the somewhat less empirically ascertainable behavior of individuals and institutions responsible for public policy. Behavioralism became the new orthodoxy for political science. Public administration, with its nonscientific concern with institutional dynamics and management training, was not political science.

Public administration, without its former principles, seemed increasingly unable or unwilling to construct a viable alternative to the behavioralists. It lacked both a sense of self-awareness and an intellectual substance (Martin 1952; Siffin 1956). A science of public administration became an endangered species in a discipline that would, later in the 1960s, virtually deny its existence (Landau 1962; Waldo 1968).

Nevertheless because most public administration programs were located within political science departments, the development of a self-aware, interdisciplinary public administration sensitive to political and societal values depended on frameworks developed within political science. Textbooks written during this period, principally by political scientists, began to include materials reflecting pluralistic and behavioral influences (Pfiffner and Presthus 1953; Simon et al. 1950). Early roots of a public policy focus were developed as attention was directed toward the politics of the policy-making process and the implementation of specific public programs. The mechanistic for was de-emphasized and the impact of values on public administration was highlighted (Golembiewski 1977). The increased use of the case study approach typified efforts to identify and explore specific administrative activities. The work of Lasswell suggested an interdisciplinary policy science focused on the concept of a policy system transcending both political science and public administration and thereby illustrated the emphasis on the policy process (Dror 1967, 1971; Lerner and Lasswell 1951).

The absence of a central dominant theme enabled public administration during the 1950s to absorb ideas and influences from a variety of sources. Modern public administration became concerned with any and all fields of knowledge appropriate to the functioning of individuals and organizations vested with a public purpose (Dimock 1958; Stover 1958). The more broadly written and methodologically sound research of sociologists like Merton (1957) and Selznick (1957) provided insights into large formal organizations characteristic of the administrative state. Moreover, the socio-psychological approach to face-to-face relationships and an appreciation of the informal organization increased the relevance of the human dimension in the study of public organizations. For the moment, at least, this dampened concerns about converting business and industrial models into public sector applications and permitted acceptance of much of the proliferating research pertinent to the study of contemporary organizations (Argyris 1957; Golembiewski 1962; Katz and Khan 1966; Likert 1961; March and Simon 1958; McGregor 1960).

When Herbert Simon (1946, 1947) identified the "decision" as the central event in administration, an interdisciplinary and generic focus for explaining organizational behavior was suggested. The location of some public administration programs in generic schools of management may reflect the impact of this approach (Caldwell 1965; Schick 1975). Although Dahl's criticism of Simon's "decisionmaking schema" questioned its suitability to public organizations and their decision-making processes, it still became a major consideration for the field (Dahl 1947).

A contrasting, though certainly compatible, rationale for public sector decision making was presented by Lindblom (1959). He identified the public decision maker as one who made decisions conditioned by a practical and "achievable" rationality (Lindblom 1959). In their own ways, both Simon and Lindblom depicted a process with a multiplicity of decision points, high degrees of fragmentation, and bounded rationality (Caiden 1991). In essence, administrative decision-makers sought to reconcile values of social harmony, stability, and unity within a fluid, unstable environment of competing political interests (Stillman 1982); in Lindblom's famous phrase, they "muddled through."

By the end of the 1950s public administration remained troubled by its lack of identity and focus, yet poised to clarify and renew its self-awareness. Pluralism and behavioralism created both opportunities and problems. Demands for systematic, empirical analyses of organizational behavior

within highly pluralistic settings energized an active research agenda. The findings emphasized variability and adaptability in public organizations. But when questions about actual administrative problems arose, the temptation to fall back on simpler prescriptive remedies remained strong (Divine 1955).

As the number of governmental functions expanded, demands for cooperation and integration grew. The need for competent professional public managers spurred an increase in the number of courses and programs offered in public administration (Somit 1956). Those providing academic and professional training became more self-conscious about the field. There was a greater sharing of information between university-based programs and public sector practitioners (Mosher 1956).

Yet concerns about the size and scope of government remained. The second Hoover Commission, created in 1953, called for the elimination of many government services, especially those it saw competing with the private sector (Mansfield 1969). In contrast to the experience of the first Hoover Commission, few of the recommendations of the second were ever accepted.

With the publication of the *Administrative Science Quarterly* in 1955, research on organizations and their behaviors became readily available. The research emphasized the interactions of organizations and their environments. Public administration seemed ready to end its culture-bound perspective. The interdependencies and linkages between economic development and comparative politico-administrative systems were gaining recognition (Etzioni 1961; Lawson 1959; Riggs 1956; Siffin 1957).

XI. THE 1960s: BEYOND POLITICAL SCIENCE

Entering the 1960s, many thought that policy analysis could guide selection among program alternatives. Others believed that a maturing scientific and technological base opened the door for a public administration that could be both rational and pluralistic (Campbell 1972). Similarly the application of operations research and systems analysis to public problems (Quade 1975) opened new managerial insights and applications.

Unfortunately these hopes were limited by the realities of the political process (Lindblom 1965; Schattschneider 1960; Schlesinger 1967; Waldo 1961). The largely incremental legislative decision-making processes, for example, limited the use of planning-programming-budgeting (PPBS) at the national level (Botner 1970; Schick 1966, 1973) as it did later efforts to apply rational financial decision making through zero-base budgeting in the 1970s. Nonetheless, benefits for administration came through the greater participation of program managers in a more decentralized process (Moore 1980; Draper and Pitsvada 1981).

President John F. Kennedy's pledge that the United States would go to the moon in the 1960s was fulfilled by the National Aeronautics and Space Administration (NASA). When fulfilled, this boost to the national psyche did more than catch up with the Soviets. NASA's focus on project management, the organization of the task system around jobs rather than a hierarchy, moved public management toward increased flexibility (Cleland 1983; Martin 1976). Theoretically, organizing around projects mixed people based on skills and remixed them upon completion of the project. Most fully conceptualized as matrix management or matrix organization (Davis and Lawrence 1977), the lessons from NASA have seldom been applied generally to the movement for public-private partnership, even though NASA and private contractors were intertwined in its project matrix. Conceptually, project management was an updating of organizational principles based on the premises of the PI model.

The increased acceptance of science and technology fostered a relationship between public administration and the use of that technology to assist in cross-national development. The comparative and development administration movements of the late 1950s grew out of the effort to provide technical assistance to developing nations. Young behavioralists in political science, under the direction of change-oriented academics, formed the Comparative Administration Group (CAG) as part of ASPA in 1970 (Jones 1976; Savage 1976). CAG spearheaded the publication of the

Journal of Comparative Administration and promoted a cross-disciplinary approach to the analysis of government mental bureaucracies (Riggs 1964; Heady 1996).

Largely theoretical in its emphasis, the CAG faltered in the aftermath of the doubt and pessimism that arose later in the decade and existed throughout most of the 1970s (Heady 1979; Waldo 1976). Vietnam, increasing uncertainty about the environment, perceived failures in the Great Society programs, Watergate, and a general antipathy about the efficacy of science and technology, as well as the government's ability to apply it effectively, removed much of the basis for its promise (Waldo 1971; Waldo 1984). Although comparative administration remained on the agenda of public administration into the 1970s, the focus became more middle range and institutional (Jreisat 1975). The change in the name of the *Journal of Comparative Administration* to *Administration and Society* in 1972 was indicative of the declining interest in the area. The general turmoil of the decade, from civil rights demonstrations to anti-war activities, affected general Public Administration as well. The responses to these events unfolded in the 1970s and later as a new generation entered the academy and the practice. The era was indeed a discontinuity from the past (Drucker 1969).

Others based in political science built upon a policy process approach to public administration and sought to bring about a merging of the systems approach (Churchman 1968; Kast and Rosenzweig 1970; Schoderbek 1971) with science and technology (Denny 1967). The application of operations research and the desire to quantify research on administrative behavior are specific examples (Campbell 1972). Some, like Dror (1967, 1968), took exception to the domination of policy analysis by economic decision theory and behavioralism. He suggested that the use of such techniques be tempered by the inclusion of qualitative factors and their impacts on public policy processes. At the same time, Downs' application of economic principles to bureaucratic structures and behaviors suggested a relationship between economic norms and individual value choices (Downs 1957). He later illustrated the relation of bureaucratic policies and practices to individual norms and attitudes (Downs 1967). Building on the view that public administration was part of a generic approach to organization and management, others noted that individual values and roles were significant factor in determining organizational behavior (Bennis 1966; Likert 1961; Prethus 1965).

Although the number of schools and colleges of administration peaked in the 1960s (Caldwell 1965; Schick 1975), efforts to clarify the identity of public administration led a new generation of academicians to articulate an approach reflecting previous developments, while seeking independence from both political science and the administrative management school (Frederickson 1976). Like their counterparts in the CAG (Najjar 1974), they were frustrated with the apparent intellectual estrangement of public administration within political science and the lack of attention to values in the administrative management approach (Marini 1971). At a conference called by Dwight Waldo at Minnowbrook, they argued for a separate identity for public administration based on relevance, participation, change, values, and social equity. Their new public administration (NPA) was policy centered, projecting a normative, proactive role for public managers (Barton 1980; Ramos 1972; Richter 1970). Drastic changes in the established procedures and outcomes of public policy were advocated (Frederickson 1974; Schick 1975). The NPA challenged public administration's commitment to professionalism, credentialing, hierarchy, and value neutral management. Their normative commitment to democratic values promoted client control, decentralization, and value consensus (Bennis 1965, 1969; Campbell 1972). The prescriptive thrust of Minnowbrook expressed some of the themes that later reemerged in the electoral trends of the mid-1990s and subsequent efforts to redirect the focus of public administration (cf., Drucker 1954, 1959).

Indicative of a reawakening of public administration to a rapidly changing and politically volatile society, the values promoted by the NPA were difficult to translate into the practice of public administration. However, increasing numbers began to voice concern about the relevancy of professional education and training to the needs and aspirations of organizational members, clients, and even society. Later generations would raise similar concerns and issue a call for reinventing government.

As early as 1959, public administration education leaders demonstrated their concern for the nature and quality of professional public service education by organizing the Council on Graduate Education for Public Administration (CGEPA). The CGEPA authorized an omnibus report on the status of education for public service. Completed in 1967, the Honey Report documented the inadequacy of public service education, especially in a time of increased opportunities and demands for public service professionals (Honey 1967). The report offered numerous suggestions and identified a need for remedying many problems. It also emphasized developing a coherence and identity for public administration, both as a discipline and as a focus for professional development. Honey reiterated and expanded the call for change in public service education along the lines suggested earlier by Dwight Waldo (1965).

The debate and dialogue over educational programs for public service rekindled interest in the development of an identity for public administration (Miles 1967). The hope was for a broad reconciliation among the many interests of the field. Academic program content, the creation of a disciplinary focus, and effective career development were prioritized. Forums for the discussion of the “scope, objectives, and methods” of public administration were held (Charlesworth 1968). Political science came under increasing attack as an unsuitable “homebase” for public administration (Hinderaker 1963; Charlesworth 1966, 1968). Waldo, among others, made the point clearly by suggesting that public administration needed to identify its central core and to recognize that its future lay in the development of a “professional” stance, broad and flexible enough to encompass the diversity of interests found in public administration, yet firm and understandable enough to provide unity and a sense of purpose and direction (Waldo 1968).

At this early juncture, however, efforts to clarify public administration’s identity were limited. Most public administration programs were still located in political science departments. Many lacked the needed enthusiasm for supporting visible, high-quality professional programs. Also, the traditional political science base for public administration was eroding under the expanded roles played by other academic disciplines within public administration (Waldo 1975). The results left an increasingly eclectic public administration in search of new footings. Waldo’s call for public administration to “act like it was a profession” even though it might not really be one was insufficient in this regard. Critics underscored the lack of the trappings of a profession, such as codes of conduct, the ability to control membership entry, and the absence of a recognized body of research and writing specifically related to professional concerns (Schick 1975; Schott 1976). Later studies attacked what they termed “sociological” definitions of profession. Using a more traditional notion of profession, they urged public administration to become truly professional (Green et al. 1993).

By the end of the decade, however, there were several unmistakable trends. The need for and interest in providing an identity for public administration and understanding better its roles and substance was generally accepted. The neutral competent, value-free emphasis of public administration as conceptualized in the PI model was functionally reinterpreted. The debate over values in public administration was now focused on their nature and direction rather than on whether or not values properly had a place in the field (Gawthrop 1970; Hart and Scott 1971; Redford 1969). Some perceived the development of public administration as a craft more so than either an art or a science (Campbell 1972; Berkeley 1975). Lastly, questions of identity were not answered solely on the basis of particular disciplinary characteristics, but also on the basis of program content and professional responsibilities.

XII. THE 1970s: IDENTITY REVISITED, NEW CURRENTS AND CURRICULUM

Society and government during the 1970s reflected ambivalence about the future. Differences over civil rights, Vietnam, Watergate, and the energy crisis questioned previously held assumptions about the relationship between individuals and governments, intergovernmental responsibilities, and international relations. Public administration would bear the blame for many perceived

governmental weaknesses, while being expected to herald positive changes in administrative patterns (Waldo 1972).

Both academics and practitioners felt increased stress and pressure. The need for a merging of the scientific and the political became more explicit. For the practitioner, critical issues included public productivity during a time of decreasing resource availability, the need for reorganizing administrative structures and delivery systems, greater attention to the needs and interests of clients, and the relevance of policy outputs to societal needs (Campbell 1972; Etzioni 1967). Pressures grew for diversity in the practice of public administration as well as for the development of a more visible and consensual academic view of the field.

Suggestions for change ranged from those proposing new central theories to replace the old "orthodoxy" (Landau 1972; Ostrom 1974) to those urging a multi-disciplinary, pluralistic focus (Waldo 1975; Frederickson 1976). Others called for a concern with social equity and justice, often based on Rawls' (1971) work. Contradictory views were common (O'Toole 1977). Those supporting the interests of the NPA movement proposed to discredit the value-free rational bureaucratic approach and urged the opening of the study and practice of public administration to humanistic and democratic influences (Crozier 1964; LaPorte 1971; Levine et al. 1975; Price 1975; Savage 1976; Wilson 1975). Others resisted such efforts, claiming that the rule of law should not be replaced by a system of administration based on the rule of men (Thompson 1975). Bureaucracy's death was forecast by some (Denhardt 1981), while others predicted it a more positive outcome (Miewald 1970). Professional managers and other leaders in public affairs indicated some acceptance of the NPA agenda as they saw a need to shift priorities. They recognized the worth of the individual, the need for public service to become more sympathetic and responsive to heterogeneous political and social desires (Berkeley 1971), and the need for increased attention to professional career development programs to handle technological change and innovation (Chapman and Cleaveland 1973). A major career development program was the Federal Executive Institute (FEI) and its sister agencies, the East and West Management Development Centers (Buchanan 1973). FEI helped to spawn similar efforts in many states.

Out of the civil rights movement of the 1960s came new criticisms of the PI model and its merit system. Equal employment opportunity and affirmative action initiatives sought to eliminate discriminatory practices and enhance opportunities for the disadvantaged by opening up the recruitment and advancement processes to more minorities and women (Nigro 1974). Although the initiatives were based more on legal mandates than on calls for popular sovereignty or individual values, supporters of the PI model questioned the long-term consequences of such changes. Others, in contrast, stressed the compatibility of a merit system and equal employment opportunity (Kranz 1974; Reeves 1970).

In the early 1970s, Vincent Ostrom called for a shift in focus from bureaucracy and the Wilsonian model (that he argued was biased in favor of a strong, centralized executive system) to a decentralized, dispersed service delivery system somewhat akin to the COF or ROF models (Ostrom 1974). He envisioned public administration as a responsive service delivery system, a multiplicity of democratic decision points as well as a dispersed system of administrative authority with overlapping jurisdictions and fragmented organizational patterns. By including the work of political economists in explaining public administrative behavior, Ostrom believed decisions about administrative policies should include concern about competition and alternative delivery systems (Ostrom and Ostrom 1971).

Along related lines, another effort to develop a central theory was concerned with agency outputs and the trade-offs between public and private goods. Questions about the boundaries between public and private were partially delineated through the use of economic concepts (Wamsley and Zald 1973a, 1973b; Caiden 1991). A variety of paradigms for the field appeared as the search for central theories continued (Ostrom 1974; Henry 1975; Golembiewski 1977). Though these seldom reached scientific maturity, they invigorated the search for an academically acceptable identity. One paradigm calling for a merger of pluralism and political

economy was timely, though its feasibility was subject to question. Critics of Ostrom's thesis pointed out its apparent inability to explore and explain the complexities of the field (Ostrom 1977; Stillman 1976). Furthermore, its methodological approach was deemed simplistic and somewhat unrealistic in its assumptions about the outcomes of democratic administration (Golembiewski 1977). Moreover, what some termed "policy subsystems," a relatively small group of administrators, legislators, and lobbyists who controlled basic public policies (Freeman 1952; Kingdon 1984; Seidman 1970; Walker 1974) seemed to be legitimated by Ostrom. Some researchers examined public administration in terms of networks of organizations. This perspective focused on how organizations of all types were connected to policy making and implementation (Keller 1984; Milward and Wamsley 1985).

During the 1970s, efforts increased to incorporate more systematic and applied research methods to solve governmental problems (Eddy and Saunders 1972). Knowledge management was promoted as a tool for providing a more responsive and responsible public management (Bowman 1978; Henry 1974). Public productivity (Balk 1978) and the development of theoretical and practical approaches for dealing with a public sector facing declining resources and stable, if not increasing, service demands became agenda items (Levine 1978). Policy analysis was touted as a way to sort out priorities, avoiding the "muddling through" that Lindblom trumpeted (Beckman 1977). Once again private sector management techniques were deemed desirable and applicable for public sector use. To improve the quality of work-life while also increasing employee and agency productivity, organization development was identified and promoted (Golembiewski 1978, 1980; Golembiewski and Eddy 1978; McGill 1974).

The federal government expanded its role in shaping state and local policies during this decade. Many federal grant programs required the use of a merit system. Also, the federal government called for coordination of grants and policies at the regional level. They required a regional body, a Council of Governments, to review grants in many areas. In some cases, these bodies assumed considerable authority over time, such as the Greater Minneapolis COG. Most became heavily involved with transportation and environmental policies, helping to prioritize projects among local governments.

As pressures mounted for a more representative public service, so did calls for a review and reform of the leadership and accountability aspects of the merit system. Presidential frustrations with a career service seemingly immune to executive leadership, an enlarged manpower pool, and the need to enhance the image and responsibilities of the professional career service prompted President Carter's initiatives for merit system reform. On the advice of leaders in public service education and practice, President Carter applied contemporary management techniques to federal management. The roles of executive leadership and responsibility were strengthened (Beam 1978; Campbell 1978). At the onset of the reforms, few perceived conflicts between expanded executive control of the public service and continued professionalization at the highest levels.

By virtue of the Civil Service Reform Act of 1978, public service professionals were less constrained by a process-oriented personnel system. Merit-based pay provisions and a Senior Executive Service emphasizing productivity and flexibility were mandated. The hope was to reverse the "triumph of technique over purpose" lamented by Sayre (1948) in his examination of personnel administration. Following the 1980 election, the Reagan administration, sensing a mandate for less government, used the provisions of the reform mandate for the selection of political appointees who pushed for limited, if not scaled down, government programs and a diminished influence of professional managers in policy making (Carroll et al. 1985). Once again, the ROF model seemed to gain new life.

The efforts by the Reagan administration provided a fertile environment for those public administrationists and public interest adherents who questioned the reforms. Their fears that political values might again become the criteria for decisions in public personnel management (Thayer 1978) seemed to be supported. Even those in the public service were somewhat reserved in their support of the

reforms. Not surprisingly, public support for reform seemed to be greater than that found among professional public employees (Lynn and Vaden 1979).

While the applied side of public administration struggled with changes in expectations during the 1970s, efforts to move forward with an agenda for public service education flowered. The NASPAA succeeded CGEPA in 1970. Working with the insights of the Honey Report and considering other studies identifying the future needs for public service (Chapman and Cleaveland 1973), NASPAA set about to create an educational and professional base for the development of public sector managers. NASPAA focused on building an identity based on a consensus regarding educational curricula and programmatic characteristics. The consensus would provide coherence in the field and empower organizational authority for a professional approach to public administration education and training (Uveges 1987). NASPAA's development and support of curriculum components representative of the cross-disciplinary character of the field was generally welcomed by those providing professional education for public service. NASPAA's "Guidelines and Standards for Master's Degree Programs" were broad and flexible, providing identity as well as responsibility to public administration programs. They included major academic and professional features found in most programs (NASPAA 1974, 1976). The university's role in clarifying the nature of the field was strengthened, as was the special relationship between the Master of Public Administration (MPA) degree and professional career development for public service (Grode and Holzer 1975; for an earlier analysis, see Walker 1945).

Field identity and coherence were substantially reinforced during the 1970s by the introduction of new scholarly journals. Regional journals such as the *Midwest Review of Public Administration* and the *Southern Review of Public Administration* began. By the early 1980s, however, interest in public administration research had grown to the extent that these journals adopted new names more indicative of a larger audience: the *American Review of Public Administration* and the *Public Administration Quarterly*, respectively.

Amid the support for NASPAA's efforts, questions still remained. To bring conformity among MPA programs, NASPAA approved a process of voluntary peer review. Some concern was evidenced about the link between the peer review process and some possible future effort to enter into a formal accreditation process (Engelbert 1977; Thayer 1976). Additional cautionary issues included how the standards and NASPAA's role would impact the relationship between NASPAA and ASPA (Thayer 1976); whether or not the standards focused attention too heavily on techniques and pedagogy, foreclosing diversity and innovation (Howard 1975); and the issue of professionalism and its relationship to public administration curriculum (Schott 1976). On the whole, however, considerable support was generated for NASPAA's initiative and for realistic efforts to ascertain the parameters of the field. The need to measure quality profession-oriented education for the public service was increasingly acknowledged.

XIII. THE 1980s: CROSSCURRENTS AND A RETURN TO BASICS

Professionalism in governmental administration came under increased scrutiny during the 1980s. Although the initial skepticism was most evident at the national level, even state and local governments faced increasing pressure to make administrative policies more responsive and reflective of societal and political trends.

Early on, the Reagan administration initiated controls on the size and scope of the national government. The Grace Commission called for a distinctly businesslike approach to governmental management and a limitation on the degree to which professional public managers, as opposed to political executives, were exposed to direct political pressures (Goodsell 1984). Some saw this as requiring a more active and interchangeable role for the private sector in meeting public sector needs (Savas 1982). Boulding (1981) inferred that the future shape of both government and non-government could dramatically change through short-term incremental shifts that would evolve

into new “niches.” The outcome would create multiple opportunities for administrative diversity and provide a basis for the private sector to offer public services (Behn 1980; Ingraham and Barrilleaux 1983; Lewis and Logalbo 1980; Schacter 1983).

The effort to offer public services through nonpublic privatization gained the most momentum at the local level, especially in metropolitan areas. Central cities found it an attractive alternative in light of increasingly tight budgets and prospects of less federal aid. Their efforts often met with opposition from well-organized unionized employees often represented by very strong traditional groups such as the Fraternal Order of Police. Where such employee organizations were more limited, such as in suburban cities, privatization gained greater momentum. However, in most cases, the gains from privatization were minimal: in some cases, the public employees organized and made lower bids than private firms. Nevertheless, as a result of the bidding process, governments did realize some savings, as in Cleveland where public employees won a bid against outsiders, lowering the cost by \$2 million (Janik 1995). In the 1990s the call for privatization directly fed a growing movement to reinvent government.

In the 1980s, state and local governments were called on to bear increased responsibility for their administrative policies. Bureaucracy was no longer, if it ever was, primarily a national phenomenon. Between 1950 and 1980, state and local bureaucracies went from 4 million to more than 13 million employees (Van Riper 1983). Much of this growth was financed by the national government. Now state and local governments were asked to assume greater responsibility for policies and financial support for public programs.

In addition, the continued growth of the national debt and demands for less national bureaucracy seriously curtailed national efforts to assist state and local efforts. To adjust for these changes, in 1989, Mississippi’s governor, William F. Winter, was authorized to chair the National Commission on the State and Local Public Service (Winter Commission), aimed at recommending reforms in state and local administrative practices (see Winter 1993).

At a time when the need for increased formal training for managers was mandated (Newland 1979) and when decentralization and productivity were trumpeted as effective ways to resolve the problems of the 1980s (Gulick 1983), public administration faced new challenges. These challenges helped feed a growing interest in strategic planning for governmental administration. Originally conceived as establishing direction for a corporation, the planning perspective was vitally important for public administration.* This perspective helped sort out alternative policy directions and was applied in tandem with organizational development (Eadie and Steinbacher 1985; Olsen and Eadie 1982). Even states noted for the partisan nature of their politics, such as Ohio, implemented strategic planning on a broad scale. At the local level, it tended to be used selectively, aimed at priority items such as police services (Levine 1985). Strategic planning was often combined with innovative procedures, such as negotiation techniques, to ensure that those responsible for implementation buy into the process (Fisher and Ury 1981; Gargan and Moore 1984) with issues analysis (House of Representatives 1983).

The 1980s also reflected efforts to resolve problems of low esteem and professional identity for career public servants (Riggs 1983). Productivity and accountability measures were developed in ways to increase flexibility and effectiveness (Pffiffer 1983). Professionalism and ethics took on added importance (Bowman 1982; Frederickson 1993; Golembiewski 1983; Rabin 1981, 1985). Increased professionalism and ethics were seen as the key to a more knowledgeable and responsible career executive at the state level (Daley 1983; Mertins and

* Jim Paisley, who worked with the strategic Management Group at Deloitte, Haskins and Sells, used the phrase “direction establishment” to capture the purpose of strategic planning for the private sector. Given the fact that for public agencies the legislature and other external bodies often establish much of the direction for a public agency, it has been difficult to transfer the technology of strategic planning from the private to the public sector. However, the strategic perspective is useful to public administration, although it would seem to unnecessarily limit its potential by combining it with the budgetary process (Olsen and Eadie 1982).

Hennigan 1982). In 1984, ASPA approved a code of ethics that further narrowed the gap between the practice of public administration and its status as a profession. By 1985, public administration was seen to possess many of the trappings of a profession (Daniels and Johansen 1985). Later, a reconceptualization of professionalism would be formulated, one that better comports with the original meaning of profession and to a public sector profession of governance (Green et al. 1993).

Field identity and recognition continued high on the agenda of public administration academics. The availability of resource materials and literature in public administration was at an all-time high (Rouse 1982). NASPAA's peer review process gained general acceptance. By 1985, 81 master's degree programs had achieved roster status, with the impact of the process most important in curriculum content and program jurisdiction issues (Uveges 1987). NASPAA was recognized by the Council on Professional Accreditation in 1986 as the accreditation unit for master's degree programs in public administration.

Interestingly, just at the time when it seemed likely that the issues of field identity and professional responsibilities were on the way toward resolution, efforts by the Reagan administration to reshape the administrative state appear to have reignited an age-old controversy within the field: the politics-administration dichotomy. His vision of the American politico-administrative system did not have Bill Bureaucrat as an active policy player (see Appleby 1945). President Reagan saw the relationship between politics and administration (though as much rhetoric as program statement) as being based on the individual independence that Jefferson saw in "yeoman" and a private sector along the lines that the liberals in Europe supported (see Stillman 1982, in Uveges 1982).

While emphasizing the rights of individuals, the Reagan administration paradoxically pursued economic policies that threatened a classical, free enterprise system. The implicit vision was of a government that would serve only as the infrastructure for independent and sturdy Americans and their international corporations. There was little recognition that independent individuals and international economic organizations may have inherent conflicts. In essence, a limited role for the national government in social and economic affairs was the aim.

Professional (career) administrators' discretionary powers were more limited. Operationally, both Presidents Carter and Reagan attempted to reduce the presence of civil service appointees in policy making. They increased the number of appointments based on political (value consistent) rather than career (merit) bases. The movement was back toward a separation of political and administrative roles, with the policy questions answered by politically appointed officials. Carroll et al. (1985) called these new types of managers supply-side managers, and noted "[s]upply-side theorists in administration will almost certainly be disappointed, however, by their efforts to revive the politics-administration dichotomy." Others called for the revitalization of public service (National Commission on the Public Service 1989).

In like manner, Burke (1983) suggested that the realities of the politico-administrative system may not limit professional influences on public sector policy and management. However, a clarification of their roles and expectations within the politico-administrative system was required. Svvara (1985) sees such clarification as better recognizing contemporary trends in the more sensitized political and professional roles of governmental managers.

The reemergence of the politics-administration dichotomy may have deeper roots. Though practitioners and theorists in the field recognized a need for change, calls for less activism on the part of public administrators and other experts may represent a basic shift away from the PI model. The Reagan-Bush administrations reflected a greater openness to the ROF model, although modified for the realities of the professionalization of American life. The demand for less expert-objective-dominated administration seemed to be a reaction to the degree to which professionalism increased organizational performance, while generating a psychological longing for more socially intimate contacts (Broder 1980; Naisbitt 1982; see Green et al. 1993). The demand for more "human centered" workplaces and more responsiveness to shifts in political values asserted the "values" of a

democratically oriented public service (Frederickson and Hart 1985) where “benevolence” was related to “patriotism” as an appropriate method for serving a political community.

It is sobering to note that some research has found an irony in democratic administration by suggesting that the satisfaction of the workforce may be inversely related to the satisfaction of the clients (Katz 1975). More interesting, however, may be to note that as early as 1902, Jane Addams foresaw much of the behavioral and political consequences of a professionalized public administration as defined by the public interest model.

...The well-to-do men of the community think of politics as something off by itself; they may conscientiously recognize political duty as part of good citizenship, but political effort is not the expression of their moral or social life. As a result of this detachment, “reform movements”, started by business men and the better element, are almost wholly occupied in the correction of political machinery and with a concern for the better method of administration, rather than with the ultimate purpose of securing the welfare of the people. They fix their attention so exclusively on methods that they fail to consider the final aims of ... government. This accounts for the growing tendency to put more and more responsibility upon executive officers and appointed commissions at the expense of curtailing the power of the direct representatives of the voters ... [T]hey speak and write of the purification of politics as of a thing set apart from daily life.

On the other hand, the real leaders of the people are part of the entire life of the community they control, and so far as they are representative at all, are giving a social expression to democracy. They are often politically corrupt, but in spite of this they are proceeding upon a sounder theory [than the reformers]. [...] living near to the masses of voters, and knowing them intimately, [they] recognize this and act upon it; they minister directly to life and to social needs. They realize that the people as a whole are clamoring for social results, and they hold their power because they respond to that demand. They are corrupt and often do their work badly; but they at least avoid the mistake of a certain type of business men who are frightened by democracy, and have lost faith in the people. (Addams 1902:223-225)

The feelings of exclusion and lack of control by clients and citizens evidenced as the 1990s began could also account for the renewed legislative interest to review and change structures that under the PI model were considered the essence of administration (Yates 1982).

Some public administrationists perceived the problem and sought explanations and resolutions (Stever 1988). For example, the Public Administration Network was started toward the end of the decade as a counterrevolution to the dominance of behavioral methods in research. Some believed the detachment of public administration resulted in great part from how science was defined under behavioralism. They called for a redefinition of science and knowledge that could tie public administration to the community. This perspective echoed the concerns of the earlier Minnowbrook conferences that had criticized public administrators for refraining from correcting social problems (Bailey and Mayer 1992; Frederickson 1980; Marini 1971). The reaction to behavioralism was also based in part on the inability of research from that perspective to handle issues such as professionalism and the role of public administrators in the governance process (Adams and White 1994; for an early reaction to behavioralism in politics, see Dahl 1961).

Concerned with a dearth of normative theory in the discourse about governance, the network facilitated a 1987 conference at Lewis and Clark College, from which a set of papers was published looking at how to conceptualize public administrators (Kass and Catron 1990). The volume borrowed its methodology from Gareth Morgan (1986), who advocated a new methodology called *imaginization*. This methodology analyzed organizations in terms of the images created by different theories. For those writing papers for the conference, the roles and even the nature of public administration were developed in a series of images, such as the administrator as tortured soul (Harmon 1995). The conference demonstrated the utility of nonbehavioral methodology and the necessity of examining the origins and contexts of views of public administrators (Waugh 1992).

XIV. PUBLIC ADMINISTRATION IN THE 1990s: RESHAPING MANAGEMENT, SEARCHING FOR MACRO LEGITIMACY

The 1990s followed a decade of major transitions, especially in how the field was viewed by the public and many elected officials at all levels of government. Elected officials increasingly questioned the utility of dealing with professional administrators. This skepticism was especially new at the national level. Previously, presidents had often found utility in having the bureaucracy staffed by professionals, perhaps to avoid the adverse consequences of patronage best expressed by Lincoln. Lincoln sarcastically noted that patronage tended to produce one ingrate and ten enemies. In spite of the difficulty of filling high-level appointments, and of keeping incumbents for any period of time in such positions, presidents in the 1980s and 1990s resorted more and more to policy, if not patronage, appointments. (Of course, some agencies had earlier experienced such political utility, especially the General Services Administration and the Post Office. These agencies have offices in most congressional districts and are therefore most amenable to patronage opportunities.)

At the state and local levels, the animosity to professional public administrators was less new. In many cases professional appointments had never occurred or were relegated to clerical and other positions that had limited utility for patronage purposes. Sadly many in the public did not distinguish professional from nonprofessional administrators and had an all too ready propensity to lump all those who worked in government into the hated category of bureaucrat.

In light of these difficulties, the search for more secure foundations took several different forms. Some criticized the attitude of elected officials and the public, while others advocated changes in public administration based on the criticisms voiced by some elected officials, the media, and the public. As with most controversies in a modern extended republic, knowing who the public was and what their concerns were was difficult to discern. Further complicating these issues was the manner in which contemporary media reflected and influenced the agendas identified as being relevant for discussion. Nevertheless, the opposition to government was palpable and growing, with few in the media and the public apparently distinguishing professional from nonprofessional administration. Some opposed taxes per se, disregarding the purposes for which the taxes were raised and the economic and social policies a tax may involve (Steuerle 1992).

Two camps emerged in the reaction to the discipline and the profession. One concentrated on the governance roles of public administration, recalling older arguments and recasting new approaches to the administrative state. Rosenbloom argued that Congress and the Judiciary were helping to “retrofit” the administrative state to the Constitution (Rosenbloom 2000a, 2000b). Some critiques followed in the footsteps of Waldo, examining how managerialism promoted a perverse political philosophy. Stivers and King (1998), for example, opined about the stifling effects of professionalism qua expertise on an active citizenship. Such perspectives, however, were seldom informed by political history (Morgan 1988). Others warned about generally treating citizens as customers (Frederickson and Chandler 1984; Perlmutter and Cnaan 1995). Some of the critiques appeared to deviate from Waldo’s general support of an active field, if not a governing profession (Adams and Balfour 1998, 2004; Farmer 1998).

The second camp followed in the footsteps of Herbert Simon. They called for a new public management, one that eschewed the exposed homilies of the traditional public management and implemented a science driven service delivery that was effective and efficient (Brudney et al. 2000; Dilulio et al. 1993) for a range of views, some of considerable vintage, on management and administration, but emphasizing the latter, see Stivers 2001). In the same general vein, many championed e-government, the offering of services over the Internet. Many in this camp prophesized that the harnessing of technology would achieve both robust management and convenient democracy (Garson 1999; Accenture 2001). For example, the 2004 website of a major consulting organization for e-government, Accenture, formerly the consulting partners of Arthur Andersen, touted:

From the United Kingdom to the United States, Belgium to Brazil and Malaysia to Mexico, governments are talking about the significant benefits that can be realized by migrating traditionally paper-based and face-to-face services to the Internet. Governments also understand these services must be customer focused, cost effective, easy to use and value-added for citizens, businesses and the governments themselves.

Those concerned with the administrative state and the governing function of public administration addressed several issues. For example, the politics-administration dichotomy that had reappeared in a new garb was reexamined critically. In his intriguing piece, Roberts (1994) traced the rise and persistence of the dichotomy to a strategy of the Rockefeller Foundation for funding government research. Fearing the backlash that would likely happen if the Rockefeller money was perceived as spent in a political fashion, the Foundation could support public administration if it were divorced from politics and empowered to deal with a broad range of public policy. The Foundation was highly supportive of people, such as Brownlow, who advocated the desirable dichotomy by empowering administrators in the making of policy.

For some, the doctrine was not a romantic relic of a distant past, but a highly useful guide to administrators in dealing with current issues and problems. Montjoy and Watson (1995) honed the concept by noting it had both policy and institutional implications. They found the doctrine useful in dealing with "particularisms," such as patronage, in local politics. Their reconceptualization reinforced Svava's (1985) revision of the dichotomy, where he pointed out that the dichotomy was part of a larger division of functions. Svava perceived four functions (mission, policy, administration, and management) that were performed in an effective governmental system. He criticized how existing notions ignored the mission duties of government and the roles of public administrators in defining mission. The traditional myopic view of the dichotomy reduced the capacity of government to plan strategically and create policies reflecting visions of desirable futures. It also prompted elected officials to spend inappropriate time on management. Svava concluded that the four functions were shared in council-manager systems, contrary to the neat separation envisioned by the dichotomy. Thus, one reaction to the increasingly anti-professional politics was to interpret the past more carefully and create powerful, normative guides for professional administrators as well as clarify the historical record.

More fundamentally, the refounding movement that surfaced in the mid-1980s when a group of faculty at Virginia Tech issued their Blacksburg Manifesto took on additional importance (Wamsley 1985). The manifesto aggressively defended a policy role for public administrators. The book, *Refounding Public Administration*, when published early in the 1990s, built on earlier efforts such as John Rohr's award winning volume, *To Run a Constitution*. Rohr (1986) argued for constitutionally based policy roles for administrators by tracing the foundations for these roles to both the Federalist and anti-Federalist perspectives at the time of the founding of the republic (See also Cook 1992, a more realist view is Riggs 1994). Others saw peril in such roots because they were packaged with slavery and other undesirable values (Spicer and Terry 1993).

Refounding for these intrepid academics was a process, or dialogue, aimed at critically evaluating foundations and past practices. The focus was more on current norms and ethics than accurate portraits of past systems or a concern for improving managerial techniques. The politics-administration dichotomy was of minor interest and was perceived as having, at best, some utility for administrators if their policy roles were questioned. Gary Wamsley (1990), for example, argued for an agency perspective. For him, administrators were agents for a variety of principals. The tension produced by multiple principals both enlarged and confined the domain of administration. Since recent history indicates a primacy for presidential administrative dominance, a more effective administration would allow administrators to avoid control by only one principal. A more constitutionally based system, according to Wamsley, would remove administrators from domination by the presidency; however, it also exposes them to the problem of multiple principals, a not insignificant concern when the branches are controlled by different parties, and more importantly, different

ideologies (Public Administration and the Constitution 1993). It also raises critical issues of ethics to which the field responded (Bowman 1991; Cooper 1994; Rohr 1976,1989).

Another contribution to the refounding literature was Terry's (1995) argument for redefining leadership. Terry uses Selnick's notion of institution as an organization endowed with values of the community, and his argument that leadership in administration should focus on turning organizations—instrumental entities—into institutions, or value-laden enterprises. He further asserts that a public leader should “conserve” those values central to his/her agency. Such a leadership concern does not rule out change; however, change is supported according to whether core values are furthered.

Furthermore, Goodsell's resounding defense of bureaucracy notes its functional aspects. Further building on his popular book, *The Case for Bureaucracy* (1994), he sees the bureaucracy as a desirable necessity insofar as it provides accountability for the actions of public servants. Bringing credibility back to government is seen more as a process of rediscovery than one of reinvention (Goodsell 1993; Moe 1994).

The citizen's place in defining public administration is identified when Cam Stivers (1996) incisively questions how citizens are viewed by our political and administrative theories. As she insightfully observes, most theories presume a quiescent citizen, contented to be led by those who hold key positions in government and left with no functions to perform other than the selection of some leaders who will be humbly served once they are installed. Similarly, she suggests, the field is burdened by underlying and only haltingly recognized problems with race and gender, particularly the latter (Gallas 1976; Guy 1993; Meyer-Emerick 2001; Naff 1994; Stivers 1993). Interestingly, affirmative action has seemed to create a more diversified federal service (Keller et al. 1994).

All in all, the refounding movement attempts to protect, if not enhance, the policy roles of public administration in the administrative state by more carefully conceptualizing these and creating appropriate norms based on the Constitution. In the process, key components of public administration have been reinterpreted (Terry 1995) and/or called into question (Lane and Wolf 1990; Luton 1994; Stivers 1994). In addition, some, in particular David Rosenbloom, recalled the importance of law to public administration (Cooper 1988). Rosenbloom interpreted the Administrative Procedures Act (APA), adopted overwhelmingly by Congress in 1946, as part of creating a “legislatively centered Public Administration” (Rosenbloom 2000b). This approach complemented calls for a more broadly rooted public administration, going beyond traditional administration centered on the chief executive. Interestingly, Rosenbloom (2000a) noted that the empowerment of the Office of President by public administrationists such as Brownlow was the result of erroneously perceiving public administration as universally applicable in any system and thus the president, charged with the executive function, should oversee administration at the national level. In essence, the perception of public administration as outside of politics mooted the issue of its constitutional position within the American system. Wamsley and Schoeder (1996) analyzed the “quagmire” of emergency policies and pointedly noted how modern media can further enhance the Presidency at the expense of constitutional and institutional design. In contrast to Behn's (1995) list of the three big questions of public management, John Kirlin (1996) emphasized the seven big questions of public administration in a democracy and Neumann (1996) emphasized more enduring questions of the practice. Terry (1998) cautioned that the assumptions of the new public management could promote managerial behavior that conflicts with constitutional and democratic values. Both the calls for law and the design of governing systems emphasized the importance of structure to politics and administration (Elkin and Soltan 1996).

Unfortunately, the focus of much of the refounding effort has been almost entirely on the national level and does not note the very different conditions of state and local government (Winter 1969). In contrast to the highly philosophical and theoretical questioning of basic values and institutions of the refounding movement, the focus at the local level has proceeded mainly from a managerial perspective, the Simonian legacy, concentrating on improving service delivery and

measuring if the improvements did in fact occur. Almost two years after the publication of the refounding volume, a former city manager and a consultant argued that public administration needed to be reinvented (Gaebler and Osborne 1992). They found administrative stagnation, along with a largely ineffective and inefficient delivery of public services. This unfortunate state of affairs, they suggested, derives from a refusal to reconsider the tenets of the field and to update these by liberating managers from the heavy hand of unexamined tradition. Unless we liberate, the authors argued, public services shall lag far behind what they could be and continue to foster negative feelings among citizens. The solution is to rethink how government is structured and empower the service provider, perhaps by having nongovernmental organizations offer the service or services (Bellone and Goerl 1992; Nathan 1995; Perlmutter and Cnaan 1995; Terry 1993). Others noted the need for, and improvements in, measuring the effects and assessing the success of local policies (Ammons 1995; Behn 1995; Poister and Streib 1995; for an overview of public management at this time, see Bozeman, 1993).

More ominously for the governance functions of public administration, the role of the city manager continued to be a major concern. ICMA itself became split on the issue of whether the office of city manager as traditionally developed could, or should, be sustained. Some argued for transforming the office into more of an executive partnership, involving the office of mayor in a serious manner (Frederickson 1995; Frederickson and Nalbandian 2002; Svava 1994). Cincinnati, long one of the most traditional council-manager cities, amended its charter to enlarge the role of the mayor in the selection process of the city manager and, more generally, in the political process. Though ICMA did not oppose the change in the Cincinnati charter, the Ohio City Management Association publicly opposed it. In addition, some managers called for the creation of a Staunton Society, dedicated to supporting a more traditional model of the city manager. The issue, though centered on the council-manager form of government, is similar to those involving high-level public servants in all levels of American government.

The Clinton administration joined the effort to transform the national bureaucracy. Vice President Al Gore, a person long interested in the application of technology to improving government, was placed in charge of the reinvention effort. He approached the task as a true believer, aiming at permanent changes in how services are offered (Executive Office of the President 1993, 1995). Access to the process was broadly expanded through the use of modern telecommunication facilities such as the Internet. In fact, by the mid-1990s, many aspects of the national government, and a growing number of state and local governments, were on the Net, complete with home pages that permitted those who surfed the Net to peruse many documents and use e-mail to interact with those engaged in the effort to change government. Such access promised to make government more available to citizens, though some questioned who the users were and how representative they were of citizens in general.

The diversity of issues and approaches appear, on the surface, to lack unity in either scope or method. Those refounding the field question the desirability of reinventing government (see Goodsell 1993), but seldom engage in meaningful dialogue. Those intent on reinventing appear uninterested in the larger philosophical issues around the public sector and its reform. However, progress in both cases may require conceptually relating these and other movements, such as the extent to which public administration has an adequate conception of the state (Stillman 1991) or adequate conceptions of professionalism (Gazell and Pugh 1993; Green et al. 1993). In addition, it may require a more unified conception of the environment (Etzioni and Lawrence 1991). Yet, NASPAA continued to review and accredit programs at the graduate level in public administration (Williams 1994). In a most unexpected manner, the debate was pre-empted in early 2001 with a direct and devastating attack on American soil. Ironically, the reactions to that attack may require public administration to turn serious attention to governance on the basis of political philosophy as well as efficient management. To this event and its aftermath we now turn.

XV. CONCLUSION: PUBLIC ADMINISTRATION AND THE SEARCH FOR GOVERNANCE IN A GLOBAL SECURITY STATE

September 11, 2001, threatened to change the face of American government. President Bush announced we were in a state of war and requested the creation of a Department of Homeland Security.* American troops were quickly dispatched to Afghanistan and toppled the Taliban regime. The resulting reorganization of the national government was the most extensive in our history. Public administrationists quickly theorized about its implications, for a variety of issues from management to civil liberties (see the Special Issue of the *Public Administration Review* 2001). Spicer and Gould worried about the implications for civil liberties and even the basic nature of our government. Frederickson and LaPorte questioned the capability of a rationally driven traditional management to accomplish security while Wise and Nader as well as Kincaid and Cole explored the effects on federalism. O'Toole and Hanf provided the broadest perspective, analyzing the effects of international governance on the American system. The range of concerns about the effects of what came to be called 9/11 indicates the scope of change the event wrought, and may yet wrought, on the American republic.

Whether the changes will continue for the long term is an open issue. However, as the theory on complex systems notes, changes are irreversible. Systems cannot “go home again”—that is, return to their original states (Holland 1995; Prigogine and Stengers 1997). However, the eventual outcome is seldom predictable as a range of outcomes is possible. This theoretical approach will be returned to later as it promises to help public administration avoid the determinism of some scientific paradigms while applying a robust theoretical framework. The stakes are indeed perilously high for where the American system may go under pressure of a global concern with terrorism. Much may depend upon the extent to which public administration can articulate and implement a public management attuned to core political and constitutional values in the context of a community as well as organizational efficiency (Newland 1984).

In essence, the discipline and profession of public administration will have to make stronger connections between the Waldo and Simon legacies (Kaufman 1996). This will be a difficult task. However, some public administrationists are responding to the task, analyzing management in the political context of constitutional government. Bertelli and Lynn (2003) phrased the issue pointedly:

... a central theoretical (but also quite practical) problem of Public Administration: deriving from our historical experience a role for administrative officers as practitioners of statecraft..., rather than politicians, clerks or anything else of lesser constitutional significance.

However, to achieve this noble and what many would agree is a necessary goal requires a clear understanding of the shortcomings of many aspects of current public administration. More importantly, the field must communicate those shortcomings to the public, eschewing what seems to be an American penchant for believing in technical silver bullets. Too often, Americans expect science to deliver a solution that requires no trade-offs and blessedly bypasses the messy politics that seem unnecessary in an age of sophisticated technology and wide-spread, if costly, higher education. Public administration must assume its constitutional role in systemic politics without losing its expertise in management or supplanting other constitutional actors.

*The irony of calling a federal agency Homeland Security in a nation built on immigration and replacement of those inhabiting the land at the time of immigration seemed to escape notice. Moreover, the name has a chilling resemblance to European ministries, such as the infamous Ministry of Interior, which often became the point of attack for those wanting to take over a state. In any event, it is an unfortunate name for a federal agency. Some of the content recalls the ill-fated Alien and Sedition Acts that helped to undo the administration of John Adams and the Federalists generally.

Similarly, many have hopes that the technical efficiency can be tamed by placing it under the discipline of the market and the logic of economics generally. This logic of economics, particularly in terms of comparing costs with benefits of public policy, has assumed a large role in many forms of policy analysis (McKean 1958). At the national level, it was first mandated in the case of water resource projects. By the 1980s, some advocated the privatization of public services (Savas 1982). Politically, the market was promoted in developed and developing countries, apparently fulfilling both the yearning for material well-being and the hope for democratic politics. In essence, public administration was to be a player in the service market, competing with not-for-profit and for-profit firms. The result was to be both efficiency at the organizational level and democracy at the systemic level (Donahue and Nye 2002). Similar hopes exist for utilizing technology in public management and service delivery (West 2004). However, even the World Bank has cautioned about ignoring the governance capacity when implementing market and other reforms (Kaufman 2005).

Surprisingly, Jefferson's hopes for small-scale democracy, one that he perceived as threatened by urban and other forms of complex development, is now visualized by some as the outcome of technology and management in a complex society. It is not that these efforts have no merit; the concern is a tendency to promote them as panaceas, total solutions to what is often perceived as a malfunctioning system. They ignore, as Goodsell (2004) continues to point out, that the system is healthier than many understand and that any thrust painted as a systemic solution ignores the inevitable trade-offs of any vision or the dark-side of the "iron cage" of organizational efficiency, if it is elevated above other political values and designed beyond constitutional restraints (Bendix 1960).

As emphasized in the second edition, difficult questions may be posed for public administration as the republic enters its second century. It was noted that the foundations—the PI model—must be tempered by connecting professional concerns with social needs, while avoiding the corruption and petty partisanship that Addams (1902) noted around the turn of the century. It was stressed that this requires an emphasis on governance by placing administration in our politics. Such a focus facilitates the incorporation of many lessons from other fields into public administration for example, quoting from that edition,

Michael Saranson (1972) expanded the prescriptions from organizational development into more general ones on the nature of societies and their futures. Similarly, Cobb and Elder (1972) emphasized the importance of agenda building, an activity obviously important for public administration, but one that has eluded conceptual inclusion (Allison 1971; Cobb and Rochefort 1994; Kingdon 1984). Most importantly, a focus on governance can provide a constitutional foundation to an active public administration. As Lowi (1995) notes, we have in many ways failed to conceptualize adequately the constitutional context of our politics. Without more robust conceptualizations, we will fail to ground public administration constitutionally and deny it a meaningful role in governance (Freedman 1977).

Not surprisingly, the current field, reflecting social and unconventional political struggles across the globe, resists classification in a classically rational manner. Intellectual synthesis is unlikely to succeed if it is conceptualized as creating a dominant and all-explaining theory.* As

* A pertinent parallel may be the inability of Albert Einstein to create a unified field theory for physics. In fact, he opposed the approach of Niels Bohr who explained micro level events from a statistical perspective. For Einstein, this nullified the potential of a robust science and in a quaint metaphor, Einstein opined that "God does not play dice." For all his contributions and even charisma, Einstein lost the argument over the nature of science within physics. Ilya Prigogine (1997) sees the integrated notions of a science from a traditional rational perspective as erroneous. Prigogine notes that the Newtonian explanations may be appropriate for a subset of systems but not for the general ones. Thus, complex systems of any type may preclude easy generation of universal laws and thwart attempts to comprehend complex systems with traditional logic, or even non-traditional logic (Holland 1995). Several approaches from this perspective, such as Holland's, have much promise for a more robust empirical picture of public administration and better capture the nuances of the normative side. ASPA recently created a section on complex systems and named it in honor of Sam Overman. This illustrates that many see the utility of the perspective for understanding American public administration.

Burrell and Morgan (1979) note, one's journey has a start that in many ways determines routing and destinations. Paradigmatic assumptions vary according to the assumptions researchers make and create a diversity of scientific methodologies. Particularly important in terms of intellectual starts is how one sees human nature and the resulting social system. If one starts with assumption of innately good people, one will propound a very different public administration than if one starts with a notion of people as equally likely to do evil as good. For a most interesting study of dramatically different outcomes based on how administrators are perceived, see Anechiarico and Jacob's examination of anti-corruption strategies and their influence on public administration (Anechiarico and Jacob, 1994). These incompatible paradigmatic assumptions, and similar ones about basic notions of linear cause and effect, are likely to continue in public administration. In fact, they may be necessary to understand the state in a complex global system with a technological base that can threaten the system itself. (See Jun 2002 for readings on these topics; Sorensen 2004).

A revealing episode is the clash around administrative responsibility triggered by reviews of Michael Harmon's (1995) book, *Responsibility as Paradox: A Critique of Rational Discourse on Government*. In a spirited dialogue on the book, Terry Cooper and Harmon in particular engage in a ringing debate over the issue (1996). The dispute is not just over reaching different conclusions; it also involved quite different paradigmatic assumptions. The inability to reach an accommodation in that dialogue reflects that fundamental assumptions lead to incompatible outcomes, even in traditional areas of public administration.

Ironically, the resulting messy intellectual landscape may prove most useful to governing a diverse and ever-changing global society. The utility requires creation of, and incorporation into, academic degree programs, of the products of science defined as a process of inquiry rather than any particular paradigm (Mesaros and Balfour 1993). In essence, students must be paradigmatically aware and able to gather lessons from a variety of perspectives without oversimplification or a belief in the dominance for all public administration of one particular approach. In addition, students must have a fuller understanding of our actual history and the resulting lessons for the systemic importance of administration (Hoffman 1998, 2002; Lynn 2001; Riccucci 2001; Rutgers 2003). These lessons must be integrated at the organizational level with public management theory and at the systemic level with political philosophy. Similarly, informed comparative studies from a more philosophical perspective may prove very useful (Rohr 2002).

Theoretically, approaches such as complex adaptive systems may be quite useful. Emanating from places of intellectual investigation such as the Santa Fe Institute, researchers perceived similarities among systems, whether natural or social, if they were complex. Such systems behaved quite differently than simpler systems and demanded newer methodologies reflecting more complex behaviors. John Holland (1995), for example, argued that urban history could be usefully understood from this perspective. He regretted that most of our mathematics were based on linear assumptions and thus of limited utility for investigating the behavior of complex systems. Political systems certainly qualify as complex and the application of CAS may help to delineate the roles of public administration in such complex systems. Most usefully, the theory relegates the often deterministic nature of many social science epistemologies to simple systems. Complex systems may have a limited domain but the outcomes and evolution are not easily predictable and result from the action of numerous agents who are significant information centers of the system. The perspective is obviously relevant to the systems in which public administration is often embedded and notes the importance of how administrators act, even on what may seem minor issues.

Without such conceptual integration, public administration will be unable to perform its indispensable role of facilitating the governing of the state in a democratic constitutional manner (Newland 2000). Anything less would be to leave the administrative state in peril, as the rule of faction, thanks to the rise of a fearfully effective organization of political campaigns, may well create a coalition of factions that endangers democratic politics itself. Only a more robust public administration, incorporating the norms of its actual public interest heritage, can help to maintain, and ideally enhance, the constitutional foundations of the administrative state.

XVI. DEDICATION

I dedicate this history to those who toiled in the field, often with little acknowledgment but with a burning commitment to robust research, empowered teaching, and public service to American communities. Dr Joseph Uveges, who co-authored this chapter for the first two editions and who enlisted my services, is an exemplar of those who created and moved our field. I dedicate this version to him and them with thanks and gratitude.

I. INTRODUCTION

Public administration is a subject of human inquiry with ancient roots. Contrary to present practice, the ancients were preoccupied with governance of the public as affairs, not business. As found in Greece, they disdained commerce and management of business enterprise. Ancient empires created elaborate state structures and effectively operated an apparatus overseeing huge territories.

China gave the world the first civil service system some two thousand years ago, and the Roman Empire set the structures of governance (e.g., the organization of the executive branch into five main agencies) that many modern European states borrowed in their development (see e.g., Heady 1996; Wren 1994).

The study and systematic development of public administration in America, however, is scarcely more than a century-old phenomenon. It is a field of study that continuously adapts, both in practice and theory, to the government's and the society's changing nature. Often, public administration is characterized as an application of social and other sciences to public problems, which allows it to bridge disciplines (Frederickson 1976, 152). Constantly trying to define itself, public administration draws from multiple sources with an effort to reconcile often contradicting views.

Coping with the field's perpetual "identity crisis" (as coined by Dwight Waldo in the 1960s) and in search of answers that are in step with the times, academics and practitioners of public administration consistently reflect on several key issues: Where does politics stop and administration begin? How can employees be led, motivated, and protected from political excesses? How different is public management from private management? What is the necessary scope of government's services? What, and how much, should be centralized or decentralized? How can the public sector achieve efficiency and effectiveness while balancing those concerns with equity in service delivery? Who should govern, and what is the role of experts and expertise in the process of governance? What is the nature of public interest if there is one? Some questions pertain to the realm of political theory that underlies the field, and others refer to more pragmatic concerns of public administration's applied practice.

During the evolution of American public administration, these questions were often framed through public discourse in a much simpler, sharper, and sometimes conflicting pattern. The discourses often rejected established mentalities and are cast in dichotomous terms (i.e., administration is *different* from politics, public management is *different* from private management). They were often used as powerful rhetoric to advance the development of the field (Roberts 1994).

In some form, during the century-long development of American public administration theory, key issues were articulated by scholars of administration from different perspectives. Several ideas caught the spirit of the times, although they never received simple or final answers in administrative studies. Catalyzed by events and problems that caught the public's attention, such ideas were able to command significant amounts of scientific effort and advocacy. Each marked an era in the evolution of the field. For example, Frederick Taylor's system of industrial shop management was viewed by Progressives such as Louis Brandeis (who coined the term "scientific management") as a means to improve railroads' productivity, helping prevent fare increases. Following Congressional hearings on Taylor's methods that resulted in their banishment from the federal government, Taylor and others continued to publicize the concepts of scientific management. The concepts were widely embraced by many in the private sector (Wren 1994). Similarly, Whiting Williams' pioneering work in developing the human relations model (i.e., industrial sociology) in the 1920s did not take hold until the social sciences were an established, significant field of study in the 1930s. At this point, the academic credentials of researchers at Harvard and M.I.T. made the case for that model through the Hawthorne studies (Wren 1994). It is useful to study the evolution of thought about public administration through the prism of the issues and concerns that shape the field.

As a relatively new and applied field, management and public administration are always adapting to changing socio-political and economic conditions. As a result, they are difficult to classify. The most popular and fruitful approach to teaching public administration theory is to trace its evolution through time and by putting different theories in their historical context. As Gulick comments, "the global content of the field of public administration is set by the environment, not by logic; if government does it, it is 'public administration'" (1990, 602). The pursuit of effective public sector administration may be explained as a series of ideas, each representing a step or

increment toward a complete theory of public administration. None is comprehensive or complete. Taken as a whole, they do not preempt possible future insights. With each successive limited emphasis, public administration is a closer approximation to desirable administration. Taken separately, each emphasis may be considered more as a complement to, rather than a substitution for, others. Viewed over time, they helped build a substantial reservoir of knowledge. Although the history of insights into public administration is neatly divided into discrete periods, that neatness can be unnecessarily arbitrary, seeming to confine any one idea or perspective to certain years. For example, the following approaches are often confined to certain dates (e.g., McCurdy 1972; Nigro and Nigro 1973):

- Administrative Reform Movement: 1870–1926
- Orthodox Period: Administrative Science Movement: 1906–1952
- Politics Period: 1936–1967
- Human Relations and Behavioral Science: 1933–present
- Program Effectiveness 1964–present

Hard and fast divisions are also misleading if students then presume that each successive school displaced its predecessor based on the correct core idea of an emerging new school. Public administration might be more clearly described as a series of continuing and overlapping insights with none that have been supplanted. From the rise of the administrative state to date, society's governance has become more and more complex with old problems unresolved and new issues emerging. New insights or new theories of public administration are constructed to reflect new aspects of changing administrative practice. Working together, they demonstrate a whole and real public administration.

Since the 1960s, rigorous theoretical attempts have developed taxonomies of management theories according to their approaches and emphases on different aspects of management (both public and private). Perhaps the most basic division of management theories, one that in some form is acknowledged by every student of organizational theory, is to emphasize either general, scientific principles of management (basically structure and process) or to emphasize human behavior in organizations. Koontz (1961) was credited with the concept of the “management theory jungle,” wherein he identified six schools: (1) the *management process* school, (2) the *empirical* school, (3) the *human behavior* school, (4) the *social system* school, (5) the *decision theory* school, and (6) the *mathematical* school. Although clear, this taxonomy of approaches to management was neither systematic nor based upon consistent criteria. For example, an empirical (research methodology) study can be mathematical (tools) and focus on human behavior (content). A 1962 symposium at UCLA addressing Koontz's article questioned the universality of management theory (including public and private spheres). It concluded that there were language differences in different schools that drew from different sources (Wren 1994, 355–357).

In pursuit of a more rigorous taxonomy of the field, organizational science drew from the work of Burrell and Morgan in *Sociological Paradigms in Organizational Analysis* (1979). They classified all theories of organization (Figure 2.1) according to their approach to science (along the continuum subjective–objective) and approach to society (along the continuum of radical change–regulation). Burrell and Morgan (1979, 3) define a subjective viewpoint as focusing on “an understanding of the way in which the individual creates, modifies, and interprets the world in which he or she finds himself,” and an objective viewpoint as looking for “universal laws which explain and govern the reality which is being observed.” The other dimension stems from what Burrell and Morgan call “order–conflict” debate in sociology. This refers to whether the theory tries to explain the order of cohesive human systems or it tries to account for radical change. Later, Morgan (1997) identifies eight theoretical frameworks as eight metaphors in organizational theory: organization as machines, brains, cultures, political systems, psychic prisons, flux and transformation, and instruments of domination.

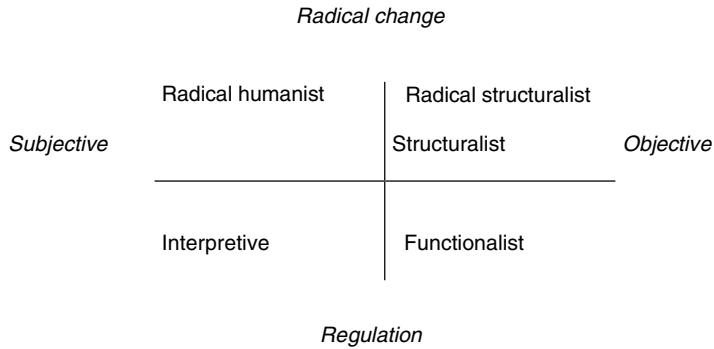

FIGURE 2.1 Burrell and Morgan’s classification of organization theories. (From Burrell, G, and G. Morgan, *Sociological Paradigms in Organizational Analysis*, Heinemann, London, 1979. With permission.)

In the 1980s, Quinn (1988) developed a competing values framework (Figure 2.2) classifying management theories according to their approaches toward control or decentralization (along the axis control–flexibility) and their focus on the organization’s internal or external endeavors (along the axis internal–external). Quinn’s holistic approach to the competing theories asserts that successful organizations and managers should balance capacities that reinforce each model rather than excel at one of them; otherwise, narrowness will leave them vulnerable to competing claims that organizations typically encounter. Since the 1970s, such calls for a holistic approach have been a part of mainstream organizational thought. Here, the public productivity movement was launched to synthesize different schools of management in the context of enhanced organizational practice.

One problem with Quinn’s methodology is that Taylor’s and other studies in the category of the rational goal model are not exclusively externally oriented. Additionally, all classifications have characterized Taylor’s model and the internal process model as being essentially the same—the classic bureaucratic or closed model. Perhaps, instead of the control–flexibility differentiation, rewording of that dimension to certain–uncertain (simple–complex; structured–loosely coupled) will better explain the stress of Taylor’s scientific management on getting the most out of a

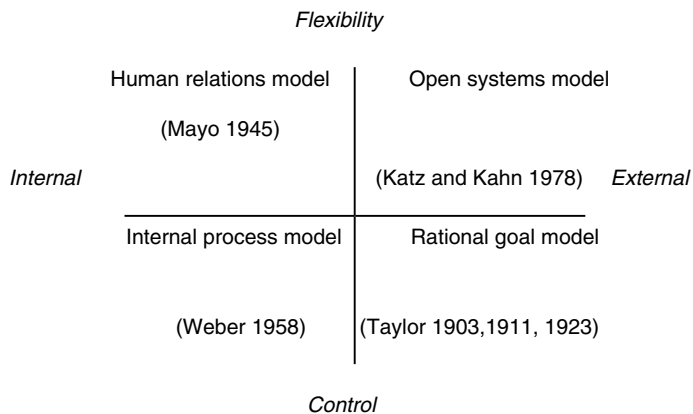

FIGURE 2.2 Quinn’s classification of organization theories. (From Quinn, R.E., *Beyond Rational Management*, Jossey-Bass, San Francisco, 1988. With permission.)

given stable set of conditions as well as Weber's emphasis on coordination in large and complex organizations.

More theoretical attempts at multi-paradigm or meta-paradigm theory-building exist (e.g., Gioia and Pitre 1990). Although the problem of theoretical reconciliation of conflicting paradigms is not an easy one, it is a problem with a solution. Each of the paradigms addresses a separate field of activities or the same activity in different situations; therefore, different approaches are complementary or can coexist. Each theory or paradigm draws from a set of core beliefs or a certain ideology. Without discussing these ideologies, conflicting beliefs can peacefully coexist (albeit with tension). In Mary Douglas' group-grid typology of culture, four basic and exclusive cultural assumptions about society—hierarchy, egalitarianism, fatalism, and individualism—can be held by the same person or organization (e.g., as a parent, one may be a hierarchist; as a citizen, an individualist; as a religious person, a fatalist; as a professional, an egalitarianist) because they are context-specific (Thompson et al. 1990).

Within public administration literature, there are classification attempts as well. Because of its multi-disciplinary nature, public administration resists classification. Along with a multiplicity of perspectives from general organization studies, it also has legal and political frameworks of reference. Because of diverse and often conflicting perspectives, Waldo (1961) calls organization theory in the context of public administration an "elephantine problem." Notwithstanding the variety of approaches to the field, theories of public administration can be broadly classified as coming from two directions—administration or politics—or as having micro and macro concerns: management of public organizations and the role of bureaucracy in the framework of constitutional democracy.

In the first direction, management of public organizations, two basic models can be recognized: the classic administrative model (from Taylor, Wilson, and Weber to Simon and March) and the human relations model (from Mayo and Follett to Golembiewski and Argyris).

The second direction, bureaucracy in the framework of constitutional democracy, is more diverse because of its close bonds to the fields of political science, economics, and sociology as well as its larger scope (society at large). For instance, Hill (1991) classifies theories of bureaucracy according to the end result—the impact they prescribe to bureaucracy in governance. This classification has three main categories or theories: (1) bureaucracies are (or should be) weak and instrumental; (2) they are significant actors in political process; and (3) they dominate the policy process. Each of these perspectives has its variations from pure pluralism to interest-group liberalism to Marxism and elitism. Cook (1992) classifies theories of bureaucracy's role along institutionalist (hierarchist) and functionalist lines. Wood and Waterman (1994) distinguish between normative and empirical research. Despite the diversity of approaches, only a few resulted in a shaping influence on the field. One influential stream of thought in this direction is the public choice school (Niskanen 1971; Ostrom 1977; 1989b; Ostrom and Ostrom 1971; Williamson 1975) with its application of economic logic to political and social life. To this line of argument, there has also been the constant reminder that a theory of public administration is a theory of politics and society (Waldo 1990).

Most attempts to classify public administration theory have been positivistic. Frederickson (1976, 153), for example, argues for a more critical "new public administration," yet he still recognizes five models of public administration based on a definition of theory as "positive or empirically based knowledge." The models he identifies are classic bureaucratic (Gulick and Urwick 1937), neo-bureaucratic (Simon 1947), institutional (Lindblom 1959), human relations (McGregor 1960), and public choice (Ostrom 1989b) as well as the new public administration with more humanistic, equitable, and democratic values as opposed to the previous ones that focused primarily on efficiency and effectiveness. Rosenbloom (1983) distinguishes the three historical approaches to the theory of public administration as *managerial*, *political*, and *legal*. Based on stratified systems theory, Burke (1989) suggests the following essential themes for the development of the field: the relationship between theory and administration; employment; bureaucracy; public interest; and a definition of public administration. Stillman (1995) identifies six schools of the "refounding public administration" movement

developed since the 1970s: (1) the “reinventors” who use an eclectic approach catalyzed by Osborne and Gaebler (1992); (2) “the communitarians” who emphasize citizenship, family values, and civic participation; (3) the Blacksburg Manifesto (Wamsley 1990) “refounders” who try to extend the meaning of public administration from mere management of public organizations to a larger and more legitimate understanding of it as a part of governance; (4) the interpretive theorists and post-modernists who emphasize the human condition in a society dominated by organizations; (5) the “tools approach”—with a leading theme that today, with a burgeoning of the not-for-profit sector in delivery of public services, there is no one best way of approaching the administration of services, even at the federal level; and (6) the new bureaucratic perspective whose main emphasis is on bureaucratic accountability in a constitutional democracy.

Along with these divergent approaches, there is also a sub-surface stream of comparative public administration (e.g., Heady 1996; Riggs 1994a; 1994b; Willoughby 1919). Although the American public administration community has been distinctly myopic and self-centered, the comparative public administrationists persevere in demonstrating the utility of cross-cultural studies.

Since the 1970s, scholars acknowledge that the field of public administration is very complex and must satisfy multiple, often competing, values. Frederickson (1976), for example, notes that models of public administration have tried to maximize some values at the expense of the others, while other values were also legitimate. In the tradition of Waldo, Stillman (1976, 1991, 1995) argues for multiple perspectives in the field. Since the 1970s, there has also been the growth of postmodern, interpretive, and critical analysis of public administration (Denhardt 1981; Farmer 1995a; Fox and Miller 1995; Harmon 1981; Hummel 1994; Jun 1986; Kass and Catron 1990) with a focus on human experience in organizations and bureaucracy. Fox and Miller (1995) discussing public administration in the postmodern tradition, distinguish three discourses that shaped public administration: orthodox, constitutional, and communitarian.

Some fundamental ideas or values have been identified as major forces shaping the field. Gulick (1990) contends that American public administration is fundamentally tied to four, sometimes inconsistent, principles of social organization: democracy, individualism, specialization, and the market. Kettl (2000) emphasizes an understanding of how political traditions shape administrative theory and how administrative theory brings political traditions to life. Kettl identifies the Hamiltonian, Jeffersonian, Wilsonian, and Madisonian traditions as major bedrocks of American public administration (Figure 2.3). As Kettl argues, most administrative approaches flow out of these traditions one way or another.

	<i>Wilsonian Hierarchical</i>	<i>Madisonian Balance of Power</i>
<i>Hamiltonian</i>	Strong executive	Non-bureaucratic institutions
<i>Strong executive/Top-down</i>	Top-down accountability Hierarchical authority	Focus on political power Top-down accountability
<i>Jeffersonian</i>	Weak executive	Non-bureaucratic institution
<i>Weak executive/Bottom-up</i>	Bottom-up accountability Responsiveness to citizens	Focus on local control Bottom-up responsiveness

FIGURE 2.3 Administrative ideas in the American political tradition. (From Kettl, D.F., *J. Public Admin. Research Theory*, 10(1):7–34, 2000. With permission.)

FIGURE 2.4 Denhardt’s classification of public administration theories. (From Denhardt, R.B., *Theories of Public Organization*, 2nd ed., Wadsworth, Belmont, CA, 1993. With permission.)

Denhardt (1990, 1993) provides the most sophisticated analytical typology of public administration theories. Drawing from Burrell and Morgan (1979) typology for organization theories, Denhardt develops a typology for public administration. Denhardt’s classification (Figure 2.4) abandons the radical change–regulation (or normalization) dimension, and instead introduces the more relevant politics–administration dimension. This classification significantly improves Burrell and Morgan’s classification in terms of its applicability to public administration. This substitution of dimension can be justified on different grounds. For example, some theorists argue that public administration theory is geared to the production (or efficiency) ethic, and it is aimed at normalization of the society and the bureaucracy. However, it fails to discuss alternative liberation ethics (Farmer 1995b). Public administration theories in the United States, though always concerned with a good life and more democratic administration, were based on the premise of a democratic political system (the US ideal-type model) and never espoused an ideology of radical change based on Marxist or other understandings of politics. Instead, the politics–administration dimension highlights the unique character of public administration (the difference from generic management) and the central dilemma of its identity. One problem with Denhardt’s classification is that, as opposed to Burrell and Morgan’s typology, the criteria involved are heterogeneous, for subjectivity or objectivity (as well as change or adaptation) is a matter of general methodology while organizations or politics are more objects of study than mode of analysis.

Denhardt’s model also resembles Quinn’s (1988) competing values model with the possibility that one can be translated into another. Assuming that (1) public agencies are political in their nature in that they carry out a political function in their external activities with regard to other agencies, legislatures, people (clients), and organizations, and (2) knowledge of objective reality (certainty) enables us to plan and control while subjective understanding supposes multiple and competing interpretations of reality (uncertainty) and calls for a more flexible approach. These two typologies can be juxtaposed. Of course, these assumptions are good for drawing parallels only; the criteria do not translate into each other directly and should not be treated literally.

The resulting double classification (Figure 2.5) provides a rich analysis of public administration theories. First, it indicates the link between public administration to management and organization studies. Second, it helps to underscore the difference between public and private management, and it hints to where they may be more alike. Third, it helps to explore, compare, and contrast epistemological underpinnings of theory (subjective–objective) with its more pragmatic concerns (control–flexibility) as well as to look behind what seem to be instrumental categories (e.g., what type of rationality is implied in the rational goal model). Fourth, one aspect of the criteria employed (political–organizational and control–flexibility) is more homogeneous, and they both relate to the

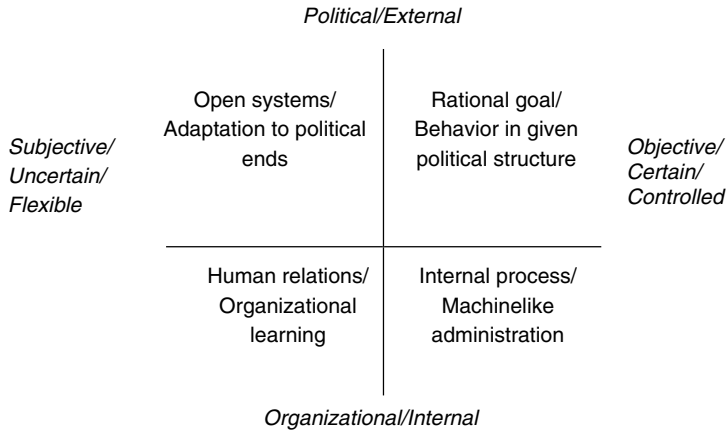

FIGURE 2.5 Dual classification of public administration theories.

object of study. It once again shows that different approaches to administrative theory can and should be reconciled on a practical level, encompassing elements from each quadrant of the diagram. Productive public agencies should carry out the political function they are created for and behave politically (e.g., clientele building for political support); rationally and honestly deal within an established political, social, and economic structure (e.g., accountability to Congress, the President, and the public through different mechanisms); constantly improve the internal organization and technologies (e.g., measurement techniques); and develop human resources and maintain a creative social atmosphere in the workplace.

This double structure highlights the themes the public choice school shares with the intellectual tradition of *Finer* (1941) who, reflecting on *Wilson* (1887) and perceiving the political system as a certain and fixed set of principles (assumptions it shares with public choice theory), argued in the famous debate with *Friedrich* (1940) that “the servants of the public are not to decide their own course; they are to be responsible to the elected representatives of the public, and these are to determine the course of action of the public servants to the most minute degree that is technically feasible” (*Finer* 1941, 335). In the same manner, *Waldo*’s study of intellectual currents that shaped the field of public administration has common characteristics with studies that examine the impact of social and political forces on the structure of different agencies (e.g., *DiTomaso* 1994).

Of course, any single framework can hardly capture the complexity and diversity of public administration. First, human cognitive capacity is limited when describing and analyzing a field that is actively evolving. Second, many terms that are routinely used in administrative theories have multiple, context-specific meanings. For example, *Dunsire* (1973) identifies 15 meanings for the word *administration*. Third, there are other dimensions of scientific inquiry that are closely related, but not identical to, the above-mentioned dimensions (e.g., normative versus empirical research, qualitative versus quantitative research, comparative/international versus US-specific research). And finally, each dichotomous classification (e.g., politics–administration) is a crude approximation of a much subtler continuum ranging from one ideal (e.g., politics) to another ideal (e.g., administration) with real-world phenomena always containing elements of both.

For a better understanding of the different theories of public administration and the reasons why they were able to command so much attention, it is important to situate the theories in their historical context. Very often, looking beyond the immediate features of the theories allows a look into what events shaped them. For example, despite an always existing legalistic stream of thought in the United States, public administration in this country never acquired a legalistic bent (as in France) for several reasons: (1) the absence of a tradition of state in the United States

(Stillman 1991); (2) the American inclination towards universalism (Hampden-Turner and Trompenaars 1993), which in this particular situation resulted in treating public administration as generic management; (3) a limited and decentralized government. Administrative law in the United States began to emerge as a full-fledged discipline only in the twentieth century as a result of tensions between a modern administrative state and a constitutional democracy (Rosenbloom 1989). Whatever the reasons for this development, the argument is that although some of them can be analyzed through a proposed framework by distinguishing differences in theory (e.g., limited and decentralized government as a form of political structure), phenomena like the absence of a tradition of state (in the European sense) can be assessed only through historical analysis.

Therefore, it is important to discuss theories and ideas (i.e., tenets) of public administration not only from the viewpoint of their theoretical distinctiveness and rigor, but also from the viewpoint of their impact on the development of the field, the rhetoric that justified their embrace by the public, and the factors that shaped them. For this reason we find it useful to present five great ideas that shaped the field in the following framework, combining their historical importance and theoretical distinctiveness. Several ideas will be emphasized, while others will be barely mentioned. For example, subjective treatments of organizational issues (e.g., phenomenological, critical studies), although theoretically rigorous and distinctive as well as growing rapidly since the 1970s, still do not have the same impact on the field of public administration as do the schools of scientific management and human relations. Of course, overlaps are possible, but this framework is believed to be very useful in presenting ideas that have had a lasting impact upon the field.

Five great ideas (or sets of ideas) of American public administration based on epistemological and content-based criteria identified in our dual classification scheme are distinguished below. Based on the suggested link between epistemology and content, it is possible to show that theoretical concerns cast in more pragmatic terms (e.g. control vs. flexibility) were able to capture not only the attention of scholars of public administration but also the imagination of the public as well. Becoming part of public rhetoric at certain periods of history, the five great ideas shaped the field.

First, there is the idea of honest and businesslike government. It is assumed that the rules of the game and the goals of the actors are certain and stable—everyone knows what people, public officials, and politicians should strive for in this political environment. Then there is the idea of efficient administration of an organization. The tasks and roles are clear and certain again, and the system is closed—interaction with the outside world is often out of the focus. The third approach holds that political structure and goals change, and much like politicians, public agencies have to respond and adapt to change. The fourth approach is concerned with human interaction within organizations—how people reconcile multiple perspectives and interests in pursuit of organizational ends. Finally, the last idea is concerned with overall program effectiveness, recognizing limitations of the previous approaches and integrating all of the perspectives. The assumption here is that reality has multiple tenets, and each should be approached with a different focus in mind and employ various analytical tools; however, this should not be at the expense of the others. To be successful, public organizations should excel in all directions: execute functions within accepted structures and rules; adapt to emergent political structures and interests; motivate and lead employees; and strive for the most efficient use of internal resources. The five ideas that comprise this framework and that continue to serve as a foundation block for modern public administration are

1. *Honest, Non-partisan and Businesslike Government*: The idea of honest, efficient, partisan-free government administration is the single most important concept in the establishment of the field of American public administration. This stream of thought is based on two basic assumptions—that there are clear-cut, “divine laws of social order and well-being” (G. L. Prentiss 1877, as quoted in Waldo 1984, 28), and there are primarily two ultimate functions of government—“expression of will and execution of

that will” (Goodnow 1900, 22). In other words, there is an established and stable political framework that public administration should be assigned within its proper, unambiguous place. The Progressive Movement not only separated administration from politics, but by attaching the label of notoriety to virtually everything political, it also started the relentless drive of looking to the private sector for best practices. It ignored legalistic management as too bookish, and public administration did not develop within a legal framework. One reason for this ignorance was angst against bookishness, and another reason was case law that differs from continental European (France’s) codes of law. As today’s calls for privatization and more market structure in the provision of public services show, this drive to borrow from the private sector is not limited to internal organizational processes, but it relates to political and economic structures as well. Interestingly enough, analysis of public administration theories from this perspective (based on objectivity and external focus) brings Wilson’s theory of public administration and public choice theory under the same conceptual umbrella, however strange it may seem.

2. *Classic Management Models*: After administration was legitimately accepted as separate from politics and functionally identical to business, the dominant ideal became machinelike efficiency in getting the job done with a minimum of wasted energy. The focus shifted from the political question of the place of public administration in society to a more micro-concern—effective management of an organization premised upon the idea of clearly recognizable, scientific laws describing reality. This direction drew heavily from the scientific management school and reached a peak in the more sophisticated analyses of administrative decision-making. Studies of the business organization gave rise to a number of supposedly universal laws or principles of administration and to a procedure, scientific management, by which optimum efficiency could be achieved. It was no more than logical to borrow these discoveries for application to the management of public sector organizations; as such, management was defined within the closed model.
3. *Politics and Policy Making*: After the field of public administration was already established and the emergent welfare state began its extensive programs, it became evident that the dichotomy between politics and administration was no longer realistic. As government intervention became common and as interest-group liberalism took hold, it became obvious that public agencies were reaching to different constituencies, influencing them, and adapting to their needs. This meant change in one of the assumptions upon which the field had been founded—clear, fixed laws of democratic structure where every institution is assigned its specific and exclusive role. It was recognized that there is no set role for public administration in a democratic political system; rather, public administration reflects changes in the society and simultaneously shapes them. Thus, a major trend in public administration has been the movement away from the idea of neutrality and toward the idea of politics. Although early advocates of administrative neutrality argued that administrators merely implement public policies, that assumption now was seen as naive. It was recognized that values intrude on administration from many external sources and are also present in even supposedly objective internal decisions as to policy implementation. Also recognized was the idea that bureaucrats are necessarily policymakers as much as any other participants in the process.
4. *Human Behavior*: The classical school of management had its roots in Taylor’s scientific management school and an engineering conception of efficiency: getting the job done with a minimum of wasted energy. Although management theories primarily derived from the private sector did provide an understanding of the organizational skeleton, they proved to be inadequate for explaining behavior in public or private

organizations. In particular, they failed to account for the complexity of human nature or for the impact of an uncertain and changing environment. Following the much publicized Hawthorne (i.e., Western Electric) experiments in the late 1920s and 1930s as well as introduction of a sociological approach to organizations (organizations as social systems), a new school of management thought was formed. The behavioral model emphasizes the importance of human relations and personal goals. If the closed model concentrates primarily on a technical system of organization—a system that produces products or services or that maintains operations—then the behavioral model recognizes the equal importance of the social system that is comprised of uninstitutionalized, multidimensional, and nebulous networks of relationships between individuals or groups within an organization. While preserving the focus on intra-organizational management, this school focused on multiple meanings and uncertainties that people have in coping with any human organization.

5. *Program Effectiveness*: As a result of government programs' growth with new missions, combined with the rapid technological and demographic changes experienced since the turn of the twentieth century, and the shrinking of public resources (in constant dollars), the effectiveness or productivity of public organizations has become a primary concern of the American public. Notions of the one best way of administration have been criticized, and more inclusive approaches to administration have been advocated. This is true not only of practical tools and techniques, but also of a theoretical understanding of the field. By and large, public administration began to view itself as a synthetic field that has to balance competing, and often contradicting, values and that is open to continuous adaptation and improvement in pursuit of productive performance.

II. IDEA ONE: HONEST, NEUTRAL, BUSINESSLIKE GOVERNMENT

One of the continuing tug-of-wars in American public administration has been credentials (which imply competence) versus representativeness (which implies responsiveness). Even in the relatively small bureaucracies presided over by presidents from George Washington to John Quincy Adams, qualifications were highly valued. Although there certainly existed political patronage, such patronage was not elevated to the level of political philosophy. George Washington claimed that government jobs should be given to “those who seem to have the greatest fitness for public office” (Tolchin and Tolchin 1971, 323). But in 1828, the influx of previously disenfranchised, propertyless masses into politics through the elevation of Andrew Jackson to the Presidency initiated a new administrative philosophy—spoils. As opposed to government by the elite, that system emphasized rotation in office as a means to achieving politically responsive administration. Almost any citizen was considered fit to carry out the simple duties of public management, which were, after all, just a matter of common sense. In his first annual message to Congress in 1829, Jackson declared, “The duties of all public offices are ... so plain and simple that men of intelligence may readily qualify themselves for their performance; and I cannot but believe that more is lost by the long continuance of men in office than is generally to be gained by their experience. They are apt to acquire a habit of looking with indifference upon the public interest” (Hofstadter 1954, 51).

Unfortunately, the price of responsiveness was high. Although the offering of gifts as corrupting bribes is a practice that dates back to the establishment of the first ancient public organizations, it was particularly rampant under Jackson's spoils system. During much of the nineteenth century, at all levels of government, graft was widespread; scandals were frequent. It was not unusual for a public official to receive very large sums for reasons of influence, not friendship. Such behavior is still not unusual in many developing societies. But corruption had high indirect costs. Inefficiency became endemic; graft widespread; scandals frequent—not only at

the federal level but also at the state and municipal levels where the spoils system prevailed. A large, increasingly industrialized and more complex nation could not tolerate such poor public service administration just as government was taking on new responsibilities. Municipalities had to deliver water, assure public safety, maintain smooth streets, fight fires, and, by the end of the century, provide public education and regulate private utilities or mass transit systems.

Waste and dishonesty had to be curbed if government and a growing society were to function efficiently. In the post-Civil War period, reform movements appealed directly to the public for efficiency and honesty in both politics and administration. A common theme of reform emerged in the 1870s and dominated politics for half a century. Known as the Progressive Era, reforms would bring about significant changes in the administrative functions of government. Between 1875 and 1920, economic progress and turbulence changed the context of politics, stirring citizens to replace the corrupt machines and install administrators who would improve the cities' atmosphere for commerce and the quality of life. Old machine politics and the spoils system were blamed for every ill in society—inefficiency, injustice, corruption, and prostitution (Kaufman 1965, 129). Attacking the spoils system, reformers did succeed in defining *conflict of interest* as an immoral situation. It is now common to find such constraints on officials since the prohibition against having a financial interest in any company that their agency regulates or has commercial dealings with. Similar situations that are considered ethical within the letter of the law are increasingly coming into question on moral grounds.

The reaction—the first great theoretical foundation stone of American public administration—was a reform movement that appealed for efficiency and honesty in government. The Pendleton Civil Service Act of 1883 created a neutral, bipartisan Civil Service Commission—the beginning of the system that now covers more than 90% of public employees. The establishment of a civil service system amid a prevailing atmosphere of reform provided both the means and the impetus for getting the job done with a minimum of wasted effort.

As a function of the reform movement, jurisdictions within the United States began to establish codes of ethics, which were written into law; today, those laws typically require that public services should be provided honestly, openly, fairly, and without discrimination. In short, citizens expect bureaucrats to act within the law, not as a law unto themselves. Although compliance with the law is often cumbersome, members of a society are willing to accept some inefficiency as the price of freedom. They recognize that one of the basic strengths of democracy is concern with the means as much as with the ends of government. To the public and the press, however, the rules and regulations that result from the necessity to administer laws equitably are merely manifested as the frustrating red tape they so often deride.

The clear separation between politics and administration was demanded by reformers such as Woodrow Wilson (1887) (in his role as professor), who suggested a dichotomy between (1) policy determination via politics and (2) policy implementation via nonpolitical administration.* Implementation of public policy in government would, according to Wilson, follow principles of more businesslike management. To do so, those managing governments needed to devote greater attention to the science of administering government (i.e., administrative principles and sound management). According to Wilson, “Organization and methods of government should determine first, what government can properly and successfully do, and secondly, how it can do these things with the utmost efficiency... America needs to develop an administrative organization and skills for proper administration” (Wilson 1887). Only through competent, uncorrupted administration would government carry out the people's wishes and those of their representatives. Public servants would be perceived as professionals, administration as efficient, and government as trustworthy. This reflected a second distinctive feature of the movement—belief in a science of administration

* For Wilson's role in formation of public administration in the United States, see Cook (1995), Stillman (1973), and Van Riper (1984).

(or the one best way of doing things), in addition to a belief in expertise, which nonpolitical public servants were to represent.

Later Frank Goodnow (1900, 22) reinforced Wilson's points, interpreting the Constitution as a statement of "two distinct functions of government." Policy was centered in the legislative and judicial branches, and it was to be administered only by the executive. Policy was an expression of state will, depoliticized administration the execution of that will. The thrust of the turn-of-the-century reform movement was captured in the saying: There is neither a Democratic nor a Republican way to build a road, just the right way. Thus the Reform Movement was evolving in two main directions: (1) neutrality of personnel and (2) improvement of efficiency, mostly on a local level.

In 1894, the First Annual Conference for Good City Government organized the National Municipal League as a forum and coordinating body with the objective of formulating a plan that could be supported nationally (Shafritz and Hyde 1991). Two hundred affiliated societies developed a theory of good government that rested on four fundamental elements and associated reforms that held:

- The efficient delivery of public services is central to the public interest.
- Administration of public services must be separated from politics and would operate through independently elected boards and commissions.
- Experts with specialized training, appointed under a civil service merit system, would comprise a permanent civil service and could implement scientific methods.
- Government would be operated as a business by applying principles of scientific management, including proper budgeting and accounting procedures and competitive bidding.

By the turn of the century, the Reform Movement had achieved significant changes in the practice of public administration, particularly in the areas of fiscal and personnel management. Galveston, Texas, for example, became the first city to be run on the business model, and this model was subsequently adopted by more than 450 municipalities prior to World War I (ICMA 1994). The city manager model was implemented in the first decade of the century in several municipalities. With the advance of reforms, the rhetoric of reform also began to change. If personnel reform was seen by many in the 1880s as a high moral endeavor, by the beginning of the century, it was mostly seen as a more pragmatic "matter of improving the quality of administration" (Waldo 1984, 29).

In the century intervening since Wilson's call for more businesslike public administration, the public sector has certainly adopted many private sector techniques. Nevertheless, such improvements in public administration have had one ultimate objective—improved productivity. However, public service has lost much of the public's confidence. Despite a century of systematic efforts to improve the delivery of government services and despite great progress, the public is frustrated and angry, and it continues to demand that government personnel be smarter and work harder. The lack of confidence evident in the latter third of the nineteenth century has not dissipated. In 1926, Leonard D. White (1979), a noted analyst of American government, observed that

Two ideas are widely held by the American taxpayer. He believes that there is an extraordinary number of useless or overpaid public officials and he is convinced that most government employees are lazy and incompetent. . . . The city, state, or federal employee. . . thinks of the years of faithful service which he has performed, well hidden from the windows where "the public" peers in. . . and is not unlikely to shrug his shoulders, thinking, "What's the use."

And almost six decades later, Kaufman (1981) concluded that public administration had not made any headway with the populace.

Over the course of more than a century, the idea of honest, neutral, businesslike government did not die in public administration studies or in popular rhetoric. Although many concepts preoccupied generations of scholars, such as the more responsive and just, value-driven perspective of the New Public Administration in the 1970s (Frederickson 1971; Marini 1971), the idea of situating public administration within an objective, clear notion of governance did not vanish. A major intellectual development in the field of public administration in the early 1970s was the emergence of the public choice School of thought. The methodological emphasis of public choice theory is on more or less objective and stable knowledge from which to draw and a preoccupation as to the place of public administration in constitutional government. Drawing from the public choice school in economics, Ostrom (1989b, 16) argues for a new concept in American public administration that is based on the theory of public goods rather than the theory of bureaucracy with which, he suggested, American public administration was preoccupied. The public choice school can be best characterized by its proposed foci of study (Ostrom 1989a, 876): “multiple levels, facets, and foci of analysis that relate to: (1) human valuation, (2) production possibilities, (3) arrays of goods and services, (4) rule-oriented relationships, and (5) shared levels of common understanding that enable people to communicate, and act meaningfully, to one another.” As Vincent Ostrom (1977, 1510) explains, “the subject matter of political inquiry is the allocation, exercise and control of decision-making capabilities among people in human societies. Decisions are ordered by reference to rules.” This attention to rules squarely stands in the tradition of public choice. After Arrow (1951) demonstrated that in a rational-voting collective system it is possible not to achieve a collective choice that is consistent with diverse preferences of the individuals comprising the collective, the process of inquiry focused on making the process fair. Buchanan and Tullock (1962) shifted the analysis to the rules of the game instead of the outcome because some inevitably would win and others would lose, as Arrow demonstrated. This type of analysis has paid attention to the rules of aggregation of preferences in the society. Elinor Ostrom (1991) took the analysis of this mode farther, drawing on game-theoretical traditions, and identified a minimal set of rules that are important to governance of democratic societies, which includes information rules, boundary rules, scope rules, authority rules, and aggregation rules. As for every major intellectual achievement, it is difficult to put the work of Vincent and Elinor Ostrom and other representatives of the public choice school into procrustean cells of classification schemes. Based on tenets of public choice theory such as multiple arrangements of service provision, the importance of voting for service delivery and flexibility in its approach, many may see the public choice school as closer to the political adaptation category. This may have been the approach if the classification followed the flexibility–control nexus instead of the subjectivity–objectivity nexus. But, as mentioned above, these classifications do not translate into each other directly. In this case, the classification on the objective nature of knowledge is based in public choice theory. The importance of the public choice school also rests on the fact that, on a theoretical level, it reintroduced and facilitated the idea of multiple arrangements for provision of public goods, including, among others, privatization. These ideas have become so strong a political theme that the field of public administration has been forced to accede to an almost irrational rush to privatization. The enduring nature of the privatization movement remains in question, however, to the extent that the unanticipated, and often negative, consequences of so fundamental a shift in service provision become evident.

The ideas of neutrality, competence, and businesslike behavior have their manifestations and critics in contemporary terms. The citizens’ distrust toward government, lamented by White (1979) and Kaufman (1981), has not been alleviated. Instead, it has worsened. Since the 1950s, there has been an increase in distrust of the government (Kass and Newton 1995; Nye et al. 1997) and a decline in voter turnout because of an increasing sense of alienation by the people. The increase in distrust has been used by many politicians to promote an anti-government or a smaller government agenda. Whatever the reasons for the distrust, government faces more and more pressure in terms of its performance and accountability. As Gulick (1990, 602) assesses: “the turn of the century to the

twenty-first century needs much of the same reforming energy that the turn of the century to the twentieth generated.”

Businesslike government is prescribed in the reform programs guided by the New Public Management philosophy. One aspect of the idea, borrowing management practices from the private sector, has been evident for the past two decades. For example, strategic planning, especially the Harvard Business School model, has been widely adopted in public agencies. Performance measurement techniques have been implemented widely too. Of particular interest now is the balanced-scorecard model made popular in the private sector. The general idea of re-inventing government originated in the business process re-engineering model that became popular in the late 1980s. The new fanfare of e-commerce has spilled into government operations, which IT managers are called upon to develop e-government.

The privatization and out-sourcing practice and theory can be related to this idea of businesslike government from a seemingly shared assumption: business organizations are better managed with higher level of efficiency, economy, and effectiveness. The difference with government is that privatization advocates go much farther than the Progressive reformers: because business organizations presumably generate greater efficiency, let them do the job and shrink the government. The idea of businesslike government remains active; however, coupled with the current political environment and ideologies, its practical meaning has changed from reforming government to make it work to shrink government. Progressive reformers at the beginning of the twentieth century valued efficiency, but they placed efficiency under a democratic framework supporting active citizenship. As Sayre (1958, 103) explains, “The responsibility of administrative agencies to popular control was a value taken-for-granted.” White (1926, 419) acknowledges that means must be found to “ensure that the acts of administrative officers shall be consistent not only with the law but equally with the purposes and temper of the mass of citizens.” It is clear for Willoughby that “efficient bureaucracy was a solution to the manifold problems of democratic governance” (Lynn 2001, 149). The contemporary re-inventors, however, tend to achieve efficiency at the price of democratic accountability and governance.

The endurance of the old idea and the change of its practical meaning also apply to other aspects of businesslike neutral government: expertise and competence. These aspects may be more important than being businesslike because, as Gulick (1990, 600) says, “the drive for specialization and professionalization of management came first from the municipal reform and reform forces, well before schools of management were initiated for private business.” The call for more professional expertise has never been abated in the United States, but the dominance of expertise has also been increasingly criticized for ignoring citizens and their local knowledge. On the one hand, Dewey’s observation in the 1920s that the public’s problem is the dilemma between the increasing complexity of the society and the limitation of human beings is still sound today. The government needs more qualified professionals to solve complex changing problems. On the other hand, since the 1920s, government policies have increasingly been formulated by a network of policy elites, researchers, and administrators with the advent of a technocracy dominated by a world view in favor of positivistic, objective knowledge over local, subjective understanding (Fischer 1995). The unexpected consequence is that average citizens are left out in the administrative decision process because of a lack of professional knowledge (Hummel and Stivers 1998; Zanetti 1998).

Another major tenet associated with this first idea, the politics-administrative dichotomy, is also still alive. Although vehemently attacked by the advocates of a political theory of public administration as illustrated later in the third idea, it has been reinterpreted as a professional standard (Rosenbloom 1993), an institutional ban on particularism (Montjoy and Watson 1995), an ideological doctrine (Lee 1995), a structural tension (Skok 1995), a complementarity (Svara 2001), and an ideal type (Rutgers 2001). In practice, politics and administration are still considered as separate ways of thinking and decision-making (Klingner et al. 2002), which differentiates non-career and career executives (Dolan 2000). In management capacity studies, Ingraham and Donahue (2000, 294) differentiate administrative functions and policy implementation, a move

appearing to revive the politics–administration dichotomy. Although they argue that their intention is not to revive the dichotomy, their statement testifies to the dichotomy’s analytical relevance: “the staff functions and program-policy functions also have independent effects on government performance, and thus should be distinguished to develop a richer understanding of government management.”

More efforts have been made to probe early writers such as Wilson and Goodnow’s meaning of the dichotomy with the assumption that they have been misinterpreted or distorted by their followers and critics. Lynn (2001) makes a significant contribution in arguing that traditional thought shows great respect for law, politics, citizens, and values. For example, Goodnow is often considered as a proponent of a stark dichotomy of politics and administration, but, as interpreted by Merriam (1926, 142), Goodnow “drew a line between political officials, who are properly elective and the administrative officials, who are properly appointive. ‘Politics’ should supervise and control ‘administration,’ but should not extend this control farther than is necessary for the main purpose.” This idea is summarized by Van Riper (1983): “As we all know by now, politics and administration are inextricably intermixed. Both are central to effective action. One problem is to bring them together in a symbiotic association yet keep each in its proper place. The other is to understand that the ‘proper place’ of each will vary through time. There is no permanent solution, no fixed paradigm, to this or any other ends–means continuum.”

To many contemporary writers, the rereading of this first idea and its historical context is of great relevance. For example, the New York Bureau of Municipal Research was traditionally viewed as a major implementer of scientific management principles in government. A re-examination shows that what the center stands for is professionalization and informed citizenship (Schachter 1997; Stivers 2000). A study traces to the center the use of performance measurement techniques to improve government responsiveness and democratic governance (Williams 2003). These studies do not nullify the importance of the first great idea; on the contrary, they make it currently more useful by demonstrating its context and by balancing efficiency and neutrality with democratic values such as accountability and citizenship.

III. IDEA TWO: CLASSIC MANAGEMENT MODELS

The establishment of a civil service system amid a prevailing atmosphere of reform provided both the means and the impetus for more businesslike government. Following Wilson and other reformers who suggested that the running of government needed to be made more businesslike, the dominant ideal became machinelike efficiency in getting the job done with a minimum of wasted energy. Although the business sector was often pointed to by government’s critics as a model of efficiency, neither businesslike management nor common sense was an adequate guide in these complex matters. The business model (whether applied by public or private organizations) still came up short; the right way to run an organization was simply neither self-evident nor intuitive. Honest common sense proved inadequate as an efficient, productive guide to managing complicated systems in complex organizations. Paradigms were needed.

Studies of the business organization had given rise to a number of universal laws or principles of administration and to a procedure—scientific management—by which optimum efficiency could be achieved. It was only logical to borrow these discoveries for application to the management of public sector organizations, and such management was defined within the closed model. Or, as Willoughby (1927) writes, “. . . in administration, there are certain fundamental principles of general application analogous to those characterizing any science which must be observed if the end of administration, efficiency in operation, is to be secured.” Urwick (1937, 49) concurs:

There are principles which can be arrived at inductively from the study of human experience of organization, which should govern arrangements for human association of any kind. These principles

can be studied as a technical question, irrespective of the purpose of it, or any constitutional, political or social theory underlying its creation.

Generic principles of organization were considered applicable to the management of public sector organizations within the closed model (administrative, bureaucratic, mechanistic) that describes organizations where organizational interests dominate the individual's interests. These organizations' interests are concentrated on efficiency and effectiveness as well as specialization and obedience to authority. The closed model of organizations is described by such terms as bureaucracy, hierarchy, pyramid, or vertical, formal, rational, and mechanistic.

Under the scientific management rubric, the works of Taylor (1903, 1911, 1923) and his followers demonstrated the efficiencies of having management study, identify, and teach workers the one best way to perform each task. However, these management theories proved to be inadequate for explaining organizations. They failed to account for the complexity of human nature or for the impact of an uncertain and changing environment. But if they omitted the muscle and the flesh, they did provide an understanding of the skeleton: organizations are made up of certain parts and processes that have to be managed. Taylor assumed that a manager's job is a result of the division of labor, and it is a separate full-time job to manage. Thus, Taylor's theoretical framework included the notion that management has: (1) the responsibilities for discovering the best ways to plan and perform all aspects of operations and (2) is charged with selecting, training, developing, and monitoring each individual in the establishment [organization] to enable that worker to do the highest class of work to the limit of his natural abilities.

Although his principles were resisted by organized labor within government, Taylor's work helped to set a model for government by defining the formal model of organization as a rational, legitimate, institutionalized relationship of people formally managed or coordinated from one center to accomplish certain common predetermined goals, objectives, or purposes.

According to Fayol (1949) and others, working in an industrial context, basic elements of formal or administrative organization are specialization, authority, hierarchy, division of labor, communication, standard procedures of operations, and management. The combination of these elements, and the relationships between them, defines the organizational structure.

Within the public sector, the types of organizations that Taylor and Fayol helped to define, in industrial terms, fit within the bureaucratic model defined by German sociologist and political scientist Max Weber. The basic prototype of such a model was described by Weber as an "ideal-type" bureaucracy (1958). Weber's ideal type, or model of bureaucracy, describes an arrangement of positions that he considered to be the "most rational known means" of accomplishing objectives. According to Weber, the bureaucratic form routinizes the process of administration exactly as the machine routinizes production. Efficiency is achieved through the creation of a fixed division of tasks, a well-defined hierarchy of authority, impersonality, and detailed rules and regulations. Weber viewed bureaucracy as based on a more progressive type of authority than did previous historical formations. As opposed to kings who held traditional power and extraordinary leaders who wielded charismatic power, bureaucracy was based on legal-rational authority. This approach made it both more vital and more efficient although the popular understanding of *bureaucracy* is associated with no response, red tape, and inefficiency.

The chief characteristics of the Weber model include universal rules impersonally carried out, use of written records, division of duties into spheres of competence, training for each position, selection on the basis of competence, hierarchical arrangement of offices, salary based on position, and tenure of office. These characteristics make for an enduring, predictable, efficient, organized machine. In a well-run bureaucracy, of which the best military divisions and agencies are the most appropriate examples, operations are managed in a way that the best compliment is like clockwork. It is often the most efficient model in terms of logic, cost, speed, control, and operational stability. Basic features of this model include politically predetermined and clearly stated goals, centralized authority, a strict chain of command, and a prescribed set of impersonal and interconnected

regulations for all aspects of the organization's activities (management's and employees' rights and duties, punishments and benefits, operating and managerial procedures, etc.). The core element of the structure of every public bureaucracy is strict hierarchy with a single chief executive on the top. Each position is under the direct administrative control of the supervisor one level above. Functions, rights, and duties are assigned to the positions, not to persons. Each member of the organization has limited and clearly defined rights, duties, powers, and expertise fixed in written instructions. Vacancies are filled and promotions are accomplished because of formal technical qualifications (certificates, degrees), seniority, or achievement.

Whereas Taylor (an American) emphasized more of an engineering understanding of efficiency—performing a particular job in one best, scientific way as to produce maximum output from each worker—Fayol (a Frenchman) and Weber (a German) placed more emphasis on coordination and control as to produce maximum output from an organization. It is often argued that this difference was a result of different American and European experiences (Hofstede 1993).

Building on the type of work and principles that Taylor, Fayol, and others developed in the industrial context, Gulick and Urwick (1937) identified a set of processes that take place in every organization. They used the acronym POSDCORB (Planning, Organizing, Staffing, Directing, Controlling, Reporting, and Budgeting). Each of these processes was linked to rules for their healthy conduct. For example, Gulick and Urwick identified and advanced the concept of specialization so to better utilize the varying skills and aptitudes of different workers. With the advance of specialization, they also recognized a heightened need for coordination of work. Coordination was to be achieved by (1) a structure of hierarchical authority and (2) the development of a singleness of purpose in the minds and wills of those who are working together. Organizations should always adhere to the (scalar) principle of a chain of command with unity of command. Urwick's (1952) Ten Principles describe guidelines for organizational design that should be used in building up any formal organization:

1. *Principle of the Objective*: Every organization and every part of every organization must be an expression of the purpose of the undertaking concerned, or it is meaningless and redundant. Organization cannot be found in a vacuum; it must be for something.
2. *Principle of Specialization*: The activities of every member of any organized group should be confined, as far as possible, to the performance of a single function.
3. *Principle of Coordination*: The purpose of organizing, as distinguished from the purpose of the undertaking, is to facilitate coordination or unity of effort.
4. *Principle of Authority*: In every organized group, the supreme authority must rest somewhere. There should be a clear line of authority from supreme authority to every individual in the group.
5. *Principle of Responsibility*: The responsibility of the superior for the acts of his subordinate is absolute.
6. *Principle of Definition*: The function of each position, the duties involved, the authority and the responsibility contemplated, and the relationships with other positions should be clearly defined in writing and published to all that are concerned.
7. *Principle of Correspondence*: In every position, the responsibility and the authority should correspond.
8. *The Span of Control*: No person should supervise more than six direct subordinates whose work interlocks.
9. *Principle of Balance*: It is essential that the various units of an organization should be kept in balance.
10. *Principle of Continuity*: Reorganization is a continuous process; in every undertaking, specific provision should be made for it.

In 1937, President Roosevelt charged the Brownlow Committee with seeing that American democracy can efficiently do the job required of it. The Brownlow Report (Brownlow Committee 1937), under Gulick's direction, represents the high point of an impetus for scientific management in government. As opposed to the *Papers on the Science of Administration* (1937) that did not elaborate on political assumptions and the implications of generic administrative science (Golembiewski 1989), the Brownlow Report was more forthcoming on this issue. According to Rohr (1986) it "attempts to ground scientific management in constitutional theory and fundamental principles of American government."

To the field's credit, principles of management were not naively accepted as universal absolutes. Simon (1946) challenged the concept of principles in administration, likening them to proverbs. He identified contradictions, and he suggested that these so-called principles should be treated as possible prescriptions, depending on a situation. In his landmark study, Simon (1997 [1947]) reoriented inquiry in the field of public administration, and organizational science in general, to decision-making. Drawing from the philosophy of logical positivism, Simon distinguished between values and facts, and he identified a value-fact chain as a knowledge basis for different levels of the organization where the means for a higher level could be interpreted as ends for the lower levels. This leads to rational decision-making based on limited, but more or less unambiguous, knowledge. Rationality is not comprehensive, but bounded—by both human cognitive abilities and costs related to acquiring that knowledge. Analyzing the decision-making process, Simon showed that human decisions are not based on the principle of maximizing results; it would be too ambitious and costly a task. Rather, people "satisfice" (a term coined by Simon from *satisfy* and *suffice*). Simon's and his colleagues' work (e.g., March and Simon 1958; Simon et al. 1950) is considered to be the peak of the classic school, or as it is often branded, constitutes the neoclassical school in management.

Classic management models set the basis for many modern management techniques such as management by objectives (MBO), and planning, programming, budgeting systems (PPBS). But they have also been criticized for underplaying the human aspects and the uncertain environments of an organization, for resulting in mindless bureaucracy and dehumanizing human beings, and for endorsing monopoly over knowledge to control execution. A contingency view considers, at best, that the models work well only in situations with a stable environment, easy tasks, standard production, and where precision and efficiency are at a premium.

To some extent, the limitations of the classic models are the limitations of modernity and rationality. The mechanization of life and bureaucratization of organization was, and still is, a broad social trend or underlying social force. Modernity and rationality cannot be escaped for the time being, and the classic models cannot be thrown away. One simple fact is the terminologies used in the models are still the basis for communication on managing and organizing. Some researchers have attempted to recover a certain ethical dignity for bureaucracies, countering romantic critiques from radical humanists and the ahistorical allegations from new managerialists (e.g., Du Gay 2000). In organizational research, Scott (1996) shows that Weber's legacy and mandate is still being honored in the field. Sharp and Housel (2004) validate Fayol and Gulick's approach with a case study on the Oklahoma Health Department. Taylor, for example, has been depicted as authoritarian and reductionistic, equating employees with economic man and motivation with pay incentives. But his theory is still relevant, far beyond the football field, gymnasium, and McDonald's (e.g., Morgan 1997). Taylor had many supporters in the early twentieth century and has many modern defenders (Drucker 1976; Fry 1976; Hodgetts and Greenwood 1995; Martin 1995). Drucker (1976) welcomes a rediscovery of scientific management, arguing that Taylor's motivational strategies provided the worker with an opportunity for full personality development. Hodgetts and Greenwood (1995) find that Taylor's principles of scientific management are alive, well, and ready for the twenty-first century, and organizations adopting total quality management (TQM) practices are employing concepts espoused by Taylor. Their latter point is also confirmed by Martin (1995) who sees much continuity between scientific management

and modern TQM in terms of fundamental issues (meeting the needs of external and internal customers) and methods of decision-making (group research and continuous improvement) and implementation.

In public administration, Schachter (1989) shows that the loss of autonomy in a working place, a common critique on Taylorism, occurred before Taylor was born; Taylor was not oblivious to social relations, but he had an innate concern with improving worker participation. Schachter identifies a prewar appreciation of Taylor in local reformers assuming that “adapting his methodologies to city bureaucracies can increase their responsiveness and accountability” (111). The denigration of Taylor is partly caused by misinterpretation that “focuses on a narrow range of quotations or confuses his own ideas with their purported application by people he specifically repudiated” (Schachter 1989, 1). This misinterpretation manifests the field’s weakness of theorizing, writing, and teaching.

Another powerful defense of scientific management comes from a publication by Van Riper (1995) who presents Gulick’s only known speech (in 1931) on the place of scientific management in public administration. In this speech, Gulick admits that it is more difficult to apply scientific management in government than it is in industry because of politics’ presence, the democracy controlled by the many, the complex environment, the home rule in local affairs, and the teleological enigma of government. But Gulick goes on to defend scientific management: “It is because of all these difficulties that scientific management in public affairs is of supreme necessity. The very fact that government enterprises are larger in manpower and more complex in function than private industries makes scientific management the more essential” (in Van Riper 1995, 7). In a similar vein, Weber’s conception of administrators as neutral servants to political masters is reviewed to examine its relevance for American public administration (Fry and Nigro 1996).

IV. IDEA THREE: POLITICS AND POLICY MAKING

Idea One underscored competence emphasized competence that was premised on neutrality, and Idea Two that was on efficiency. Inflexible adherence to assumptions of neutrality, businesslike management, and the one best way, however, leaves little room for compromise between the competing values that characterize the environment public agencies work in. Contemporary public administration must stress the interaction of political values and administration: the exercise of administrative discretion in interpreting policy directives, the need to decide between countervailing values and interests, and the relation between external and administrative advocates of policies. Idea Three critiques each aspect of the policy process: the need to decide, the need for information and the role of the expert, and the rational and incremental decision styles.

As opposed to the relatively naive assumptions of nineteenth century reformers, twentieth century analysts accept the reality that major appointed administrative officials often take the lead in making policy, and officials at lower levels must be involved in interpreting policies. Policies in the nineteenth century were predominantly distributive—in the framework of limited government—and did not require as much interpretation as regulatory and redistributive policies that became prevalent with the welfare state.* With the advent of Depression-era big government, with the blossoming of New Deal programs, public administration has recognized that the assumed dichotomy between politics and administration is not realistic. A major trend has been the movement away from the preoccupation with neutrality and toward realization of the politics aspect of administration. Although early advocates of administrative neutrality argued that administrators merely implement public policies, that assumption now seems naive. The idea that values intrude on administration from many external sources and are also present in supposedly objective internal

* For typology of public policies, see Lowi and Ginsberg (1992).

decisions as to policy implementation is now recognized. Bureaucrats are policymakers as much as other participants in the process. A more realistic concept is public administration equals politics plus management.

Although there were always voices against the naiveté of viewing public administrators as neutral, the frontal assault on the subject began in earnest in the 1940s, gathering momentum by the end of World War II. Appleby (1949, 43) argued that “arguments about the application of policy are essentially arguments about policy.” Waldo (1984) found studies of public administration to be grounded in political theory. Long (1949) argued that “the lifeblood of administration is power,” and called everyone’s attention to such aspects of administrative agencies as political survival and cultivating of clientele. Selznick (1949) showed how the Tennessee Valley Authority (TVA), an independent public agency, was able to survive and achieve its mission by adapting to local interests. Simon (1997) showed that every decision is based not only on facts derived from administrative realities, but also on values. Elaborating on this later, Simon (1967) declared Wilson’s postulate “the field of administration is field of business. It is removed from the hurry and strife of politics” simply wrong not only in the present, but also in the past. Simon insisted that Wilson’s postulate is rather normative than descriptive, and it should be understood as “the field of administration *ought to be* a field of business.” Simon proposed to discuss the issues of power of a bureaucratic office not in terms of neutrality, but in terms of autonomy, predictability, and reliability. Simon proposed that when neutrality is discussed, the predictability of the values that will be achieved by impartial actions of the bureaucracy must be taken into account. As long as values are not questioned, neutrality can be insisted. But when values change, it cannot be ensured that the neutral routine of the bureaucracy is taking society to predictable, reliable, and societal values it endorses.

In 1957, Glendon Schubert (1957), butchered the idea of public interest, showing that each approach to public interest that ought to guide neutral public servants in their activities had underlying political philosophy (implications).

There are many theories prescribing different roles to administrators (bureaucrats) in a system of governance (Hill 1991). Some argue that bureaucracy is an instrument (e.g., a tool of economic elites in Marxist interpretation), some argue that it is a major player in a policy process (e.g., in Dahl’s and Lindblom’s (1953) “polyarchy”), and some see it as a predominant actor (e.g., the bureaucratic politics model of Allison (1971)). Particularly popular is the literature on policy subsystems.

The most common image of the subsystem is that of an iron (or cozy) triangle where the interest groups, congressional committees, or subcommittees and the executive branch agencies decide policies in a closed consensual manner. But this is only one conceptualization—the simplest form of policy subsystems. Such subsystems range from (1) closed entities that are termed iron triangles* to (2) the still structured, but more open and knowledge-based, advocacy coalition framework of Sabatier (1988) to (3) the even looser structured policy issue networks of Hecló (1978) “where it is almost impossible to say where a network leaves off and its environment begins,” to (4) the garbage can model of Kingdon (1984) where public policy agendas are formed by random coupling of solutions, problems, and participants (with their resources) in a period when choice opportunities occur. The portrayal of loose structures of policy processes, such as Kingdon’s model, are often criticized on the basis that they disregard the institutional basis of politics because “institutions are more than simple mirrors of social forces” and that “political institutions define the framework within which politics takes place” (March and Olsen 1989, 18). The argument is often made that policy subsystems differ across policy types (Ripley and Franklin 1991). An important aspect of policy subsystems models more complete than the iron triangle is their closer attention to

* The term has been used since 1964 by Douglas Cater (1964), but it gained prominence in the 1970s by Gordon Adams’ (1982) study of defense contractors.

knowledge and argumentation, and they are based on more sophisticated models of decision-making than rationalistic and incrementalist approaches.

For considerations of space and simplicity of the argument, focus will be on a more balanced view of the politics school, arguing that in a political system where many groups have a voice (pluralism), bureaucrats with substantial expertise play key roles. Indeed, legislation is written as often by bureaucrats as by legislators. The bureaucracy is as capable as any other participant in the political process of mobilizing support for its interests, and it is as likely as any to become part of a policy-making coalition. Laws are administratively interpreted in their execution. Written in only a few pages, they must be interpreted in many, often unanticipated, specific situations. Therefore, as the final step in the policy-making process, administration is the last chance to influence policy, which is the ultimate focal point of the process. Administrative discretion, then, is a fact necessitated, rather than precluded, by the law.

It follows that administrative agencies are the objects of outside pressures, often by interest groups and legislators, because administrative initiative in drafting policy and administrative discretion in interpreting policy inherently include value preferences, and even so-called technical decisions are actually value laden.

After a policy is formulated, its implementation is far from assured. Interest pressure fields are also to be found inside public organizations. Rourke (1984) argues that administrators should play active roles in policy development and implementation; because of their powers of discretion—creating favorable attitudes among the public, organizing clientele, and cultivating goodwill with legislatures—agencies become the objects of policy preferences from external sources—interest groups, legislators, the media, individuals. Within an agency, officials become advocates for the external pressures that the organization is subjected to—arguing for or against certain positions and interpretations, for or against strict standards, advocating or disparaging the necessity for tighter controls. Having won policy victories in the legislatures and the courts, representatives of those groups have shifted their efforts and tactics to the less glamorous bureaucracy to achieve effective policy implementation. External groups are increasingly sophisticated enough to appreciate the need for political support—the need to mobilize external forces for supposed internal decisions. Of course, some groups may work to weaken implementation; after an initial decision to tighten standards, an industry may place direct pressure on the bureaucracy to reverse or weaken the decision. And, within the bureaucracy, top-level officials may reflect those arguments.

The budget is a particularly important policy arena. It is one where the roles and skills of administrators are critically important. Every government, city, county, state, and national, operates under an authorized spending plan—a budget. Because budget documents are massive tomes filled with figures, they are commonly thought to be dry, dull, and unexciting. But nothing could be farther from the truth. Money is the lifeblood of an agency or a program; its budget will determine how many people will work and what facilities will be available to them. The struggle for such allocations is a life-and-death struggle and a struggle over values. Should the available dollars go for police patrol or for ambulance drivers or for a remedial reading program? As Key (1940) argued, the answer is not a matter of logic, but of preferences and priorities. Key (1940) posed the question of normative budgetary theory: “on what basis shall it be decided to allocate X dollars to activity A instead of activity B?” His answer was that in public budgeting it will be hard to find such criteria, because it becomes “a matter of value preferences between ends lacking a common denominator. As such, the question is a problem in political philosophy.” Later, elaborating on this question, Wildavsky (1961, 184) concluded that “a normative theory of budgeting, therefore, is utopian in the fullest sense of the word; its accomplishment and acceptance would mean the end of conflict over the government’s role in society.”

Any seasoned bureaucrat will readily admit that bureaucratic decisions—budgetary or otherwise—are often political decisions. Employees are hired to appease one or another influential individual; contracts are awarded to relatives of high officials; ex-officials become consultants at

lucrative salaries. Complicity in such actions is not for personal gain but for the sake of keeping peace. One of the first laws of bureaucracy is to not make enemies. Sometimes bureaucrats avoid making enemies by avoiding hard decisions, although a decision not to decide is still a decision, albeit a non-decision. Sometimes their interests are so threatened, as at the height of financial crises when they have been hard put to stave off severe budget cuts, that they become overtly political. To demonstrate their program's importance and to demonstrate the political costs of slashing their funds, they enlist their natural allies—worker organizations such as a fireman's union, client groups such as commuters, or a neighborhood such as that around a hospital. The representatives of special interest groups lobby vigorously, and often with the active cooperation of the bureaucracy involved, to restore budget cuts that a chief executive or legislative committee has proposed. The resulting budget document reflects the relative successes and failures of the various contenders. The same dynamics are at work on the federal, state, and local levels.

Bureaucratic discretion is often condemned as permitting uncontrolled actions by the bureaucracy, actions that may be considered unintended by policy makers or illegal by the courts. Should bureaucrats be able to make decisions with potentially important political consequences? The political power of the bureaucracy has not only been acknowledged as real, but, in the tradition of *Finer* (1941), was criticized on the grounds that too broad an assumption of power to administrative agencies is unconstitutional. An important critic of too broad administrative discretion is *Theodore Lowi* (1979). Since his *The End of Liberalism* first appeared in the late 1960s, Lowi has repeated that until the rise of the administrative state, the United States was a republic dominated by the legislature. This statement is true to the letter and ideology of the Constitution, claiming that all the power should reside in Congress (Article I). Because new interventionist programs of the government gave discretionary powers to bureaucracy and were tailored to specific groups, they soon became captive to these interest groups. This new phenomenon is called *interest-group liberalism*, and it is based on its optimism, faith in government, fragmentation, and proliferation of interest groups. Such government is not very effective, and ideology is only important to the extent that it shows which politician is related to what group. This "delegation of broad and undefined discretionary power from the legislature to the executive branch" leads to "legiscide" (Lowi 1991) and ultimately deranges virtually all constitutional relationships and prevents attainment of the constitutional goal of balanced power, substantive calculability, and procedural calculability (Lowi 1993, 151). Lowi (1991) also criticized the open-ended entitlement legislation on epistemological grounds, arguing that instead of holistic, comprehensive solutions to problems that always snowball to more legislation with even wider discretionary power, a pragmatic piecemeal approach to every problem should be applied.

In response to criticism by Lowi and others, there have also been arguments for discretionary powers of public agencies, for delegating authority to experienced bureaucrats, for implementing and interpreting legislation under principles of administrative law. For example, taking a step beyond the thesis of *Long* (1952) that bureaucracy is the most representative American governmental institution, *John Rohr* justifies public administration on the grounds of truly microcosmic representation of the American public (because there are no elections, public administration can be rational and implement policies like affirmative action) (Rohr 1990, 72). *Warren* (1993) does not see a point in debating the legitimacy of public administration—it is more than legitimate. Warren sees the administrative state as legitimate for two reasons: it is a response to people's non-decreasing demand for services; its legitimacy of the administrative state was upheld by the courts. A defense of administrative discretion based on empirical evidence is offered by *Brower and Abolafia* (1996) who consider procedural entrepreneurship as resisting established routines and enacting alternative channels to accomplish an organization's work. They see procedural entrepreneurship as more than necessary to cope with the tension between the normative pressures for administrative neutrality and the pressure to innovate to accommodate changing demands.

One way to make this policy-making process more objective is to make it more logical. Furthermore, perspectives on how decisions are made are often the framework for fuller models of policy-making. The rational-comprehensive school, for instance, argues that the best decisions are made logically. Advocates of rational-comprehensive decision-making hold that all consequences of a decision should be accounted for and that making policy in bits and pieces may blind policymakers to the overall consequences of their decisions. However, even the advocates of this school do not speak about absolute, all-encompassing rationality; rather, they discuss the concept of “bounded rationality” (Simon 1997). They hold that although rational-comprehensive decision-making is impossible, one should approach it as closely as possible.

Alternatively, incrementalists defend the muddling through process as more realistic, as being able to respond to the interests of many groups without freezing out any, as being able to respond to crisis pressures and deadlines, and as not requiring the massive investments of time and effort that logical decisions necessitate (Lindblom 1959). Decisions to implement policy are usually made in small steps, incrementally, rather than through an all-encompassing, rational plan. Incrementalists argue that crisis pressures and deadlines limit the amount of time that can be devoted to analysis. The incremental approach constitutes muddling through, selecting alternatives that are simply satisfactory and sufficient.

Incrementalism is criticized from many angles. It is often attacked on the grounds that it justifies the status quo and ignores the possibility of fundamental change (Dror 1964). Critics of incremental decision-making also question the consequences of such a mode of action. They ask: Do programs that develop incrementally tend to persist and grow over the years without any real scrutiny? Does incremental policy-making obscure the overall perspective? One response to incrementalism has been sunset laws that mandate periodic evaluation and weeding out of programs. In the 1970s, Colorado pioneered in passing a sunset law at the urging of the citizens’ organization, Common Cause. Under sunset legislation, an agency or program automatically goes out of business at the end of a given period unless the legislature acts specifically to renew or modify it.

Another perspective on the decision-making process has been Amitai Etzioni’s “mixed scanning” approach, which tried to “explicitly combine (a) high-order, fundamental policy-making processes which set basic directions and (b) incremental ones which prepare for fundamental decisions and work them out after they have been reached” (Etzioni 1967, 385).

Decision-making is far less rationalistic in the garbage-can model of decision-making where problems, solutions, decision makers, and choice opportunities are independent, exogenous streams flowing through a system that couple randomly (Cohen et al. 1972). As previously argued, these models of decision-making often serve as a framework for explaining the political role of bureaucracy in the process of governance. For example, both Kingdon’s (1984) study of agenda setting and March and Olsen’s (1989) neo-institutionalist model of politics are based on the garbage-can model of decision-making (though different readings of it); likewise, the iron triangle model is based on Lindblom’s incrementalism.

Theorizing public administration more consciously in a political democratic framework is the main thrust of Idea Three, which has been gaining more and more attention in the field. The big questions identified by Kirlin (1996, 2001) fall within this line of literature that is in contrast to the big questions identified by Behn (1995) from a more public management perspective (micromanagement, motivation, and measurement). Kirlin (1996) proposes seven big concepts for the field: (1) tools of collective action supporting a democratic polity; (2) appropriate roles of nongovernmental collective action; (3) tradeoffs between designs based on function versus geography; (4) national versus local political arenas; (5) decisions isolated from politics; (6) balance among neutral competence, representativeness, and leadership; and (7) societal learning. Cook (1998) argues, from the belief that public administration is a political institution, that the conception of public management should be grounded in regime politics and the education and leadership of public administrators should consider this political standard. The “bring politics back” voice has never disappeared (e.g., Mayer and Khademian 1996).

V. IDEA FOUR: HUMAN BEHAVIOR

Turn-of-the-century reformers were concerned with the means to efficiency: getting the job done with a minimum of wasted energy. Although management theories primarily derived from the private sector did provide an understanding of the organizational skeleton, they proved to be inadequate for satisfactorily explaining behavior in organizations, public or private. In particular, they failed to account for the complexity of human nature or for the impact of an uncertain and changing environment.

An important tenet of the management model was the assumption that in exchange for a fair day's pay, someone competent could always be found to fill any vacant slot in the organization or to complete any task. Classical administrative theory assumed that the only factor that motivated people to work was money. Money would be a sufficient motivator, whereas personality, individuality, and social interests were irrelevant to job performance. That theory is still held by many managers today.

Human behavior theorists maintain that in their actions people are encouraged and discouraged by many other incentives and stimuli in this action; they have needs other than remuneration. For example, in the most popular theory of motivation, Maslow (1943) identified five levels of needs: (1) physiological needs, such as food and shelter; (2) safety needs; (3) belongingness or a desire to be part of an informal social group; (4) esteem and status needs; and finally, beyond these needs, the most powerful motivator may be (5) a need or desire to self-actualize—to do work that is personally meaningful or fulfilling. Of these needs, the lowest dissatisfied need was suggested to be the strongest motivation of a human being. Of course, Maslow's as well as others' theories of motivation (e.g., Herzberg et al. 1959; McClelland 1961; Vroom 1964) did not deny that money motivates. Rather, they underscored the complexity of human nature, and they pointed out many other mechanisms of motivation.

The behavioral model stresses the importance of human relations and personal goals. If the closed model concentrates primarily on a technical system of organization—a system that produces products or services or maintains operations—the behavioral model recognizes the equal importance of the social system—a system composed of the employees who operate the technical system. This model is a modification of the closed model that brings to management's attention the social and psychological sides of organization. The focus of the model is still internally directed as in the classical model insofar as it is mostly concerned with internal management of an organization. But it recognizes that people in organizations often interpret things differently and have different concerns and worries. So, in essence, this approach is more flexible and accommodating.

The majority of organizations in modern society follow this model. Most managers understand that, first of all, they deal with people; therefore, they are concerned with the employees' emotional and psychological well being. Any technical system can fail, and often does, when the social and psychological needs of the people operating the system are neglected. There is a need to look behind the formal structural charts of an organization to the informal organization to grasp the complexity of cooperative human endeavor. This perspective has gained hold in organizational science in the United States since the 1940s, especially when the Hawthorne Studies became widely publicized prior to World War II.* This was partially due to social science's establishing itself as a legitimate field of study, which facilitated a more human perspective on such concerns as organizational effectiveness.

The term *informal organization* was introduced to the management literature by Barnard (1938) who defines formal organizations as cooperative systems and appreciates the importance of common purpose, cooperation, communication, informal organization, and dynamic equilibrium. The first documented study of the phenomenon by management specialists was known

*Hawthorne studies were not embraced by all. Organized labor long disregarded or opposed to it, and many studies questioned its basic assumptions. See Wren (1994) for details.

as the Hawthorne Studies. In their experiments in the late 1920s and 1930s, in Western Electric's Hawthorne, Illinois plant, Mayo (1945) and Roethlisberger (1941) revealed that the primary working group (or the arrangement of everyday, routine working relations in the group) was as important for productivity as physical facilities and monetary remuneration. As the Hawthorne Studies indicated, a group has its norms as to appropriate attitudes and behavior on the part of its members. These norms are enforced through sanctions in the form of social and other informal pressures on deviant members. In general, groups serve the organization by providing social satisfactions and control. But it can also happen that the selfish goals of a group displace the goals of the overall organization. As critics of the Weber model have pointed out, the actual functioning of a real-life bureaucracy leads to situations of goal displacement where members treat the rules as if they were major ends in themselves; sometimes, they take goal displacement to the point of suboptimization, regarding their departmental interests as more important than broader organizational goals.

Barnard (1938) argued that the informal organization was fulfilling necessary functions for the organization (which, in Barnard's definition, is a cooperative endeavor), namely, communicating, maintaining cohesiveness in a formal organization, and supporting the employees' feelings of self-respect and integrity. Barnard also argued that as formal organizations create informal ones, informal organizations give rise to some form of formal organization that makes explicit relationships and attitudes that have developed informally.

An informal organization system is considered to fulfill the following functions: (1) augment, interpret, speed up, or alter the formal communication system (or lack of it); (2) regulate the flow, extent, manner, and enforcement of formal authority; (3) humanize the formal organization by helping to maintain a feeling of individuality of the members while providing some security, unity, and integrity at the same time; and (4) meet related psychological and social needs to such an extent as to give the impression of being the organization (Banki 1981).

Informal organizations can soothe frictions that arise in formal organizations. Although, as a function of inertia, they may resist change, informal organizations are agents of change. As such, the informal organization may be considered as a modified and advanced form of task force and team-building activities. It deals with those urgent problems or opportunities that affect the organization as a whole and which involve more than one unit of organization. Usually, these are problems focused on the future; they are new to an organization and extremely complex. In informal organization, hierarchy-based relationships and attitudes are set aside to facilitate creative problem solving (although unintended outcomes may be dysfunctional). In such an interpretation, the informal organization uses task-oriented, team-building activities that involve a change agent, data gathering, feedback, and process consultation. Informal organizations can identify and solve systemic problems which have not been solved by the formal organization, therefore creatively complementing it. Both organizations contain the same people. The output of the informal organization represents an input to the formal one. The success of the former is linked to that of the latter (Huczynski 1987; Zaud 1981).

The behavioral model also stresses the responsiveness of organization to internal conditions and to the external environment. It underscores the need for more decentralization and less hierarchy, weaker chain of command, and more freedom for lower-level managers in the decision-making process. Not only managers but also other employees are expected to be part of decision-making. They are encouraged to work in problem-solving teams led by people who do not occupy high positions in the hierarchy but who are recognized (because of their personal accomplishments and ability) as able to build successful relationships. Constant training and learning of both employees and administrators is supposed to be one of the major concerns of management. The idea that use of informal structures can lead to better performance is not new. In 1951, researchers at the Tavistock Institute in England studied the adjustment problems of informal work organizations when the ownership and technology of the coal mines changed (Trist 1963).

This five-year study illustrated that sizable informal work groups in several mines, when allowed to be self-regulating, were more capable of adapting to changes in the technology of work.

The behavioral model is a transition from a closed to open model. The open model (organic, systemic) is a concept describing organizations where authority and expertise are shared, hierarchy is less important, horizontal lines of communications dominate, and immediate response to environmental change is one of the basic managerial strategies. Essentially, organization is viewed as a social system of human interaction rather than group of humans attached to a certain technology. Though some routinization and standardization are essential components of effectiveness in any formal organization, the open model gives priority to creativity and innovativeness.

In the open model, an organization's decision-making process is totally decentralized and is by consensus rather than by individual judgment of the formal (or even informal) leader; formal rules and instructions are almost eliminated; broad cross-disciplinary skills are of great importance; and the number of managerial levels is held down to the minimum.

Studies of behavior within organizations have consistently found that the most productive employees do not function optimally under a man-as-machine model that presumes laziness and irresponsibility and is prevalent in many areas of the world. Wages and fear are obvious motivators and widely utilized. But they are productive only at relatively low limits. Research and experience found that even organizations with well-paid employees could not expect high productivity unless they took higher order psychological needs into account. Simple, fear-based assumptions were not valid; people remain individuals, even in the workplace, and are affected and moved by many forces. Money is only one. As individuals, they can be turned on or turned off by their organizational roles, depending on what the situation offers them psychologically, and whether the organization treats them as mature, vibrant adults or as lazy, dependent drones. Management theorists have come to realize that people tend to join social groups on the job, and these groups develop production-oriented norms of their own to which the individual is expected to adhere. In particular, public servants may have more intrinsic motivations than their extrinsically motivated private sector counterparts. Human behavior, therefore, reflects not only organizational but also personal and group pressures.

Douglas McGregor, Rensis Likert, and Chris Argyris contributed to defining the theory of *Organizational Humanism*. Differing from the simpler perspectives of scientific management and the human relations school, they held that work could serve as a source of motivation and satisfaction to the worker. Building on Maslow's theory of human needs, McGregor (1960) classified managerial assumptions about human nature into Theory X and Theory Y—the hierarchical and the interpersonal. Theory X assumes that people do not like work, shun responsibility, and prefer to be led. Motivation is in response to threat or punishment. Theory Y holds that people are intrinsically motivated, have the potential for self-development, and a capacity to assume responsibility. They prefer, and can provide, self-control in achieving organizational goals. According to McGregor, management practices are largely shaped by these diametrically different views. Depending on the circumstances, success can be reached through either approach. As organizations become more complex, however, managing becomes more complicated. Theory X assumptions are less helpful; Theory Y styles of management recognize that delegation of authority, job enlargement, and participation must get more recognition.

The model of effective organizational structure, developed by Likert (1961), consists of participative work groups as an important source of individuals' need satisfaction. By creating supportive relationships, managers can facilitate the productivity of such groups. Likert also constructed a typology of organizational leadership. He distinguished four types of leadership style: (1) exploitative authoritative, (2) benevolent authoritative, (3) participative consultative, and (4) participative management systems. Research found systems 3 and 4 to be more productive (Hollway 1991). On the other hand, critics of this theory argue that whereas managers' preferences are invariably with system 4 (democratic participative management), in reality, most organizations practice the benevolent authoritarianism of system 2 with success (Perrow 1987).

Argyris (1957) also emphasizes the human condition's importance where the individual and the formal organization as two elements are often in conflict, seeking separate goals. Argyris (1957) contends that "the formal organization creates in a healthy individual feelings of failure and frustration, short time perspective and conflict." The management model's chain of command, unity of direction, span of control, and task specialization are repressive and restrictive devices that are dysfunctional insofar as they deprive individuals of their potential for growth and self-actualization. Argyris suggests that individuals' participation in decisions affecting their work will give them greater job satisfaction and generate higher productivity.

From a systemic perspective, however, individual motivational factors are necessary, but insufficient. Recognizing that insufficiency, the Organization Development school has as its goal the integration of individual and organizational objectives in "a long-range effort to improve an organization's problem-solving and renewal processes, particularly through a more effective and collaborative management of organization culture." It takes the "ongoing work team, including supervisor and subordinates" as its foundation and "puts a primary emphasis on human and social relationships" (French and Bell 1973, 15–20).

As a function of Idea Three, these theories of individual and group behavior are widely taught in public administration programs and are adopted within many government agencies. Psychological motivators are particularly important in an arena where pay lags behind the private sector. For many people, government is where the meaningful action is, not necessarily where the pay is. Civil servants often feel they are a part—however, small—of something worthwhile (Rainey 1997).

But government has also begun to recognize that an unanticipated consequence of the bureaucracies established to serve the public is their disservice to their own employees. In place of incentives to produce, there are often pressures to be mediocre. Somehow a new, bright, eager public servant quickly receives messages not to work too hard, not to outperform his or her superiors, and not to rock the boat. He or she becomes an individual who has bartered conscience for security, a survivor, a faceless product of the necessity to go along to get along. In short, they are successful bureaucrats who maximize their individual benefits while giving minimal attention to client responsibilities. A lackadaisical attitude is often reinforced by the knowledge that nonperformers are seldom fired.

Following this line of reasoning, Merton (1940) discusses the impact of bureaucratic structure on personality and points out some bureaucratic dysfunctions: trained incapacity, goal displacement, overconformity, and impersonality. Hummel (1994) outlines several effects of bureaucratic organization on people:

- The top-down structuring of work creates the kind of passivity where employees wait for the hierarchy to tell them what to do.
- The self-concept of the functionary in bureaucracy develops in terms of organizational identity, integration and similarity in relation to the rest of organization. In this way, bureaucracy creates dependency of the individual self on structures of the organization.
- People are viewed as interchangeable, functional elements of a system and qualitative differences between them do not make a functional difference. Quantitative measurement is a standard for what is real.
- By instilling the practice of analogous thinking, bureaucrats are trained to act only when they recognize aspects of reality matching predefined models for action.

Several other theorists have analyzed human experience in organizations from subjective interpretative perspectives. Denhardt (1981) applied a critical perspective for analyzing human existence in the shadow of organization, referring to unrecognized or unwanted drives and desires as the other side of the conscious ego. The phenomenological approach has been applied to studying political aspects of bureaucratic life (Harmon 1981; Jun 1986) and internal workings of

bureaucracy. It often uncovers the patterns of organizational control that trap people in unsatisfactory modes of existence. Focusing on cognitive processes that are related to death, family, sexuality, anxiety, greed, fear, hate, and libidinal drives, this line of research illustrates that rationality is disguised irrationality and human beings are often trapped in a world of their own creation, as labeled by Morgan (1997) with a “psychic prison” metaphor.

Theorists of organizational learning and learning organization have constructed a contemporary behavioral model of human performance. According to Chawla and Renesch (1995, 243): “An organization’s ability to survive and prosper in our turbulent age requires new ways of thinking and organizing... It demands the confluence of two streams of thought...continuous improvement (Kaizen) and continuous learning.” The concept of learning was made popular by Argyris and Schön (1974) and Argyris and Schön (1978). They differentiate single-loop learning, referring to detecting and correcting error within a given set of operating norms, from double-loop learning, referring to questioning the relevance of the operating norms. Their work shows that bureaucratic organizations, because of the fragmentation and bureaucratic accountability systems, tend to create defensive routines that obstruct the learning process. Senge (1990) popularizes the concept of “learning organizations” from a nonlinear perspective of system dynamics and complexity theory. He urges people to renew their vision and commitment, reexamine their relationship with the environment, and develop an ability of questioning, challenging, and changing operating norms and assumptions. These concepts have been adopted in public administration research (Brown and Brudney 2003; Leeuw et al. 1994; Little and Cayer 1996).

Efforts have been made to demonstrate the difference in organizational behaviors between public and private organizations. In general, many studies find a lower valuation of monetary incentives and a higher level of public service motivation in public employees. Many studies also find that public employees have lower levels of job satisfaction and organizational commitment than their private counterparts (Rainey 1997). However, studies about publicness of this sort usually have mixed results because of issues related to sampling and measurement. One significant theory is about public service motivation proposed by Perry and Wise (1990) who argue that people with high public service motivation are more likely to choose government jobs, to perform better on the job, and to respond more to nonutilitarian incentives. Although Alonso and Lewis (2001) find mixed results in terms of Perry and Wise’s theory, Brewer et al. (2000) identify four distinct conceptions of public service motivation in practice: samaritans, communitarians, patriots, and humanitarians. Whether the concept of public service motivation is valid seems to be a debatable question, but it holds true that the distinctive mission, value orientation, and democratic control of public organizations influence the emotions, cognitions, attitudes, and behaviors of public employees. Such a behavioral perspective can provide valuable insights for public administration researchers and practitioners (Denhardt et al. 2002).

VI. IDEA FIVE: PROGRAM EFFECTIVENESS

In the era of Weber and Taylor, the environment that an organization functioned in was relatively steady, and the government’s tasks were limited and simpler than today. The years since have seen rapid change, and the demands upon government have become multidimensional. Although not always very timely and state of the art, the response of public administration has been more than adequate; through building and reinforcing multiple capacities, it has managed the American welfare state successfully. World War II gave rise to operations research, a science of maximizing allocation of limited resources for attaining maximum benefit that emerged as a policy tool useful in coordinating large-scale logistic efforts of the armed forces. Since the 1950s, the systems approach has become a framework for analyzing public programs. Versions of this approach include cost-benefit analysis, institutionalized use of which, in the United States, is often

traced back to the Flood Control Act of 1936 (Hatry 1982, 167). By the 1950s, it had become an established feature of water-resources policy. Cost-effectiveness analysis gained momentum in the Department of Defense at the beginning of the 1960s when the Secretary of Defense Robert McNamara initiated the Planning Programming Budgeting System (PPBS)—a programmatic approach of systematic comparison of different programs in terms of their unit costs or effectiveness per dollar spent. To put the massive governmental effort of the War on Poverty on scientific rails and to answer questions about the effectiveness and efficiency of Great Society programs, President Johnson ordered the use of PPBS for all executive agencies in 1965 (it was officially terminated in 1971). An entire cottage industry of policy analysis and program evaluation emerged.

A variety of approaches have been proposed for program evaluation (e.g., Chelimsky 1989). Although these studies have been largely cast in terms of economic efficiency and effectiveness, they also incorporated some perspectives from organizational sociology and other related disciplines. An influential study of public policy implementation in Oakland, California, by Pressman and Wildavsky (1984) gave rise to yet another stream in this direction for public administration: how programs are implemented and these processes' obstacles. In their analysis, Pressman and Wildavsky (1984) not only paid attention to the program's economic benefits, but they also underscored the importance of the complexity of joint action. Implementation studies have since proliferated, and many frameworks have been proposed (e.g., Alexander 1985; McLaughlin 1976; Sabatier and Mazmanian 1979).

Post-World War II expansion of government services and a growth of knowledge in public administration and in the field of social science in general were proceeding against the background of rapid change in society—technological, social, and legal. Such rapid change means less predictability in the life of governmental agencies. Worker skills and expectations have changed; technology has changed; neighborhoods and cities have changed; and clients' needs are constantly changing. The policies, programs, or procedures that were appropriate even five years ago may no longer suit an agency's clientele today. Currently, it is not possible to develop slowly the one best way and then continue to use that way without question. Instead, activities must be constantly monitored and questioned in terms of their effectiveness.

In response to this change and armed with a wide range of existing theories of public administration (which, as argued above, usually concentrated on limited aspects of concerns), public administrators have tried to develop more holistic approaches that would address public problems in their complexity and in a systemic manner since the late 1960s and early 1970s. The idea of Program Effectiveness was built not only on the productivity movement, but also on other integrative approaches. In particular, the notion of effectiveness has expanded to include such concerns as unintended consequences, misuse and abuse of power, and ethical stops ranging from the inner check to whistle blowing. One such attempt at having a more holistic and ethical science of administration was the New Public Administration (NPA), which was born at the Minnowbrook I Conference held by Syracuse University in 1968 (and reevaluated twenty years later at Minnowbrook II), and other symposia that helped develop a concept of effectiveness linked to ethics and responsiveness.

Responding to social unrest and political change during the 1960s, NPA emphasized participation, decentralization, and representative bureaucracy. The NPA, as defined by young public administration scholars, was rooted in the experience of the 1960s, and in particular, a belief that public administrators could solve the country's technological and social problems (LaPorte 1971; Marini 1971). It was argued that public administrators should and could act as agents of change (Crenson 1971). As conceptualized, the "New Public Administration seeks not only to carry out legislative mandates as efficiently and economically as possible, but also to both influence and execute policies which more generally improve the quality of life for all" (Paynter 1971). Frederickson (1971, 1976) argued that, "It's abundantly clear that administrators are not neutral. They should be committed to both good management and social equity as values, things to be achieved."

The NPA held that (Marini 1971):

- Ethics, honesty, and responsibility in government had returned to the forefront of public administration. Career service bureaucrats were no longer considered to be merely implementors, but to hold a public trust to provide the best possible public service.
- Social equity was increasingly complementing efficiency and economy as the rationale or justification for policy positions.
- Questions of public policy were becoming as significant as those of public management.
- The rational model and the usefulness of the strict concept of hierarchy were severely challenged.
- Government should be responsive to the needs of the public. Unneeded and ineffective organizations or programs should be discontinued.
- Effective public administration had to be defined in the context of an active and participative citizenry.

Participation was supported both as a political process and as an organizational process. Political participation was viewed as a mechanism for dispersing power and increasing citizen involvement in government (Waldo 1984). Organizational participation was to be a means for procuring change and dispersing power within the organization. Representative bureaucracy was meant to produce client-centered administration and representation of clientele interests by administrators.

The movement to revitalize government and to reverse pressures toward centralization of power, passivity, and mediocrity developed within the federal government. A decade after Minnowbrook I, President Carter initiated major reforms to the federal civil service system in 1978, including provisions for individual incentives and greater accountability. Similar programs are instituted at the state and local levels. Commissions on public service have continued the impetus to revitalize it. The National Commission on the State and Local Public Service, chaired by former Governor William Winter, following the lead of the Volcker Commission (1989) delivered *Hard Truths/Tough Choices: An Agenda for State and Local Reform* (Winter 1993). The Volcker and Winter Commission reports define an ambitious agenda—dozens of basic changes for improving federal, state, and local government.

The recommendations of the Winter Commission present a fundamental agenda for changing the way state and local governments relate to, as well as deliver services to, their citizens. According to Chairman Winter:

Making democracy work is what state and local public service must be about. It is here that the actual delivery of the most basic and essential services take place.... An obvious part of the process of addressing the problems that face us as a society is examining the structure of government and determining how it can be better organized to do its job more efficiently. This must be a continuous activity, and one sufficiently dynamic and broadly based to resist those defenders of political turf who would argue for maintaining the status quo. But there is another measure of governmental performance that is even more important: the human dimensions of public service (Winter 1993, vii).

Richard Nathan's* commenting on the report argues that there are five central values that should be pursued by governmental reinventors in the 1990s: (1) advancing political accountability and responsiveness to citizens; (2) strengthening the capability of government to make and

* Richard Nathan's comments were made during the National Center for Public Productivity Annual Conference in Scottsdale, Arizona 1993.

implement tough choices; (3) providing fresh talent to government; (4) reducing the unhealthy power of special interest groups; and (5) bringing about a more honest dialogue between citizens and their governments.

Symposia and reports, however, created insufficient momentum to maintain support for government at the level of the New Deal and Great Society programs. From the perspective of citizens, at the bottom of the political structure, the public sector had to deliver as promised. Concurrent with the development of theories of responsiveness and implementation of civil service reforms, the productivity movement developed as a means of integrating and implementing all ideas (i.e., Ideas 1–4) initiated in the development of public administration to date. Its goal was to achieve tangible improvements in service delivery, especially in outcomes as opposed to an emphasis on outputs.

The improvement of public sector productivity, so that public organizations might more readily achieve their goals, became an interdisciplinary concern. The necessity for productivity improvement is a recurring theme in economic, technological, and social arguments, as they are emphasized by chief executives (elected and appointed), media, corporations, economists, public administrators, and public citizens. Improved standards of living and sociopolitical stability are closely linked to improved productivity.

In this context, *productivity improvement* is taken to mean capacity building (i.e., infrastructure and knowledge which are the prerequisites for expected performance) and actual performance improvement. Productivity improvement is a complex undertaking. Productive management, public and private, has evolved from simple common sense in the late nineteenth century to complex systems in the late twentieth century. To produce public services, the best public organizations have developed multiple, reinforcing capacities, integrating advanced management techniques, applying quality management principles, using measurement as a decision-making tool, working hard to motivate employees, adapting new technologies, and developing public-private partnerships.

In Figure 2.6, a systematic scheme for diagnosing productive improvement is proposed. It is a comprehensive framework where identifying critical problems and opportunities may begin. The four major elements of the framework are informational, social, technological, and managerial. Political (in terms of Idea 3), although not one of these four elements, should not be dismissed as a

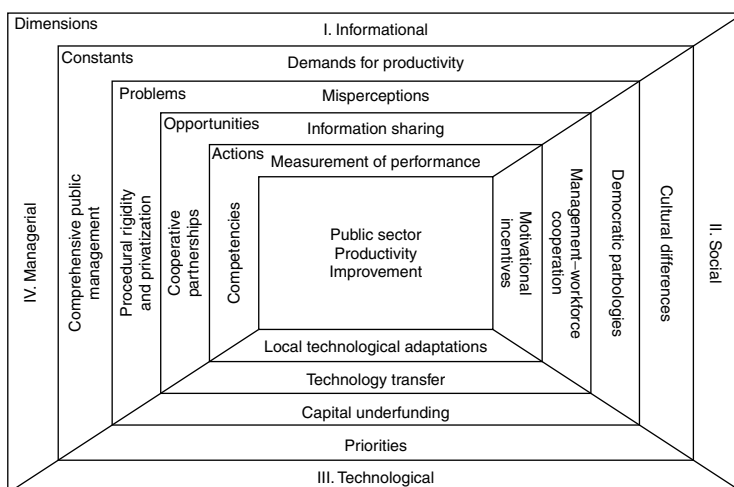

FIGURE 2.6 Public sector productivity improvement.

pertinent concern. Rather, it is a permanent environmental condition that pervades, or surrounds, the other four.

Across each of the four elements, four categorical bands emerge from the literature:

1. Constants or factors that are not amenable to change in the short run (one to three years). These include: demands for productivity; cultural differences; state priorities; and public management's scope.
2. Problems or obstacles to capacity building that must be addressed in a comprehensive productivity program. These include: misperceptions of productivity; bureaucratic pathologies; capital management; and large organizations' stereotypical rigidity.
3. Opportunities or positive approaches to capacity building. These include: information sharing; management–workforce cooperation; technology transfer; and organizational structures, systems, or controls.
4. Actions or specific programs. These include: measurements of quantity and quality; motivational incentives; local technological adaptations; and management–workforce training.

A. INFORMATIONAL FACTORS

1. Constants: Demands for Productivity Improvement

Government's customers are increasingly questioning the efficiency and effectiveness of public services. Terms such as *productivity*, *productive*, and *produce* are achieving greater prominence as progress is demanded by impatient constituencies: citizens seeking higher standards of living, corporations seeking investment opportunities, financial institutions seeking to safeguard their investments and loans, news media seeking to ferret out problems, and politicians or policy-makers seeking national self-reliance. Despite their diversity of interests, all such constituencies seem to agree that governments, public enterprises, and non-profit organizations should produce the same services or goods with fewer resources or higher levels of output with the same resources. They are asking for better information to judge progress against.

2. Problems: Misperceptions

Regardless of the functional bounds of the public sector, the concept of productivity suffers from misperceptions, fears, and myths: outputs and outcomes cannot be measured; workers will not cooperate with labor-saving technologies; productivity improvement will automatically mean a loss of jobs; managerial risks will outweigh rewards. Because the term and its derivatives almost automatically meet with such objections, productivity programs must operate under other titles: efficiency, management, performance, capacity building, capital investment, quality control, etc. (Holzer and Halachmi 1988). Through whatever means, programs to improve public sector efficiency and effectiveness by increasing worker motivation and skills, by strengthening management and measurement, by reorganizing jobs and work processes, by technological and operational innovation, or by any array of approaches, they are, indeed, productivity programs.

Despite government's considerable accomplishments, popular images reinforce the misperception of bureaucratic incompetence. Press reports are almost uniformly negative, shaping a bias against public bureaucrats that is reinforced daily by the image merchants. Public servants are stereotyped as bumbling bureaucrats. They are perceived as underworked and overpaid for jobs that anyone can do. They are unbusinesslike, and they lack ambition and common sense.

The public sector does improve its performance. In the United States, thousands of entrepreneurial, award-winning programs are successes in stretching resources, in building problem-solving capacities, and in helping solve some of society's most difficult problems (EXSL 1989–1995). They are not unusual. Government quietly harbors thousands of innovative projects, and it has accomplished much over decades. Pressured public administration is continuing to improve in pragmatic, productive terms. There is an increasingly sizable and sophisticated body of knowledge about effective productivity improvement programs, a body that is cumulative and that dates back several decades (Holzer and Halachmi 1988).

3. Opportunities: Information Sharing

A prerequisite to improved productivity, therefore, is improved information. It is freely shared and transferred on a mutually advantageous basis between sectors, organizational decision makers, and the workforce. Such interconnections between knowledge and productivity are perhaps clearest in the agricultural sector: America's best-educated farmers are the world's most productive.

Society expects professionals to be current. Yet, where there is a great deal of innovation in government, there is also a great deal of ignorance of innovation. Some cases are reported widely, but too few of the many successful projects have been widely replicated despite the appropriate adage that plagiarism is a virtue. In part, the fault lies with myopic professionals who do not search beyond the borders of their own disciplines, or who are lethargic or smug about the knowledge base they might tap to improve their performance. In large part the fault is also with a budget process that is political and shortsighted with regard to intangible investments. Frills such as conferences, journals, and professional memberships are viewed as irrelevant or as having indefinite payoffs; they do not tend to survive the budgeting process, losing out to the more immediate needs of crumbling public works or weak crime control. At best, professional knowledge is usually treated as a discretionary expenditure rather than viewed as a necessary investment. Without access to the relevant analyses and case studies, public administrators keep making the same mistakes, reinventing the same wheels, and missing the same possibilities. For example, most public managers are unaware of models that have been painstakingly developed in other jurisdictions or research centers, models which can be adapted for comprehensive productivity improvement in an environment of increasing demands and reduced resources. One example is the Ten Step Model (Holzer 1994) that was synthesized from examinations of scores of cases:

1. Clarifying goals with, and obtaining support from, top management and elected officials.
2. Locating models as successful blueprints to modify and as warnings of potential mistakes.
3. Identifying promising areas, such as those functions faced with large backlogs, slipping deadlines, high turnover, or many complaints.
4. Building a team through which all interested parties—particularly management, labor, and clients as well as possible partners in provision of the service—can identify obstacles and suggest improvements.
5. Planning the project, including objectives, tasks, responsibilities, and time frames.
6. Collecting program data and measuring progress against financial and service data.
7. Modifying project plans based upon periodic and continuing discussion of problems, opportunities, and priorities.
8. Expecting and addressing potential and actual problems such as misunderstandings, misconceptions, resistance, and slippage.
9. Implementing improvement actions on a routine basis, without fanfare and unnecessarily raising expectations.
10. Evaluating and publicizing results, building political and professional support that will justify the program and its expansion to meet increased demand of services.

As with any other generic recipe, this type of model should be modified and adapted to a specific organizational context. Real cases will always be slightly different than the model; in some cases, one or two steps would be missing because of the organizational and cultural assumptions of the situation. In other cases, several steps can be combined in one. Because the steps of the model are analytically distinguishable, the model is useful for analyzing real organizations and programs as a means of highlighting the strengths and illuminating the weaknesses of cases under discussion.

Government needs to be aware of, and then apply, its own successes, models, and conceptual roadmaps. Strategies for public performance improvement are being reported analytically and clearly in hundreds of publications and conferences (Cherry and Holzer 1991). Public organizations need to mine the mountain of knowledge—join computerized networks, share successful and unsuccessful experiences, attend conferences, and treat their managers as professionals by making it easier to do so.

4. Actions: Measurements of Performance

In an environment of tax revolts and fiscal crises, questions of measurement are implicit in citizen complaints: “The neighborhood is more dangerous.” “The streets are dirtier.” “The schools are worse.” They often answer their own questions with dramatic stories, rumors, and personal experiences. Public executives should be able to answer those charges with data. But answers are only a black-and-white snapshot of a problem-solving attempt; more data can help diagnose a problem–response pattern.

It is often argued that measurement is a requisite tool—or pressure—for accountability and improvement, including improvement in shared access to information between units of government (as suggested above) and between decision makers and stakeholders (Fountain 1992). The goal of service delivery would be well served if debates about service allocation and resource utilization were guided by objective criteria. Perhaps the most valuable and specific forms of information are contained in measures of service or product quantity and quality. Productivity’s state-of-the-art measurement is such that policy-making and policy-implementing officials no longer need bow to casual assumptions that government’s productivity cannot be measured or evaluated. Quantitative approaches to the objective evaluation of government programs are especially evidenced by work throughout the United States. Taken as a whole, the literature defines a compendium of sophisticated measures for public sector outputs *and* outcomes.

Productivity measures help answer such questions as: Is an organization doing its job? Is it creating unintended side effects or producing unanticipated impacts? Is it responsive to the public? Is it fair to all, or does it inadvertently or deliberately favor certain groups? Does it keep within its proper bounds of authorized activity? Is it productive?

Management often has the hard data to construct those objective measures. If it does not, it can develop the information. As award-winning cases suggest, measurement of public services is conceptually sound and feasible: outputs and outcomes are measurable, data are readily available, and the results are not too complicated to use (EXSL 1989–1995). A measurement program offers an opportunity to develop and present feedback in place of generalized perceptions. According to a study by the US Government Accountability Office:

Managers can use the data that performance measures provide to help them manage in three basic ways: to account for past activities, to manage current operations, or to assess progress toward planned objectives. When used to look at past activities, performance measures can show the accountability of processes and procedures used to complete a task, as well as program results. When used to manage current operations, performance measures can show how efficiently resources, such as dollars and staff, are being used. Finally, when tied to planned objectives, performance measures can be used to assess how effectively an agency is achieving the goals stated in its long-range strategic plan. Having well-designed measures that are timely, relevant, and accurate is important, but it is also important that the measures be used by decision makers (GAO 1992).

While productivity measurement is useful to the entire range of organizational actors, it is especially useful in staff analysts' and auditors' hands. Measures can be useful not just to internal decision makers, (i.e., managers and policy-level appointees). Measures can also help external groups, and even the press, improve their analyses by clarifying real, as opposed to suspected, problems.

That the momentum for measurement has advanced significantly is evidenced by a critical mass of research (e.g., Epstein 1988; Holzer 1992; Washnis 1980). Perhaps the most important and sustained effort has been by Harry Hatry and his colleagues at the Urban Institute (Hatry 1974, 1977, 1979; Urban Institute 1980). Here, the nuts and bolts of measurement are readily available.

The dialogue on public sector productivity measurement has continued quarterly since 1975 through the *Public Productivity and Management Review (PPMR)*, formerly *Public Productivity Review*, which emphasizes implementation of organizational goals and objectives; measurement of efficiency and effectiveness levels; cooperation between management, labor, and clients; and recognition of the fiscal, legal, political, and technological constraints to productivity enhancement. For example, the *PPMR* published measurement-related research on "governmental efficiency" (Rabin 1990), where Miller argues that "efficiency, equity and parsimony dictate government financial innovations, [and] that efficiency is (a) basic beliefs underlying public financial management" (Miller 1990, 333).

Productivity measurement is an important drive for quality initiatives such as TQM (Milakovich 1992). The Government Accounting Standards Board (GASB) has made major progress toward the development of objective measures. In 1987, the GASB adopted Concepts Statement No. 1 which addressed the need for financial reporting to assist in fulfilling government's duty to be publicly accountable (GASB 1987). The impetus for this research, carried out by GASB, was widespread concern that the financial reports of governmental entities do not go far enough in providing "complete information to management, elected officials and the public about the 'results of the operations' of the entity or its programs" (Fountain 1992). Public organizations routinely use measurement as a decision-making tool although application of these measures is uneven (GAO 1992; GASB 1990). Responding to the pressures of citizens, elected officials, and professional associations, governments have begun to develop programmatic measures of efficiency, effectiveness, quality, and outcomes (ASPA 1992, 1996; Bowsler 1992; Christopher 1986; GAO 1992).

B. SOCIAL FACTORS

1. Constants: Cultural Differences

Classical productivity models patterned on traditional private sector models, such as scientific management, view workers as inherently economic beings behaving productively because they are motivated primarily by a desire for wages. Adherents of traditional management principles presume that individuals want to retain their positions, are fearful of being fired, and will willingly follow the dictates of centralized authority, top-down communications, and other scientific management paradigms. But views of workers as economic animals do not always coincide with the reality that forces not evident on organizational charts do indeed control employees' actions. The complexities of motivation have been discussed in detail in such work as the Hawthorne Experiments, Theory Y, TQM, and the learning organization. Such forces may, for example, include religion (holidays and prayer periods), custom (working hours and breaks which differ from the 8-to-4 or 9-to-5 day), or reference group (family, friends, village).

2. Problems: Bureaucratic Pathologies

Although public bureaucracies are under increasing pressures to be productive, several tensions tend to subvert productivity improvement efforts. One such tension is bureaucracy's unanticipated pathological consequences. Large private and public organizations share an underlying ill—bureaucratic stagnation—that current, technologically oriented policy and research virtually ignore. Although bureaucracy is an efficient tool for both public and private organizations, it is apparent that unintended consequences of the bureaucratic structure have a very limiting effect on productivity. Too often bureaucracy is epitomized by the sufficiency of mediocrity, the “Don't rock the boat” adage, a stifling loss of independence, a misdirection of energies to solving personal problems of promotion, playing office politics, and abusing or discrediting fellow employees. Bureaucracies have degenerated into machines that may be too impersonal and too insensitive for effective, productive responses to public demands. Fueled by fears, such machines produce at very low levels and with many errors.

Messages that bureaucracy stifles productivity cannot be dismissed as simplistic, for many social science theories are grounded in the same assumptions. Osborne and Gaebler (1992) argued that the old bureaucratic model must give way to an entrepreneurial approach to public administration. The same tensions—bureaucratic control versus individual initiative—have been resurfacing for decades. They have staying power because the problems of bureaucracy are still unsolved, because the organizational sciences have not been able to change most organizations, and because bureaucracy is still perceived as violating the public trust.

Bureaucracies can be run by fear, but they run at a very low level of productivity. In the long run, if control versus dishonesty is the dominant mode, organizations fail—in a crisis, a crunch, or a competition.

3. Opportunities: Management–Workforce Cooperation

One means of overcoming such pathologies is joint management–workforce cooperation. Pressured public organizations are now recognizing that a prerequisite to productivity improvement and a counterforce to negative and misleading assumptions is cooperation between the organization's decision-makers and the workforce (defined as labor and middle management). It is by no means the traditional suggestion box. Under various rubrics the premises are that productive ideas are equally distributed within organizations, the top-down characteristics of bureaucracy must be replaced by an equal relationship that draws as much of its creative energy from the bottom as from the top, innovation and risk taking are made possible, all members of the organization are rewarded, and labor and middle management are given a major psychological stake in organizational improvement (Grace and Holzer 1992).

The cooperation of middle management is minimized if internal management consulting resources are overlooked. Hoover (1992) argues that change agents can perform a number of roles within the organization as a cost-efficient alternative to the use of external consultants for improvement projects. His premises are that the internal consultant is an important resource for improving organizational performance, there should be more internal consultants within governmental organizations, and they should be put to better use. According to Hoover:

Using existing staff to fill internal consulting positions has been quite successful when those staff are properly prepared for the task. Existing employees bring their experience and knowledge of the organizations and the operating procedures. They may be known by others within the organization, and particularly by those with whom they will have to work to perform successfully their assigned tasks. They will not be seen as outsiders by existing managers and employees (Hoover 1992).

But management does not have a monopoly on imagination or innovation. Productive ideas are distributed throughout the hierarchy. All organizations (in this case, public organizations), need to

recognize that a requisite element of productivity improvement is cooperation between the organization's leaders and its workforce (defined as labor and middle management). As TQM and other earlier strategies suggest, the top-down characteristics of bureaucracy can be replaced by an equal relationship that draws as much of its creative energy from the bottom and middle as from the top, makes innovation and risk-taking possible, and gives labor and middle management a major psychological stake in organizational improvement.

Bowman (1992) recommends one particular form of labor–management cooperation—quality circles that came into vogue during the 1980s and have been in the vanguard of the employee involvement movement.

To the extent that labor and middle management are treated as an agency's internal consultants, they are buying into the process of change. Although the costs are minimal, the potential payoffs are substantial: improved performance and cost savings; a workforce–management dialogue built on a continuing stream of reasonable ideas, without the expense of external consultants or interveners; positive feelings about being treated as problem-solving adults; and an enhanced sense of professional commitment at all levels.

4. Actions: Motivational Incentives

It is widely recognized that productivity is achieved only by tapping an organization's human potential. Guy (1992), for example, points out that many interdependent factors contribute to creating a productive work environment: organizational culture, team building that maximizes the employees' strengths while compensating for their weaknesses, open communication channels, flexibility in the midst of predictability, and balancing the needs of the organization with the needs of employees. Nonmonetary incentives that can reinforce a worker's natural desire (i.e., eagerness) to contribute to the solution of productivity problems are widely available: job rotation, enlargement, and enrichment; quality circles and joint labor–management committees; career ladders; awards and other forms of recognition; flexible working hours and job sharing; and improved working conditions among dozens of others.

Government's most extensive and expensive investment is people—most public organizations devote from 50 to 85% of their budgets to employee salaries and benefits. Because those human resources have complicated needs, the most progressive public organizations have adopted enlightened human resource practices, rejecting an authoritarian, bureaucratic style. Typically, they:

- Recognize that motivation requires management of many interrelated elements. Ban et al. (1992) hold that to achieve their goals, public organizations need to take an integrated approach to personnel management, linking workforce planning, recruitment, hiring, training, and other personnel policies. Building and maintaining a productive work force includes: (1) developing a formal work force plan; (2) actively recruiting job applicants; (3) redesigning tests or developing creative alternatives to written tests; (4) linking training and development activities to organizational mission; and (5) revising personnel policies to meet the needs of employees.
- Understand that money can be an important motivator, but it is not the only motivational option. A sense of being able to make a difference in the organization is more important to the job satisfaction of public sector managers than to that of private managers (Balfour and Wechsler 1991).
- Carefully apply performance appraisal systems. Daly (1992) points out that productivity is a function of motivation, and motivation—extrinsic or intrinsic—is itself a function of the recognition of an individual's work effort. Such recognition can come from a well-conceived and well-managed system of performance appraisal.

C. TECHNOLOGICAL FACTORS

1. Constants: Priorities

A third productivity building block rests on technology. A prerequisite for the peaceful, productive use of technology is a clear definition of priorities. Scarce capital is often spent to improve security in the form of police and prisons. But in a more productive environment, it is more likely to be directed to reinvestment for educational, scientific, and technical purposes.

2. Problems: Capital Underfunding

It is difficult to secure financing for public sector investments as elected officials are more concerned with minimizing short-term budgets than maximizing long-term productivity pay backs. Financing is an especially difficult constraint when public policies employ as many workers as possible (including seasonal use of the unemployed) and stress the use of human capital while mitigating against capital expenditures for new machinery, facilities, or equipment. Furthermore, investments are unavailable under the pressures of agreements to tighten belts, to cutback, to economize; it then becomes difficult to acquire resources for productive opportunities.

One problem is that public organizations are tremendously under capitalized. They lack the capacity to invest in such productive technologies as computers, telecommunications, vehicles, maintenance facilities, energy-saving devices, and energy-efficient buildings. In the long run, they may also lack the capacity to make investments in the workforce (i.e., in human capital) related to such internal capacities as training, education, and medical support services. In the long run they may also lack the capacity to invest in information-sharing mechanisms such as databases, clearing-houses, publications, research, and case lessons.

3. Opportunities: Technology Transfer

Productivity improvement is a matter of organizational technology as much as industrial technology. Such organizational machinery includes simple records of finances, time, and materials; organizational charts; job descriptions; written instructions, etc. Those suffice for productivity at an acceptably low level. But higher aspirations also require more sophisticated systems: computerized records, tracking systems, matrix organizations, Internet-based communications, etc. The extent an organization can move from the simple to the sophisticated, yet still provide fast, responsive action, is the extent it can be a productive model.

A predisposition toward labor-intensive organizations and cutback management should not be allowed to preclude appropriate technology (hardware and software) as a vehicle for productivity improvement. Complex technologies such as computers, telecommunications, remote sensing devices, and systems based on Intranet and the Internet as well as simpler devices such as hand tools, trucks, and telephones, may have appropriate and specific applications. The appreciation of such opportunities is, however, contingent upon diffusion of innovations.

In the United States, some government programs are effective vehicles for the diffusion of technology transfer (there are technology transfer programs within the Commerce and Defense Departments). A not-for-profit organization, Public Technology, Inc., is devoted to the development and diffusion of productive technologies for the public sector. Private sector vendors are another avenue of diffusion. Despite those efforts, even in the US, technological and other innovations may take decades before they are widely known or before adoption is relatively pervasive.

4. Actions: Technological Adaptations

Technology is only productive if viewed as part of an organizational system and installed in synch with appropriate changes in, or accommodations for, that system's workforce, environment, tasks, and information. For example, in implementing e-government transformation, Fountain (2001)

concludes that organizations have a tendency to “implement new IT in ways that reproduce, indeed strengthen, institutionalized sociostructural mechanisms even when such enactments do not use technology rationally or optimally” (90).

Advanced technologies are as important to the public as to the private sectors, and the public sector pioneers new systems. In the United States, government employees have invented (or contributed to the invention of) lasers, solid-state technology, the basic design of most commercial and military aircraft, instrument landing systems, the first modern computer, titanium (and other stronger and lighter materials), the Cat scan, plastic corneas, advanced fishing nets, nuclear power, Teflon, wash-and-wear fabric, resuscitation devices, and plastic wrap (Public Employees Roundtable 1990). NASA, for example, has a continuing program to help the private sector exploit innovations resulting from the space program.

Technology is not limited to computer applications. In an area as mundane as refuse collection, for example, departments of sanitation in New York City, Scottsdale, Arizona, and Phoenix Arizona, have developed and applied numerous technological changes (Holzer and Callahan 1993). As these examples indicate, the improvement of government performance may be contingent on the identification and adaptation of mundane technologies.

D. MANAGERIAL FACTORS

1. Constants: Comprehensive Public Management

A fourth requisite for improved productivity is competent public management of the infrastructure that makes productive work possible in the public and private sectors: schools, financial institutions, health care, telephones and telecommunications, airports, railroads, ports, roads, postal services, etc. An educated middle class is a prerequisite for training new first-line supervisors. Efficient postal services and communications networks are prerequisites for timely decision making. Reliable financial institutions are prerequisites for capital formation and investments in plants and equipment.

Although TQM and similar efforts are popularly associated with the private sector (Crosby 1979; Imai 1986; Juran 1988), elected and appointed officials have come to recognize that traditional, comprehensive, management-oriented productivity efforts alone may not lead to sufficient improvements in service quality as perceived by the public. According to Milakovich (1992), decades of improvements in public management have been insufficient, “despite the best intentions, the application of these [traditional] methods has not eliminated complaints of inefficient or ineffective services, wasted resources, or lack of responsiveness by public employees.” TQM, directed at public or private sector productivity improvement, is one of the reformulations of management theory (Hyde 1992). It is a theory-based improvement strategy that allows public managers to increase the capacity for agency-wide cooperation, responsiveness to customer needs, and process improvement. TQM is not, however, a new invention for the public sector. Rather, it is an innovative repackaging of several decades of public sector productivity improvement (see e.g., Holzer 1992; Hunt 1993; Washnis 1980). Although neither TQM nor quality improvement were terms generally found in the public sector literature as late as 1988, the 1990s witnessed an accelerated improvement and publication movement under this terminology (e.g., Boyne and Walker 2002; Connor 1997; Poister and Harris 1997). In many cases, what had been formerly productivity projects were redescribed as quality efforts.

There are many definitions of TQM. Cohen and Brand (1993: xi–xii) define TQM as follows:

- *Total* implies applying the search for quality to every aspect of work from identifying customer needs to aggressively evaluating whether the customer is satisfied.
- *Quality* means meeting and exceeding customer expectations.
- *Management* means developing and maintaining the organizational capacity to constantly improve quality.

Cohen and Brand argue that “the same principles of total quality management used in private industry are creating a quiet revolution in the public sector.... To improve quality of service, increase productivity, and reduce waste, more and more government managers—from Little Rock to Washington—are turning to TQM.” In fact, quality improvement has become a central goal for public services across the world (Pollitt and Bouckaert 2000). In the United States, TQM is used in many public organizations as one of many improvement strategies (Berman and West 1995; Chackerian and Mavima 2001). Although a meta-analysis finds that current evidences do not provide comprehensive support for the argument that TQM leads to organizational success (Boyne and Walker 2002), many researchers have documented the positive impact of TQM on organizational culture and service delivery (e.g., Poister and Harris 1997).

2. Problems: Procedural Rigidity and Privatization

Despite productivity and quality efforts such as TQM, laws and regulations that reduce management’s discretion and flexibility are, unfortunately, pervasive. An overemphasis on top-down oversight—for example, the laborious approval process for contracts or for hiring new staff—delays improvements and discourages capable vendors or job seekers from competing for public contracts or positions. Similarly, nationally funneled, locally administered programs require multiple sets of overseers to have their say. At each level, watchdogs win points for raising questions and obstacles in the public interest. Yet the sum of those hurdles is a failure to improve productivity. Unfortunately, the ethic for which they are rewarded may often be one of minimizing expenditures (no matter the loss of necessary services caused by unnecessary delays) rather than investing in or facilitating productive actions. It is also important to recognize the use-it-or-lose-it syndrome built into most public budgeting and financial management systems that discourages managers from saving resources through innovation or any other means.

A structural alternative to government—privatization—has gained momentum since the late 1980s. Privatization is a contemporary reincarnation of businesslike management. The term *privatization*, as it is commonly used, is actually a bifurcated concept (Donahue 1989; Rainey 1997; Wamsley and Zald 1973). One meaning of the term is the shift of government services to the private sector, establishing a direct relationship between the private provider and the private consumer. That shift may include the divestment or sale of government enterprises and assets; load shedding; and demonopolization of government services to allow private alternatives to emerge (Savas 1992). In these public-to-private shifts, privatization signifies moving services from government provision to a direct relationship between the service provider (a firm) and the consumer or client; the financial relationship is between the two as private parties, without a payment through government. No contract with the government entity is involved, although government may have a regulatory, policing, or indirect financing role.

In its alternative usage, privatization is contracting out or moving services from direct supply by government to an indirect relationship between the service provider (a firm acting on behalf of government as a formal contractor) and the consumer/client. The financial relationship is then between three parties: government as the conduit and monitor; the firm as the service provider; and the customer/client as the service recipient. The premise is that contractors are more innovative and frugal than government; they have greater incentives and fewer obstacles to delivering services.

Touted regularly by politicians and emphasized by the media, it may now be the most popular argument for public sector productivity improvement. Their logic is that contracting out or turning over services to the private sector produces large savings with virtually no loss of quality or reduction in service levels (Savas 1992). Advocates hold that privatization can deliver a much greater portion of services that are now public. But skeptics hold that many services are necessarily government’s responsibility, and a public-to-private shift will not automatically enhance productivity in a jurisdiction or department (Barnekov and Raffel 1992). A recurring theme in the privatization literature is that what makes a difference is competition, not the fact of

privatization by itself, and that private monopolies are no better than the public ones (e.g., Donahue 1989). Therefore, privatization is productive as long as it assumes competition.

3. Opportunities: Cooperative Partnerships

While the competition on which privatization is based is certainly an important opportunity for improvement, cooperation is also an essential productivity enhancement strategy that is overlooked. Cooperative arrangements of service provision today may be a more accurate characterization of emerging day-to-day relationships. Joint public–private initiatives are options that innovative public officials often turn to. Rather than privatizing, raising taxes, or soliciting donations for visible projects (i.e., tax supplements), these new relationships are joint problem-solving efforts that may be initiated by either side. Cooperation between labor and management, different public agencies, neighboring local governments, government and voluntary organizations, executive and legislative branches, or governmental entities of different levels have proven to be effective arrangements aimed at improving government service and cutting costs. The ability to think and act outside the rigid but familiar bureaucratic box can be essential for pooling resources and improving productivity in an increasingly resource-scarce atmosphere. There are many successful cases of partnerships—public and private—between labor and management, between different public organizations, etc. (Holzer and Gabrielian 1996).

According to Fosler and Berger (1982), “local initiative supported by a strong civic foundation can give a community the ability to mobilize its public and private resources to improve community conditions.” Typically, joint public–private ventures strengthen government’s capacity to deliver services by

- Providing personnel or equipment donations
- Supplementing services such as schools, parks, and libraries
- Jointly developing strategies to ameliorate emerging problems such as homelessness or crime
- Stimulating economic development

Private partners will generally expect their investment to provide some indirect return such as a better-educated labor force or a safer neighborhood to do business in. But the private partner may also begin to act as a public-serving institution, directly investing for the general public good rather than for any specific, short-term, bottom-line gain.

4. Actions: Competency

Competition and cooperation may be productive concepts, but only to the extent that the public sector workforce is competently trained. In many governments, on-the-job training is still considered sufficient preparation for public sector responsibilities. Governments suffer from the assumption that the duties of public office are so simple that anyone can perform them. If public management responsibilities were once that simple, they are no longer. In an industrial and now post-industrial society, on-the-job training is insufficient preparation for increasingly complex public (and private) sector responsibilities. Yet the management of many public organizations is entrusted to amateurs with virtually no professional management training other than on the job. These situations create managerially illiterate politicians and political appointees as well as professionals with technical, not management, expertise. Too many people who manage public agencies have inadequate management skills, especially at the higher policy levels. Elected executives may be sensitive to the political dimension of public management, but they may not have an appreciation for management methods or personnel and budget systems. A political connection may mean that the appointee is devoid of any training other than experienced political sensitivity.

Political appointees may supervise professionals, but they may have far fewer or no professional credentials.

In terms of program effectiveness, a similar model would be Syracuse's model of government management capacity that is viewed as the black box linking inputs and outputs or outcomes. Ingraham and Donahue (2000) outline a framework: the inputs include policy design, political commitment, and resources; the outputs and outcomes include government performance and policy outcomes; they are linked by management capacity and implementation technology; all are affected by environmental contingencies. They call for the use of managing for results to integrate financial management, human resource management, capital management, and information technology management that is influenced by exercise of leadership, use of information, and allocation of resources.

In the literature and in the classroom, old, casual assumptions to the validity of on-the-job training are superseded by an appreciation for the complexity of managerial skills, the trained competence necessary to the management of public services, and the managerial differences in initiating, maintaining, and controlling systems. In search of more productive approaches, both sectors have complemented good intentions with good insights: technical approaches used by other organizations; enlightened leadership grounded in the social and psychological realities of groups and individuals; and comprehensive management systems drawn from other public and private sector organizations.

As a profession, public administration/management has a well-defined body of knowledge to draw upon. At least four dozen comprehensive handbooks on public administration provide guidance on such topics as improving accountability, reforming bureaucracies, managing information, enhancing communications, implementing strategic management, managing financial and human resources, improving labor relations, and increasing productivity. Just one series of bibliographies annotates over five thousand publications which are pertinent to the delivery of public services (Bowman 1980–1995), highlighting such problems as: equal employment opportunity, ethics, professional dissent, civil service reform, political corruption, the media and public opinion, public policy analysis, pay inequity, and the turbulence of gubernatorial and Presidential transitions. The unique problems of managing the public sector are critiqued in hundreds of periodicals.

VII. CONCLUSION

The five ideas outlined in this chapter are valuable theoretical lenses through which the dynamics of public administration can be observed. Public administration students use them continuously in theorizing and reflection, either consciously or unconsciously. This chapter concludes by illustrating how the popular reinvention literature can be analyzed with the five ideas, considering that the re-inventing government (Osborne and Gaebler 1992) and the National Performance Review (NPR), as well as the more general terms such as the New Public Management and New Managerialism, have gained much currency in public administration.

The reinventing government paradigm provides an eclectic synthesis of different approaches. Its ten tenets state that government should be: steering rather than rowing; community owned; competitive; mission driven; result oriented; customer driven; enterprising; anticipatory; decentralized; and market oriented. These tenets are in line with the New Public Management that promotes downsizing, reengineering, continuous improvement, privatization, contracting out, decentralization, deregulation, empowerment, marketization, and entrepreneurship. These elements are not new to the field of public administration; therefore, some commentators have argued that the NPM and reinventing government are old wine in new bottles. It is far from a new invention.

The NPM and NPR share a businesslike orientation with Idea One. The NPR clearly resuscitated the politics administration as its basis: "this performance review is not about politics.... We want to make improving the way government does business a permanent part of how government

works, regardless of which party is in power” (NPR 1993, iv). Their rationale is borrowed from public choice theories and neoinstitutional economics. Based on Savas (1987), distinction between types of goods (private, toll, common, and collective) and types of service arrangements (government service, government vending, intergovernmental agreement, contracts, franchises, grants, vouchers, market systems, voluntary service, and self-service), and his criteria for choosing best mode of service arrangement, Osborne and Gaebler (1992) propose a framework for tasks that are best suited for different sectors. They argue that the tasks best suited for the public sector are policy management, regulation, enforcement of equity, prevention of discrimination, prevention for exploitation, and promotion of social cohesion. The tasks best suited for the private sector include economic and investment tasks, profit generation, and promotion of self-sufficiency. The tasks more appropriate for the third sector are social tasks: tasks requiring volunteer labor, generating little profit, promoting individual responsibility, promoting community, and promoting commitment to the welfare of others. This typology is abstract and vague, because almost every endeavor the government pursues has multiple goals, and terms such as *economic tasks* are too broad. Unlike the Progressive reformers who were pro-government, most of the NPM and NPR advocates hold a government-bashing ideology (Carroll and Lynn 1996; Frederickson 1996). Progressives intend to borrow business practices to strengthen government, yet NPM and NPR advocates aim to expand markets and shrink government.

Some elements of the NPM and NPR can be found in Ideas Two, Four, and Five. They share a focus on efficiency, economy, and effectiveness with Idea Two. The idea of re-engineering, although touted as a revolution against Taylorism, has much continuity with scientific management: both study and reform organizational processes in a scientific way to achieve the greatest efficiency and cooperation. But they have different democratic meanings. The classic management models treat bureaucracies as closed systems in the sense that bureaucracies and bureaucrats cannot formulate their own goals because they should be controlled by political leaders. Therefore, hierarchical control is the major accountability assurance. In contrast, the NPM and NPR consider bureaucracies as open systems that should be more autonomous and independent from Congressional control. Outcome accountability is offered as a replacement to a traditional procedural accountability system, but its effectiveness is highly questionable, especially in contracting-out situations. Rosenbloom (2001) concludes that the reinvention movement “is older than it knows” (163), sharing many common elements with Wilson and Brownlow. The terminological similarities between the NPR (NPM) and Ideas Four and Five are also evident. For example, continuous improvement, one of the major proposals of the NPR, could be viewed as an incarnation of the human relations school (Theories Y and Z) and TQM. The NPR discussed participative management, intrinsic motivation, employee empowerment, bottom-up reform, and communitarian values, which are related to Ideas Four and Five. However, these elements should not be understood as substantive reforms; rather, they constitute a postmodern type of symbolic politics (Fox 1996): a metaphorical category is introduced (rowing and steering), good managerial terms are assembled rhetorically, and anecdotal evidence and examples are gathered as support.

The major critique of the NPR comes from scholars who hold Idea Three’s view in one form or another. Wilson (1994) contends that the most striking feature of the NPR is the absence of reference to democratic accountability. Moe (1994) criticizes the NPR on the institutionalist grounds that it disregards the public law foundation of public administration and endangers the accountability process in government. Rosenbloom views the key reinvention literature as “deeply flawed” and advances “no connection between their prescriptions and more effective representative democracy” (Rosenbloom 2001, 164). With an anti-bureaucratic ideological connotation (Frederickson 1996), the NPR was less responsive to democratic values than the traditional ideas (Ricucci 2001). The political objective of the NPR was to change the balance of power, control, and authority over the federal government with the constitutional doctrine of separation of powers giving way to absolute executive power over Congress (Carroll 1995). Carroll (1995) concludes, “In treating government as a Wal-Mart, the NPR ignored the fact that many operational

assumptions based on customer service had implications for broader systems of values such as the rule of law, representative government, separated and shared powers, and individual liberty” (310). As advocates of Idea Three criticize Ideas One and Two, Rosenbloom (1993) notes that the problem of the NPR is it ignored the old lesson “if we want better government, we better talk politics” (506). Government and administrative agencies cannot be reformed alone as entrepreneurial organizations, given legislative self-interest.

In reviewing the reinvention literature, society must look back to prevent those vague, anti-, or pseudo-democratic ideas from gaining currency in public administration (Lynn 2001; Rosenbloom 2001). Public administration is an actively evolving field that tries to adapt to and reflect upon a constantly changing, complex web of relationships of interactions between government and society. Theoretical frameworks, such as the NPR (NPM), no matter how comprehensive and insightful they may appear, are always incomplete. First, in a democratic society, the role of government will always be a matter of heated public debate. Second, there will always be new developments in the society that the discipline of public administration will try to respond and incorporate. With increasing international cooperation and a trend toward globalization of world governance, international and comparative administration may experience a revival. The welfare state may narrow the scope of services or ration them more carefully by outsourcing and privatizing them. With awareness of new hazards from some type of industries, the regulatory activities of the state may increase. With adoption of term limits, iron triangles will definitely be altered (perhaps still as triangles, but not of iron; perhaps still of iron, but more than triangles). With critical approaches gaining more momentum in mainstream social thought, public administrators may lean toward more participatory approaches in addressing public issues. All of these, as well as a variety of others, sometimes totally surprising, developments may occur. To predict the future is an ungrateful task, but at least one thing can be predicted with confidence—changes in general will definitely happen. Public administration has always proved to be flexible and vital so as to incorporate diverse streams of social thought into its realm, and it will do so in the future. Public sector administrators will continue to grapple with issues of citizen participation, professional responsibility, and efficient service delivery. And public administration will face the same old administrative questions that it faced yesterday and is facing today: Where does politics stop and administration begin? How can employees be led, motivated, and protected (from political excesses)? How different is public management from private management? What is the necessary scope of government’s services? What, and how much, should be centralized or decentralized? How can the public sector achieve efficiency and effectiveness while balancing those concerns with equity in service delivery? Who should govern, and what is the role of experts and expertise in the process of governance? What is the nature of public interest, if there is one?

This chapter builds around a metaphor, and adds to the substance of a contribution to an earlier edition of this work (Rabin et al. 1998, 103–115). The title here thus emphasizes this extension in the term “further toward” the organization sciences, which essentially appears in the last section of this essay.

The metaphorical story regarding rules of thumb about getting things done in public administration may be apocryphal, but perhaps not. The task there involved estimating the new year’s crop of Chinese ring neck pheasants on the midwestern plains, and a convenient approach proved serviceable. Enumeration followed a trigger event: when the corn crop in selected fields grew to

about a foot in height, and when pheasants went about their new happy hunting ground harvesting insects drawn to the growing corn. Economical and reasonably accurate assessments of the new population of growing birds were possible, given a certain timeline and some ingenuity. The critical period did not last long. The rising corn plants would soon hide all easily observable traces of the pheasants.

True or not, this metaphor—of the pheasant heads highlighted against a green background during the brief interval of moving from sprouts to corn-bearing stalks—focuses this essay, which highlights several trends in the development of the organizational sciences. In addition, here note only that organizational sciences (OS) is a label convenient for present purposes, and roughly relates to the analytical arena encompassed by three conventional labels: organization behavior, organization theory, and organization development.

I. SIX TRENDS AND TOPICS

To begin highlighting the key metaphor, six trends/topics in the development of the OS encompass any analysis, and this sextet may be considered as an analogue of the heads in the underlying metaphors, birds moving against the background of the growing cornfield that represents OS. More specificity may be in order.

Since World War II, especially, the simple and sovereign structure (SSS) has been specific (e.g. Simon 1946), and despite that worldview losing significant ground, it nonetheless often still remains in place, if uneasily. For example, my best estimate was that OS was stuck (e.g. Golembiewski 1986), while other voices despaired that OS was rather more a tangled jungle (e.g. Koontz 1961) than farmland ready to burst forth with fruit. Both views come to the same bottom line.

Whether one inclines toward stuckness or jungle, however, choices have to be made. What is to be nurtured, and what is to be weeded out lest it merely crowd out the more fruitful?

Now, then, seems like a good time to have a look at OS to check for heads above the conceptual crowd. A sense of that will be useful, and perhaps never more than today.

Which OS approaches have special promise in loosening the stuckness or taming the jungle? Let me emphasize six trends, even as I acknowledge several caveats; the formidable challenges implied two limits—the appreciable tentativeness appropriate to the future detailed development of these promising candidates, and the highly arbitrary focus on six candidates. Here, your commentator cannot even take refuge in the dodge illustrated by an Audi automobile commercial attempting to explain why the then-new model had five cylinders. “Six was too many,” a precise Teutonic engineer soothed the viewer, “and four cylinders were too few.”

Such concerns deter but they do not force a detour. In sum, six reasonable candidates for enhancing OS’s cost/benefit ratio include:

- Simple and sovereign structure (SSS)
- Environmental and technological contingencies that moderate SSS applications
- Strategy = structural contingencies, divisional model
- Horizontal approaches to structuring organizations
- Organization development and change
- A primer on methodology

II. SIMPLE AND SOVEREIGN STRUCTURE

To begin, real progress will depend on taking a giant step backward. As with real cornfields, what one sees depends on when one looks. Going back in time less than a quarter century or so, the OS often were seen as an analogue of the well-tended lawn: uniform, and governed by quite direct

FIGURE 3.1 A skeletal bureaucratic structure in government.

principles which might not yet be fully known, but were nonetheless knowable, and in any case were universally applicable. Thus, Fayol in 1916 wrote of “acknowledged truths” that are “flexible and capable of adaptation to every need,” and his orientation stuck in people’s minds, more rather than less. The key to application was in the confidence of the applier, rather than in the sensitivity of the purported truths to changing environments. As Fayol notes: “It is a matter of knowing how to make use of [these acknowledged truths], which is a difficult art requiring intelligence, experience, decisions and proportion” (quoted in Shafritz and Ott 1992, 56).

The basic product of this worldview might well be called SSS, and it appears in starkest form in the bureaucratic model. Bureaucracies look like the structure in Figure 3.1 (Carew et al. 1977), to simplify a bit by not differentiating line and staff (Golembiewski 1967). Put into words, such traditional structures emphasize:

- Departmentalization around the parts of work—typically called functions at top levels.
- The aggregation of like activities into departments or work units.
- Vertical relationships of authority and responsibility to induce the required integration between units.
- Narrow control and, if necessary, coercion in authority/responsibility linkages.
- Narrow spans of control (i.e., few individuals report to a single authority figure) and hence such organizations get tall as they grow in size, and quickly.
- Close replicas of SSS spread almost everywhere, and in a brief period of time (Jacoby 1973).

III. ENVIRONMENTAL AND TECHNOLOGICAL CONTINGENCIES

At least three clusters of observers cast doubt on the SSS by emphasizing differences in environments and technologies, with a clear general point in mind. If environments and technologies do differ, in brief overview, then different structures seem more appropriate than a single structure. That is, multiple structures increase the possibility of a good fit, or even a better fit with changing contexts.

The focus here will be direct, and even elemental. The three exemplars below could be fitted within the confines of the organization ecology approach to OS, and with plenty of room left to spare (e.g., Cameron et al. 1988). Organization ecology covers a vast range—from simple notions that organizations go through elemental birth–death stages of development (e.g., Bernstein 1955)

to subtle theoretical and even metaphysical treatments (e.g., Kaufman 1985, 1991). That range would overwhelm this essay, and constitutes a place where readers motivated by this essay might go next for greater attention to environmental and technological contingencies.

Simplicity, however, remains paramount in the current discussion.

A. ENVIRONMENTAL TURBULENCE VERSUS PLACIDITY

One direct but useful way to conceive of good fit possibilities focuses on the causal texture: stripped to essentials, environments clearly can differ in what might be called their “velocity of change” (Emery and Trist 1965). If so, mechanistic structures like the bureaucratic model seem more appropriate for low velocities, while organic structures have a greater affinity for high velocities of change facing an organization. In academic lingo, high-velocity environments usually are labeled turbulent.

The underlying rationale for relating structures to the environments surrounding them is quite straightforward. Think of a broken clock, which is clearly out of close synchronization with its environment. That clock nonetheless will provide the exact time twice during each day, as well as close approximations of the correct time at several positions clustered around those two points. But that constitutes a poor fit, as well as a bad bet, except for very limited purposes.

B. GENERIC TECHNOLOGIES

Technologies clearly differ, and this fact also challenges the sense of a SSS.

To elaborate a bit on the present point, consider the two dimensions in Figure 3.2: the variability of problems encountered in organizations, and the character of the search procedures associated with each of them. They generate four basic kinds of organizational missions to which different structures would seek good fits. For example, bureaucratic structures seem to fit best with Mission III.

Similarly, Woodward (1958) distinguishes three other kinds of technologies: crafts, large batches of identical end-items, and continuous processes. She also provides empirical data about associated differences in structural and managerial features. For example, bureaucratic structures would be less well adapted—if for different reasons—to crafts and to continuous processes than to large batch technologies. Why? Simply, reliance on crafts implies self-discipline by the

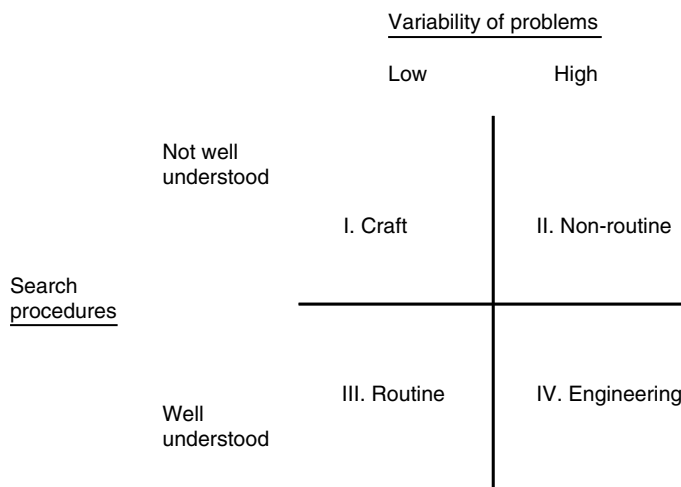

FIGURE 3.2 Four classes of organizational missions.

craftspersons and decreases the need for tall bureaucratic hierarchies. For continuous processes, the bureaucratic model also provides a poor fit because that model focuses on the components of work, when a holistic emphasis is far more appropriate for continuous processes like oil refining. The latter falls in cell IV of Figure 3.2, to be specific.

C. ENVIRONMENTS AND TECHNOLOGIES

Other students (e.g., Lawrence and Lorsch 1967; Lawrence and Dyer 1983) have proposed good-fit models that relate to both environmental and technological features. Broadly, they propose that all organizations have to balance two basic tendencies:

1. Toward *differentiation*, which refers to the differences between an organization's functional departments—differences relating to both cognitive and emotional orientations.
2. Toward *integration*, which refers to the unity of effort required, between as well as within departments, by the demands of the environments within which their organization operates. Environments encompass differences in markets, product lines, technologies, and so on.

In short, bureaucratic structures are based on the differentiation of separate functions, which facilitates narrow control and specialization but also exacerbates cognitive and emotional differences between specialists and the separate units into which they are departmentalized, from the very top to the bottom. This is tolerable—perhaps even necessary—in environments such as the cardboard carton industry characterized by well-known technologies, low rates of innovation, simple product lines, and long reaction times. Moreover, operations will tend to have shorter times of development. More or less, such differences can be accommodated by various simple integrative mechanisms, in a basic bureaucratic model, given stable technology and a simple product line.

On the other hand, bureaucratic structures constitute a poor fit with other environments and technologies, and sooner or later, the costs of SSS begin to outweigh the benefits. For example, the plastics industry requires a high degree of integration of complex chains of functions based on advanced and changing technologies. Here, the heightening of differentiation by the bureaucratic model wrong-headedly impedes the higher degree of required integration.

IV. STRATEGY=STRUCTURE CONTINGENCIES

A. DIVISIONAL MODEL

It soon became commonly clear that absent change of bureaucratic structures in advanced technologies matters would trend from bad to worse, and fast. In the early 1900s in a few businesses, and perhaps a half-century later in the federal government, environmental and technological demands evolved to the point that a new organizing strategy became widely perceived as appropriate.

There are many ways to illustrate this new strategy, and Table 3.1 depicts a convenient one. Broadly, organizations could adopt one of several strategies for growth, more or less in the order given. The most direct strategy, expanding volume at a central site, permits some organizations to grow to very substantial sizes with minimal organizational complications, but only as long as technological change is slow paced and product lines limited. This situation is reflected in the inherent wisdom of Henry Ford's dictum: "You can have any kind of a Ford that you like, as long as it's a black Model T." The bureaucratic model dominated, and with reasonable fit, when the first strategy for growth dominated.

TABLE 3.1
Strategies for Growth

- Expand volume at a central site
- Add field units
- Add functions and activities
- Diversity products and product lines

Source: Based on from Chandler, *Strategy and Structure*, MIT Press, Cambridge, MA, 1962. With permission.

Complications set in with more advanced strategies for growth, however, and especially so for diversification. And then the wisdom of Ford’s insight became his downfall. He could still make Model T’s cheaply and expeditiously, but he simply could not sell enough of them. In a few words, the automobile market reflected consumer demands for sophisticated wants and needs. Hence, for Ford as well as for a large number of organizations, the choice became clear: structurally adapt, or wither and die.

The detailed story has been told well, especially by Chandler (1962), so we can be satisfied with a bare sketch of the basic structural adaptation—commonly called the divisional model at high levels of organization. Analogs also apply at medium and low levels (Golembiewski 1994).

Generally, business adaptations came earlier and far outnumbered those in government. We can illustrate the genre with the late 1970s post-bureaucratic version of the New York State organization whose earlier bureaucratic structure fits Figure 3.1. Figure 3.3 depicts the basic structural change, conveniently omitting details that would burden this narrative more than enlighten it.

Rationales for the structural change from Figure 3.1 to Figure 3.3 vary in many details, but they share some dominant features. To illustrate briefly, the focus in Figure 3.3 shifts from the parts of the task to the whole—from the several activities to the holistic care of specific clients; hence the basic structuring around teams in Figure 3.3, as contrasted with separate functions in Figure 3.1. In effect, each Youth Service Team (YST) there now encompasses enough of the activities to be held

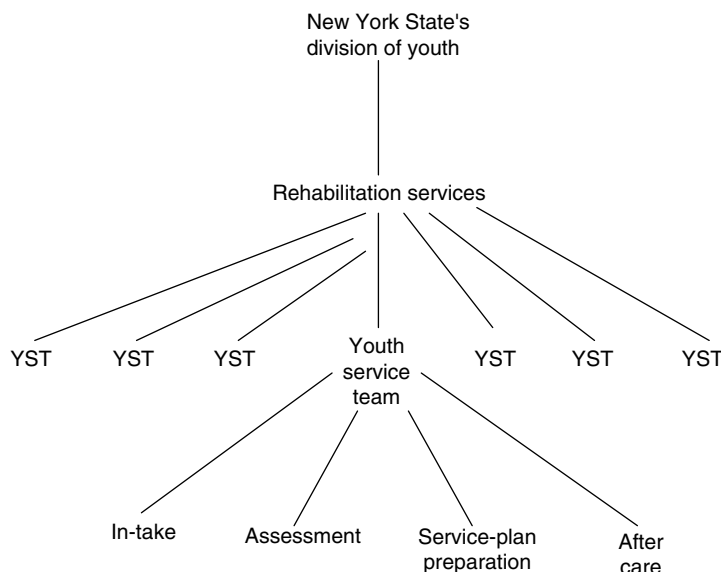

FIGURE 3.3 A divisional structure in government.

responsible for a specific cohort of clients. Some Figure 3.1 activities are reserved for assignment to overhead supervision, in part to facilitate oversight but also because of convenience.

Even these few structural details suggest some central tendencies in opposition. In Figure 3.1, if something goes wrong for a particular client, finger-pointing by the several activities is common, is moreover often necessary to maintain political leverage, and perhaps is even appropriate. “What we did was right,” the associated defensiveness would go, “but *they* messed up the client.” More broadly, in Figure 3.3, various opportunities to compare the several YSTs become available—for example, recidivism rates of the several cohorts of clients. This structural feature helps target responsibility and also encourages resolution of any conflicts within each YST, as contrasted with tension between units with specialized functions. This difference in tendency often can induce a significant difference in kind. It constitutes the difference between dealing with a “dead cat”—that is, any problem—in one’s own yard, as contrasted with the temptation to toss that problem into the backyard of other functional specialists, as the bureaucratic model often tempts one to do.

Space does not permit detailing the whole story, of course, nor is the divisional experience all of a piece. Details are available elsewhere (e.g., Golembiewski 1995a, chaps. 7–9), both about the advantages of the divisional model, as well as about some surprises that have characterized experience with the innovation, especially in business.

Here, let us take the easy way out. Five features of the divisional model contrast both subtly and sharply with the words attached to Figure 3.1. In sum, the structures in Figure 3.3 emphasize:

- Departmentalizing around the whole, around the needs of clients.
- The aggregation of related activities, that is, those required for some complete flow of work.
- Integration via the horizontal relationships of those contributing to a common flow of work, with vertical relationships still being maintained.
- Self-control and self-discipline of members of each basic unit—that is, every YST in Figure 3.3.
- A possibly very wide span of control, due to ease in assessing performance; such organizations can be flat, even if very large. Usefully, circumstances there also can encourage a narrow span of control, as start-up or when inexperience prevails.

V. STRUCTURAL CONTINGENCIES: ALTERNATIVE MODELS

Alternative models for organizing that extend far beyond the bureaucratic and divisional structures also hold major promise for moving OS in public administration beyond the present stuckness. For example, only confusion can be expected in panels of studies that do not differentiate kinds of organizations. Absent a great deal of good fortune, undifferentiated studies are likely to generate conflicting results; relationships that exist in bureaucratic structures, for example, probably will not exist in divisional models. And there may well be several varieties of each of the two basic models.

Nevertheless, the OS literature typically does not differentiate types of organizations, and consequently, research findings often are unfocused, if not outright muddled. Typically, in effect, the OS literature risks comparing proverbial apples with oranges or even watermelons. Hence the probability of stuckness is high because the units in research can differ in many relevant particulars.

Essentially, only a substantially complete taxonomy or typology of organizations will get us out of this self-imposed analytic hole (e.g., Golembiewski 1987). This taxonomic progress is not only Hydra-headed, but also exists in diverse stages of in-process development (e.g., Selznick 1957; Worthy 1958). Four varieties of this work on structural contingencies are briefly reviewed below, with each being labeled a treatment.

A. ANALYTIC OR SYNTHETIC TREATMENTS

The longest-lived approach to structural contingencies seeks to extract alternative structural models from the rich but amorphous descriptive literature, as well as from more rigorous but narrowly focused empirical studies, both in the field and in laboratories. Basically, such analytic or synthetic efforts seek to highlight alternative structural forms and to emphasize their strengths and weaknesses. Therefore, it is difficult to say much of substance about the literature on organization types without detailed qualifications, but perhaps an attempt is nonetheless warranted.

Basically, such efforts point out the inadequacy of any simple and sovereign approach to organization design. Organization worlds are complex and turbulent, and organization structures could hardly be monolithic.

However, no agreement has been reached about a necessary and sufficient list of the basic alternative structures, or about the variables in terms of which organizations should be differentiated. Thus, the National Organizations Study (Spaeth and O'Rourke 1994) of US "work establishments" isolated five configurations, two being variations on "simple structure" and three being varieties of bureaucracy (Marsden et al., 1994). Relatedly, Golembiewski (1987) distinguishes three basic structural models as well as several subtypes, and tends to focus on contrasts/comparisons between two of them. In contrast, Mintzberg (1989) focuses on a growing family of models. In a recent form, his list included:

- The entrepreneurial structure, which revolves around a charismatic central person who directly supervises an organization with little middle management or staff services.
- The machine bureaucracy, much like Figure 3.1 but tailored to industrial or thing making contexts, with large staff services, and many hierarchical levels.
- Professional bureaucracy, much like Figure 3.1 but with the addition of complex staff and professional services.
- The diversified or divisional form on the order of Figure 3.3.
- The professional organization, in which professionals work with substantial vigor and degrees of autonomy, ideally with standards for guiding behavior.
- The innovative organization or "ad hococracy", which means what it says: structures are often temporary, sparse, as well as spontaneous, and evolve for very specific purposes.

B. STATISTICAL TREATMENTS

Powerful statistical treatments permit judgments about the number of types of organizations necessary to account for the differences and similarities within any populations of establishments. For example, the National Organizations Study (Spaeth and O'Rourke 1994) of U.S. work organizations isolated five statistically isolated configurations in their preliminary taxonomy, with two being variations on SSS and three being variants of somewhat differentiated bureaucracies (Marsden et al., 1994). Other students using similar methods isolated much larger typologies (Miller and Friessen 1984).

This integrative approach is most highly developed for differentiating individuals. That is, detailed analysis of biographical differences and similarities between people implies that more than twenty subgroups are statistically required to provide a serviceable taxonomy of people (e.g., Stokes et al., 1994). Early rounds of analysis focus on the stability of such subgroups for different populations as well as for different kinds of biographical information. Subsequent rounds of analysis can determine how such subgroups relate to numerous variables of interest: performance in schools or at work (e.g., Golembiewski 1977), or numerous behavioral and attitudinal measures. In the long run, analytic energy and intelligence may succeed in characterizing subgroups in terms of variegated clusters of marker variables. Later, such research may develop labels that identify content-filled units of a more than statistical typology.

Organizational science researchers have suggestively but infrequently explored the promise of such statistical approaches, as in the useful work with organizational archetypes (e.g., Miller and Friessen 1984). This original work focuses on business firms, but the general principles apply broadly. Powerful statistical analysis of thirty-one variables concerning eighty-one organizations suggests that at least ten archetypes are necessary to encompass the full panel of differences or similarities measured. To illustrate, the archetypes describing a firm's condition include the impulsive firm, the stagnant bureaucracy, as well as the adaptive firm in a very challenging environment. In sum, archetypes seek holistic distinctions within a batch of organizations, as contrasted with focusing on covariation with one or more variables. The trap to be avoided is obvious, although the goal is far from an easy piece. Focusing on a few differences or similarities typically leaves many features free to vary in unknown ways, and this makes interpretations of findings dependent on the unlikely condition that all other things are more or less equal.

Clearly, generalizations about one organizational archetype would apply poorly, or not at all, to some or all of the others. Miller and Friessen highlight this central point by isolating nine different transitions that various archetypal firms might go through in moving beyond some original archetypal position.

The recent National Organizations Study at once builds upon and beyond the initial work with archetypes (e.g., Marsden et al., 1994). The study also relies on statistical analysis of eight variables—formalization, decentralization, vertical levels, and so on—to generate five structural configurations. These five basic types are then utilized in two basic ways: to test such proposed theoretical networks as that between size and measures of structure (e.g., Blau and Schoenherr 1971), and to test for differences among for-profit, public sector, and nonprofit organizations. Generally, large and small organizations differed on measures of structure, and contextual differences were associated with appreciable structural differences, even after controlling for differences in size and complexity between organizations (Marsden et al., 1994, 924–927).

C. CLINICAL TREATMENTS

A third approach to structural contingencies sees organizations as reflecting the characteristics of their elites or even more specifically, of their founder(s). The breadth of relevant literature is vast and grows steadily. Analytic targets often have been political figures—for example, how Hitler's powers and sexual perversions influenced the development of National Socialist cadres in World War II Germany (Waite 1977, 286–294), or how the personalities of public figures like Edgar Hoover (Powers 1987) profoundly impacted the character of the agencies that developed under their influences. Targets also have been businesspersons like Sam Walton, with observers relating his indefatigable ebullience to the commercial Wal-Mart empire, which he not only built but seems to be sustaining even from beyond the grave (e.g., Huey 1991).

These may be called clinical treatments, and are usefully illustrated by one exemplar that also combines some elements of a typology. Thus, Kets de Vries and Miller and Friessen (1984) propose that organizations tend to reflect the dominant emotionalities, or even pathologies of their founder(s) or dominant members. To illustrate, five basic kinds of neurotic organizations have received attention: the dynamic, the paranoid, the schizoid, the compulsive, and the depressive.

In effect, each type is singular: each has different advantages, and each type gets out of control in its own ways. In the case of the schizoid organization, trends in opposed directions can appear at the same time. This much seems reasonable enough; few generalizations will apply more or less equally to organizations of different neurotic types.

In summary, despite its numerous attractions in theory, the development of organization taxonomy remains rare. Most observers have been content to begin their analysis from the other end, as it were. That is, the all-but-universal practice takes this procedure: an analyst selects one or more variables, and (at best) tests for a few hypotheses in a convenient sample of organizations whose individual properties are neither specified nor known. In such an approach, absent great

fortune, no one can reasonably interpret results, given that no one really expects that generalization will occur across panels whose component organizations probably differ in many significant particulars, as this and the previous section suggests. Fortunately, a few exceptions indicate that greater explicit empirical attention to organizational taxonomies may well be in the future (e.g., Facer 2000).

VI. HORIZONTAL APPROACHES TO STRUCTURING ORGANIZATIONS

Another useful OS approach for special emphasis essentially replaces the vertical preoccupation of the bureaucratic model with a horizontal orientation to structuring work. For example, the divisional model retains vertical features such as up-and-down reporting relationships, but seeks to augment them with horizontal features in basic units for departmentalization. A comparison of Figure 3.1 and Figure 3.3 supports this point. The horizontal forces in Figure 3.3 include shared loyalties to, and responsibility for, the activities related to a total flow of work (e.g., each YST in Figure 3.3). The basic departments in a bureaucratic model, oppositely, tend to fragment such loyalties and responsibilities.

The horizontal orientation to structuring organizations has taken many forms, at both low levels as well as high, as Table 3.2 shows. Conveniently, the table adopts a here → there format to indicate the direction of vertical → horizontal shifts or changes. Here → there movements typically are ones of degree rather than all or none, but their combined effects can produce organizations starkly different from the bureaucratic model (e.g., Golembiewski and Kiepper 1988; Perkins et al. 1983).

TABLE 3.2
Some Developmental Tendencies in the Horizontal Structuring of Work

Features of Structures and Roles	Appropriate Behaviors and Attitudes
From particularistic activities or functions to holistic bundles of activities or functions required	From protection of narrowly specialized self-interests to enhanced performance on total flows of work, which requires appropriate cultures and values
From tall structures to flat structures with fewer levels	From focus on activities/functions to focus on customers or clients, whether internal to organization or external
From numerous narrowly specialized jobs to a much smaller number of integrative jobs (job enrichment)	From workers implementing detailed directions to a broad range of participation in making decisions within a broad context of missions/roles
From checks and controls by external units to growing reliance on internal checks and controls	From one size fits all to multiple ways of development for same/similar units in response to specific histories, mixes of personnel, etc.
From a bureaucratic monopoly to flow of work structures that can encompass numerous structural forms, including bureaucratic ones	From up-over-and-down communication, often languid, between narrowly specialized units in tall organizations to intense, flash communication within an integrative unit in flat structures
Roles transition from the controlled to the empowered, from those who control to those who empower	From competition to gain greater shares of resources to competition to reduce costs and raise quality, as facilitated by direct comparisons of several integrative units
Management orientations shift from the transactional (like scorekeeping structures in a bureaucracy) to the transformational, which involves appropriate cultural and normative changes in turbulent environments	From complicated and often political reconciliations of conflict between narrowly specialized units to straight forward reconciliations within integrative units

Table 3.2 seeks to illustrate a basic approach rather than to exhaust its details. Table 3.2 is largely self-explanatory, but remains incomplete in two major senses. Thus, the exemplars of vertical → horizontal shifts can be multiplied, and easily. In addition, a fuller development of the basic point would emphasize infrastructure involving politics, practices, and procedures, as well as structural patterns (e.g., Perkins et al., 1983).

A. ORGANIZATION DEVELOPMENT AND CHANGE

Finally, if only for the present short list of approaches prominent in OS, what is here labeled organization development and change (ODC) has demonstrated substantial performance and also holds great promise. ODC has two basic forms, organization development (OD) and quality of working life (QWL). See work at the state level of government (e.g., Barzelay 1991), which complements nicely the synthesis of observers like Carnavale (2003). Other sources provide generic perspective (e.g., Golembiewski, 2003). Both forms have received fulsome attention in many places (e.g., Golembiewski 1995b), but here space permits descriptions of only three features.

B. ODC VALUES

Both OD and QWL rest on related sets of values whose shared thrust is toward greater need satisfaction in work that is intended to encourage greater commitment and higher performance at work. Organization development tends to emphasize the character and quality of the patterns of interaction at the worksite, although QWL tends to emphasize procedural and structural issues. Both approaches share basic values (e.g., Skelley 1989), which contrast sharply with those underlying bureaucratic forms. These differences include the high degrees of participation and involvement that QWL and especially OD seek.

C. ODC'S REACH

ODC applies to the full range of organization levels and activities. Thus, OD has more of an executive focus, in general, and QWL tends to emphasize operation levels; however, overlap does occur, and numerous prominent practitioners and theorists work both sides of the ODC street, as it were. In approximate order of their complexity and subtlety, ODC applications can be assigned to the following categories (Golembiewski 1990, 19–21):

- Process analysis, which involves the application of behavioral science theories and perspectives to diagnose complex and dynamic situations—interpersonal, in groups, and in systems of groups
- Skill-building consistent with ODC values, as in giving and receiving feedback, or in conflict resolution
- Diagnosis, which usually involves process analysis but can also rely on various other data-gathering and interpretive approaches, as via survey/feedback, sensing groups, or interviews
- Coaching or counseling, as in third-party conflict resolution
- Team building or development, which focuses on the efficiency and effectiveness of small task groups
- Inter-team building or development, which focuses on the relationships between two or more units in a broader system—for example, departments, projects, or task groups.
- Technostructural activities that seek to build need-satisfying roles, jobs, policies/procedures, and structures
- System renewal or system building, which has comprehensive goals in large systems relating to culture, values, and structures

Two or more of the categories may be employed in any single ODC application. Indeed, system renewal or system building typically includes complex combinations of all seven categories of activities in building toward ODC values. Relatedly, the last ODC category may have an operating time frame of 2 to 5 years, although applications of other categories can take only days or even hours.

D. ODC's GRASP

How successful were attempts to act on these levels? Substantial confidence is possible in estimating this grasp. In sum, success rates in both OD as well as QWL are substantial in both highly developed economies as well as in third-world settings (e.g., Golembiewski 1990, 11–43).

Evaluative studies support high success rates in aggregates of studies of several thousand cases (e.g., Golembiewski 2003). Generally, but not exclusively, the cases deal with applications in English-language studies of applications in approximately 65 countries.

The cautious observer will not assume that this newly available literature says it all, of course. Rather, the available evaluations of planned change applications differ in many particulars: the number of cases dealt with, measures of success, concern for methodological rigor, and so on. As a ballpark figure, estimates of success rates seldom fall below 50%, and usually cluster in the 70%-plus range. Success rates in third-world settings are a bit lower in all available cases (e.g., Golembiewski and Luo 1994), but even there the rates are attractive.

Without a doubt, much remains to be learned about ODC success rates, but evidence suggests that no big critical surprises are likely. For example, the basic criticism of ODC applications emphasizes that they usually rely on self-report measures, which some observers see as unreliable or as mere opinions. However, ODC also has high success rates when its effects are estimated in terms of objective reports or hard data—cost of production and waste, absenteeism, and so on (e.g., Nicholas 1982). Indeed, in one large batch of QWL studies (Golembiewski and Sun 1990), success rates were greater for hard data rather than for self-report data.

VII. GUIDES FOR EMPIRICAL ANALYSIS

The trends above cannot be allowed to find their own ways—as unguided missiles, as it were; hence the crucial relevance of a great and growing respect for adherence to guidelines for empirical analysis as they underlay useful theoretical progress. This theme reaches far beyond the present confines, of course, because some useful (even if limited) things can be said here. Two foci suffice to illustrate present purposes. First, OS will experience enhanced empirical development to the extent that it follows quite specific guidelines. Second, several varieties of this development will be signaled by reliance on distinct but related types of theoretical development.

A. CRITERIA FOR EMPIRICAL DEVELOPMENT

Progress in the development of OS as science will be no slam-dunk, to be sure, but practice from many arenas of inquiry provides some useful guidance. Table 3.3 provides a summary of these guides, with details being available elsewhere (Bozeman 1999, 221–235).

B. TYPES OF THEORETICAL DEVELOPMENT

Along with the guides in Table 3.3, and reasonable products of them, the successful development of OS in public administration will be sensitive to several kinds of theories, and not just because of fussiness. Directly, the failure to recognize and respect differences between types of theories often has proved troublesome in all areas of OS.

TABLE 3.3
Summary of Guides for Scientific Development in Public Administration

Development will be aided by ideational bases that:

- Relate directly to prevailing practical challenges facing public agencies, as sharply opposed in significant particulars to its developments as a satellite in (let us say) political science in the context of the basic politics vs. administrative distinction
- Avoid resolutions-by-definition
- Support the development of a field linking analysis and application
- Respect both task and maintenance aspects of a field, with the former relating to analytic issues and the latter relating to related-but-distinct issues such as loyalty to colleagues and respect of their approaches, however limiting
- Are tied to values external to public agencies, at constitutional, cultural, and organizational levels
- Frame useful attention to multiple organizational and analytical levels (individuals, interpersonal relationships, small groups, and large organizations)
- Take advantage of law of tactical convenience in prescribing reasonable next steps for both application and analysis
- Require and permit testing of empirical covariants, as well as the empirical consequences of value aspects, which open-system perspectives imply a self-correcting potential

Source: Adapted from Golembiewski, R. T., in *Public Management*, Bozeman, B., Ed., Gossey-Bass, San Francisco pp. 91–105, 1999. With permission.

Three types of theory get attention here, although their characters can only be illustrated, and even so, they constitute only a sampler. In outline form, these types include:

1. *Empirical theory:* This details that (for example) A is directly related to B and C under conditions x , y , and z . Great care must be given to conceptual and operational definition of all components, with the latter detailing valid and reliable ways of measuring proposed features of reality. Critically, as Table 3.3 proposes, empirical testing of hypothetical relationships is central to the development of theoretical fragments, and especially to their continuous extension to encompass broadening patches of the empirical world. Failure at such broadening implies inadequate foundations for inquiry—perhaps in conceptual definition, operational definition, or both. OS variants often neglected this central requirement, and assumptions were allowed to suffice as long as observers did not look too long or too hard.

Despite the obvious complexity of satisfying what amounts to tridimensional chess, one central point is crystal clear. Ultimately, there can be only one empirical theory relevant to organizations, but typically, there will be several fragments of empirical theory. These fragments are not only incomplete, but they may in practice be variously at odds with one another, and even contrary.

Awkwardly, OS variants typically propose that they are an empirical theory, as in Organization Theory. This was not only presumptuous, but also led to much wasted effort both in trying to uphold that assertion as well as deny it. Neither effort was determinative in empirical inquiry, but the former had more practical value than the latter.

2. *Goal-based, empirical theories:* In prototypic form, this type of theory proposes to develop propositions such as this one: if you want some specific desired or desirable conditions, you should induce conditions such as high A and low B. The section above on OD, ODC, and QWL illustrates examples of the reliance on goal-based, empirical theories. Thus, specific values are targeted, and ways to approach these normative states are detailed, hopefully with growing precision over time.

Obviously, there can be many goal-based, empirical theories, one theoretical variant for each set of goals. OS research caused much mischief by neglecting this crucial point.

Again, OS often neglects the testing of such sets of goals-and-approaches, with few exceptions, such as those sketched in the sections above on OD.

3. *Action theories*: This discussion may read so far as if those in OS encouraged us to sit around and wait for the grand breakthrough, which was at best unlikely. Not so. An important class of theoretical development involves action theories, which relate to systems of generalizations about how to attain specific values at specific locations, as is the case with such interventions as flexible workhours programs. These programs were initially applied to ease traffic congestion, and provided that employees begin and end work within some extended period, varying at their initiative on a daily basis—employees could either work the normal 8:00–5:00 h, or they could daily start and stop within limits at both ends of the total workday. These limited effects did tend to occur, but so did many others, e.g., heightened employee satisfaction, improved family relationships, and often even improved productivity (e.g., Golembiewski 2003, chap. 7). Theoretical knowledge of specifically when, where, and how flexible workhours will work is hardly complete, but it tends to work in almost every application and hence has spread broadly in both business and public settings.

Practically, good things happen with sufficient frequency to encourage reliance on the intervention, if with care to anticipate employee malingering which could terminate any program. At the same time, students see, to add to the list of factors positively affected by flexible workhour programs as well as to behavioral conditions and consequences.

Significantly, action theories can also have broadening uses. Specifically, detailed research on flexible work hours has isolated some fragments of goal-based, empirical theories, such as those related to participation, involvement, and empowerment. All of these have normative implications, of course.

Furthermore, consistent results with applications of action theories might also suggest the development of empirical theory fragments, or the linking of existing patches of theory, both of which in turn might also lead to useful developments. Thus, such developments might enhance novel goal-based, empirical theories. Moreover, even small fragments of empirical theory might be tested, if cautiously, by interventions at the level of action research.

VIII. IN-PROCESS CONCLUSION

This essay can be summarized in terms of two generalizations. To recall the early metaphor of pheasants in the cornfield, some attractive heads seem to be working their way through OS acres. Six exemplars get attention here, but more could qualify. Second, real progress in the development of PA is shown to depend upon certain guidelines which emphasize distinctions between kinds of theory development.

This essay will have achieved its highest purpose if readers gain a sense of the ways in which the first generalization applies, and also if they are motivated to employ the details of the second generalization via further reading and additional reflection of experience. Further additions to the second point are possible, but they remain objectives for a later time.

Public administration theorists have included scholars and practitioners with many different viewpoints and objectives. Most have drawn important material from the more general field of organization theory, though political theory has made important contributions as well. Indeed, as will be demonstrated near the end of this chapter, the question of whether or not a theory of public organization (bringing together organizational and political perspectives) is even possible must occupy some attention.

The first concern here, however, is to examine those developments in the field of organization theory that have been most relevant to the study of public administration. The approach here is to identify issues largely drawn from organization theory that have proven to be of interest to a wide variety of theorists and practitioners in public administration, issues that have been sources of continued controversy within the field of public administration, and issues that remain largely unresolved even today. The five great issues discussed in this chapter, each of which meets the three criteria just mentioned, are

- I. Politics and administration
- II. Bureaucracy and democracy
- III. Organization and management
- IV. Theory and practice
- V. Theories of public organization

I. POLITICS AND ADMINISTRATION

Though the dichotomy between politics and administration is unquestionably one of the oldest issues in the field of public administration, the relationship between politics and administration remains one of the most contemporary. Woodrow Wilson's (1887) essay is taken by most commentators as the first major work in public administration. In that essay, Wilson laid the

groundwork for the self-conscious study of public administration by pointing out the increasing difficulties faced by public agencies, saying, "It is getting harder to run a constitution than to frame one" (Wilson 1887, 200).

His solution was to operate the agencies of government on a businesslike basis, following accepted principles of management in the private sector and seeking the utmost in efficiency. But in Wilson's view, this could never be accomplished as long as public agencies were subject to the corrupting influence of politics. For this reason, Wilson made a distinction between politics and administration: in the political realm, issues of public policy were to be formulated; in the administrative realm, they were to be implemented. Wilson's dictum was clear: "Administration lies outside the proper sphere of politics. Administrative questions are not political questions. Although politics sets the tasks for administration, it should not be suffered to manipulate its offices" (Wilson 1887, 210).

Two important concerns are raised by Wilson's argument: one, the empirical question of whether politics and administration are (or can be) separated; the other the normative question of how to maintain the accountability of administrative agencies. The first of these questions was addressed at the turn of the century by Goodnow (1900), whose book, *Policy and Administration*, was (and is) taken by many to be a defense of the Wilsonian distinction between politics and administration. In fact, Goodnow's book argues that the formalistic separation of legislative and executive functions is often violated in practice. Though Goodnow holds that it is analytically possible to distinguish between the "expression" and the "execution" of the will of the state, he argues that these two functions cannot be clearly assigned to one branch of government or another.

Similar arguments were developed by other writers, including Appleby (1949), Gulick (1933), White (1936), and Willoughby (1936). All acknowledge the difficulty of separating politics (or policy) and administration, with both Gulick and White providing specific illustrations of the role of civil servants in developing policy, either through their exercise of discretion in carrying out policy or through their advice to policy makers. For example, Gulick (1933, 561) describes the work of the public employee as involving "a seamless web of discretion and action." Similarly, White (1936) notes the increasing "executive initiative in public policy," even arguing at one point that those who staff the bureaucracy may be in the best position to make recommendations free of political influence. In these ways, the dichotomy of politics and administration, if it ever existed in either theory or practice, was quickly eroded. Indeed, by the time of Appleby's writing, it had apparently disappeared. He said simply, "public administration is policy-making" (Appleby 1949, 170). More recently, Svava suggests that the politics-administration dichotomy "should be viewed as an aberration that departed from the ideas that preceded and followed it rather than defended and reinterpreted to make it relevant to current practice" (1998, 51). The more historically accurate recognition of the interdependent relationship between elected officials and administrators "leads to a model of complementarity rather than a dichotomy" (51).

One reason scholars began to assert more straightforwardly the involvement of bureaucrats in policy making was that bureaucrats were becoming involved in more policy making (Dunn 1994; Peters 1989; Ripley and Franklin 1986; Seidman and Gilmour 1986; Wildavsky 1987). Certainly, Wilson's work itself was encouraged by the fact that those staffing public agencies were no longer merely clerks, but were increasingly technicians and professionals from a variety of substantive backgrounds. That trend has continued as government in this country has grown and has become more and more complex. Those in public agencies are a source of expertise with respect to public policy matters and consequently are called on to present their ideas. Moreover, the scope and complexity of government today make it more difficult for the legislative branch to specify every detail of newly enacted policies. Consequently, there is increasing dependence on administrators throughout public agencies to exercise their discretion and to shape public policies as they see fit (Gilmour and Halley 1994; Stillman 1991, 1996). Indeed, Maass and Radway found "public policy is being formed as it is being executed, and it is being executed as it is being formed" (2001, 165).

The increasing role of the bureaucracy in public policy, however, does not make the question of politics and administration less difficult. If the bureaucracy is in policy making to stay, how can the public make sure that the policies arrived at are responsive to the public interest? How can the public ensure democratic accountability? Wilson's answer, and the answer of most early theorists in the emerging field of public administration, was that managers in public agencies should ultimately be accountable to the legislature, which is in turn accountable to the people, thus satisfying the requirement of democracy. In this hierarchical view of accountability, the separation of politics and administration is essential—the political neutrality of appointed officials must be preserved.

Many recent studies have indicated the difficulties with such a position (see Thompson 1983, 245). Bureaucrats not only exercise discretion and provide advice: they shape public opinion through the information they provide, mobilize support for their issues (and their agencies), and bargain with numerous groups both within and outside government to achieve their objectives. Under such circumstances, it is obviously difficult to speak of an adequate measure of accountability lying solely within the hierarchical relationship between the agency and the legislature (Lynn 1981; Thompson 1980, 1985).

For this reason, more contemporary discussions of responsiveness have cast the relationship between politics and administration in a new light: by what measures might society supplement hierarchical accountability so as to ensure a “correspondence between the decision of bureaucrats and the preferences of the community” (Rourke 1984, 4)? In general, the answers have taken two forms: the first seeking to instill a sense of subjective responsibility in those who staff public agencies, and the second seeking formal or objective mechanisms to ensure responsibility (Rosen 1998).

Hoping to develop a strong sense of responsibility on the part of civil servants, especially administrators, numerous writers through the decades have commented on those qualities they found desirable. Dimock (1936, 132) hoped for “loyalty, as well as honesty, enthusiasm, humility, and all the other attributes of character and conduct which contribute to effectual and satisfying service.” Appleby (1945, 4) spoke of “a special attitude of public responsibility.” Bailey (1966, 24) sought moral qualities of “(1) optimism, (2) courage, (3) fairness tempered by charity.”

Harmon's *Action Theory for Public Administration* (1981) uses an “active-social paradigm” to argue that public administration theory must address the relationship between substance and process and between individual and collective values. This leads to tension between hierarchical accountability and discretion. Harmon concludes in a later book, *Responsibility as Paradox* (1995), that responsibility is paradoxical. It involves the opposing ideas of moral agency, the individual's own sense of responsibility, and the accountability of institutional authority.

More recently, Dobel (1999, 21) builds a theoretical argument leading to the following commitments for public administrators:

- Be truthfully accountable to relevant authorities and publics
- Address the public values of the political regimes
- Build institutions and procedures to achieve goals
- Ensure fair and adequate participation of the relevant stakeholders
- Demand competent performance effectiveness in the execution of policy
- Work for efficiency in the operation of government
- Connect policy and program with self-interest of the public and stakeholders in such as way that the purposes are not subverted

Several efforts have been made to bring these rather abstract qualities into existence. One stream of thought, associated primarily with Friedrich (1972) and Mosher (1982), argues that the emergence of professionalism within the bureaucracy should aid in the establishment of a proper set of values among bureaucrats. Friedrich felt that professionals, whatever their technical area, were

likely to be more attuned to questions of administrative responsibility. Mosher focused more on those preparing specifically for administrative careers in government. As a part of their professional training, he argued, future administrators should be imbued with a sense of democratic responsibility. In Mosher's words, "the universities offer the best hope of making the professions safe for democracy" (Mosher 1982, 219).

Another stream of thought focuses on the kinds of commitments or oaths that are required of public servants. Many professional associations, including the American Society for Public Administration, have developed codes of ethics to which their members subscribe. Some, like the International City Management Association, have developed mechanisms for punishing violators of the code. Indeed, as Rohr (1989) points out, public employees take an oath to uphold the Constitution and, in his view, are therefore bound to support "regime values." These values can be determined best through a careful review of the interpretations given the Constitution by the Supreme Court (see also Rohr 1986). This position is elaborated upon in Rohr's more recent book, *Public Service, Ethics, and Constitutional Practice* (1998).

Other studies in public administration ethics have followed other paths. Cooper views "the citizenship role as an appropriate normative foundation for the public administration role" (1991, x) with both rights and obligations. The virtuous administrator forgoes self-interest for the common good. Later, Cooper (1998) describes the responsible administrator as "a juggler managing a multitude of competing obligations and values" (Cooper 1998, 244). Cooper discusses four levels of reflection and deliberation on ethical issues: the expressive level (the emotions), the level of moral rules (of the organization or policy), the level of ethical analysis, and the postethical level (addressing basic assumptions about human nature). Cutting across these are issues of responsible conduct and individual autonomy, all of which must be balanced or combined successfully in administrative action.

From a different perspective, Burke (1986) argues that bureaucrats must be made accountable to the society they serve, but that this can occur in several ways. Formal legal definitions of responsibility are desirable, but perhaps too tinged with obedience to hierarchy and the strict rule of law. Such definitions must be balanced with attention to the individual's sense of personal responsibility as that is developed through participation in a democratic society.

Finally, Denhardt (1988) seeks to balance a philosophical and practical approach to the ethics of public service. She defines administrative ethics as "a process of independently critiquing decision standards, based on core social values that can be discovered, within reasonable organizational boundaries that can be defined, subject to personal and professional accountability" (Denhardt 1988, 26). Her approach is one that emphasizes reflection and dialogue in making ethical decisions. In a later work (Denhardt 1994) she extends this idea to support the importance of character ethics in molding the administrator's role.

Others have found dependence on the ethical commitment on the individual administrator insufficient as a device to ensure responsiveness. Among these, Finer (1972) and Lowi (1979) have both argued for greater legislative detail and increased supervision of administrative activities as means of limiting the choices bureaucrats might make. Finer (1972, 238) stated his position in this way: "Are the servants of the public to decide their own course, or is their course of action to be decided by a body outside themselves?" Feeling that bureaucrats holding a minority opinion might force their view on an unsuspecting public, Finer argued for the latter; specifically that the legislature should engage in detailed consideration of its intent in formulating public policy and that it should exercise detailed supervision of the agencies of government.

Lowi (1979) argued from a quite different perspective, but came to a similar conclusion. His concern was the fact that certain agencies of government seemed to develop a special relationship with certain private interests, often the very interests they were designed to regulate. In such cases, the bureaucracy may exercise discretion to favor certain private interests to the neglect of the larger public interest. Lowi's solution, "juridical democracy," envisions more detailed legislative action combined with more complete administrative rule making, both designed to eliminate discretion

through the codification of as many relationships between agencies and their constituents as possible.

In addition to more specific legislation and greater legislative review of administrative actions, other suggestions designed to increase responsiveness have been proposed. Cooper (1998), for example, discussed the numerous roles, obligations, and objective responsibilities that provide boundaries for administrative action; Gawthrop (1984) explores the use of systems theory as a basis for redesigning organizational structures so as to fully incorporate ethical concerns. More recently, Gawthrop argues that administrators should focus “on the ethical-moral values and virtues that pervade the spirit of democracy and constitute the pathways of the common good” (1998, xii). These function as guideposts to public service.

Others have described various structural mechanisms that might be employed to ensure responsiveness on the part of administrators. Among these are devices such as sunshine and sunset laws, surveys of citizen opinion, administrative hearings, and ombudsman programs. However, the two proposals most widely discussed are representative bureaucracy and public participation in administrative decision-making. Proponents of representative bureaucracy argue that bureaucratic decisions are more likely to represent the general will of the people if government agencies are staffed in such a way as to reflect significant characteristics of the population. In its earliest applications, the notions of representative bureaucracy meant representation of various geographical constituencies (primarily the states) or, in its English version, the representation of social classes (Kingsley 1944). In more contemporary times, representative bureaucracy is more likely to refer to representation based on race or sex (Krislov 1974). Unfortunately, studies have shown mixed results in terms of responsiveness (Meier 1993).

Public participation, employed as a device to ensure correspondence between the actions of civil servants and the wishes of the people, has an equally long, if not longer, history; however, it was given special emphasis in the 1960s and 1970s. Especially in what was called the “New Public Administration” (Bellone 1980; Frederickson 1971, 1980; Marini 1971; Waldo 1971), the notion of public involvement was heralded. Through the creation of forums for citizen input ranging from open hearings to advisory boards to elected or appointed commissions, more information was sought from those likely to be affected by the decisions of the agency (see also King et al. 1998; King and Stivers 1998; Nalbandian 1999; Skocpol and Fiorina 1999).

Box (1998) outlined a model of “citizen governance” that moves citizens into the roles of creating and implementing policy. Bryson and Crosby (1992) developed a methodology for bringing together diverse groups willing to share power in the pursuit of common goals. In addition there have been a wide variety of experiences with participation and civic involvement, some initiated by government, others based in neighborhood citizen action (Barber 1992; Lappe and Du Bois 1994; Mathews 1994). In many cases, however, what appeared to be participation was better described as co-optation—“the process of absorbing new elements into the leadership or policy-determining structure or existence” (Selznick 1949, 13)—and many government agencies remain quite insulated from the public. The issue of public participation will be later addressed in the discussion of the “New Public Service.”

The questions of politics and administration clearly connect with concerns about the legitimacy of public administration, an idea pursued by a group of scholars from Virginia Tech in what was first termed “The Blacksburg Manifesto” and later published in book form (Wamsley et al. 1990). The Blacksburg viewpoint suggests that the legitimacy of public administration is in question, and only through a refounding of the field can its legitimacy be restored. Such a task requires attention to such wide-ranging issues as governance and citizenship, but centers on establishing what the authors call “an agency perspective.” While it remains unclear how this agency perspective is to restore legitimacy to the field, it is apparent that the authors wish to see the public bureaucracy move to a far more central role in the democratic system than is currently the case. Obviously, in such an effort, serious questions concerning politics and administration must be addressed.

Along similar lines, Stever (1988) has also called for increasing legitimacy for public organizations. In his view, "Public administration must appear to both elected officials and the public as a crucial function to the maintenance of society. Furthermore, the civil servant must achieve a certain mystique in the performance of these crucial functions" (Stever 1988, 175). While few would disagree that establishing such confidence in the public bureaucracy would help its legitimacy, how public administrators are to do that remains no clearer than before.

Why has the issue of politics versus administration continued to play a prominent role in discussions of public administration even today? At least three reasons come to mind. First, although the early writers on public administration did not argue for as strict a dichotomy of politics and administration as many people think, they did soon come to define their own subject matter in terms that seemed to imply such a distinction. By defining public administration as the work of government agencies (Willoughby 1927), these writers quickly abandoned the notion of public administration as a function occurring throughout government and pursued instead an institutional view of public administration occurring within a certain setting, the agency. The implication, of course, was that such a study could be developed independent of studies of legislative processes and that a distinction could be made between legislation and implementation, between politics and administration.

Second, the urging of Wilson and others for government agencies to pursue the kind of efficiency modeled in private industry required some distinction between politics and administration. In order for agencies to be efficient, they could not be contaminated by either the corruption or dishonesty that often crept into the political process or the concern for responsiveness that, it was felt, was the prerogative of the legislature. Moreover, the early writers, just as many today, wanted to operate government more like a business—although no one has ever been perfectly clear about what that means. The slogan, however, required then and requires today a separation.

Finally, questions about the proper relationship (not dichotomy) between politics and administration have continued simply because defining that relationship goes to the heart of what public administration is all about. If the governance and management of public organizations differ from others in society, that difference must lie in the proper role of such organizations in defining and responding to the public interest. As will be seen later, it is indeed the resulting tension, perhaps the inevitable tension between efficiency and responsiveness, that best characterizes work in public organizations.

II. BUREAUCRACY AND DEMOCRACY

As has been discussed, the question of how to reconcile a concern for efficiency with a concern for responsiveness was treated by many early writers simply in terms of legislative control. The logic seemed to be that once the responsiveness of the agency to legislative mandate was assured, the agency should concentrate on operating in the most efficient manner possible. It was natural, therefore, that the scholars and practitioners would be drawn to the best contemporary model for achieving organizational efficiency—the industrial or bureaucratic model. Therefore, despite the fact that this model had certain autocratic features considerably at odds with democratic theory, it became the standard for administrative management in the public sector.

This position, however, skirted the question of whether an administrative body organized on nondemocratic lines is consistent with the notion of a democratic society. Certainly there were many who felt there was little problem here. For example, Cleveland (1920, 15) wrote that "the difference between an autocracy and a democracy lies not in the administrative organization but in the absence or presence of a controlling electorate or representative body outside of the administration with power to determine the will of the membership and to enforce its will on the administration." On the other hand, there were many who argued, "a democratic state must be not only based on democratic principles but also democratically administered, the democratic

philosophy permeating its administrative machinery” (Levitan 1943, 359). These opposing arguments typify continuing discussions about the relationship between bureaucracy and democracy.

Just as discussion of politics and administration inevitably begins with the work of Woodrow Wilson, analysis of the concept of bureaucracy inevitably begins with the German sociologist Max Weber. In his classic examination of the concept of authority, he noted the importance of bureaucratic administration in supporting legal authority (as opposed to traditional or charismatic). The concept of bureaucracy, which is applied as easily to industrial and religious organizations as to those in governments, contains several elements, among them the following: “(1) [Officials] are personally free and are subject to authority only with respect to their impersonal official obligations, (2) they are reorganized in a clearly defined hierarchy of offices, (3) each office has a clearly defined sphere of competence..., (4) officials work entirely separated from ownership of the means of administration..., (5) they are subject to strict and systematic discipline and control in the conduct of the office” (Weber 1947, 328). In slightly more modern language, bureaucracy is characterized by hierarchical patterns of authority, a division of labor and specialization of tasks, and an impersonal arrangement of offices.

To Weber, and to many later writers, bureaucracy permits the greatest degree of efficiency in the conduct of human affairs and is therefore the most “rational” mode of social organization. Again Weber writes, “Experience tends universally to show that the purely bureaucratic type of administration... is, from a purely technical point of view, capable of attaining the highest degree of efficiency and is in this sense formally the most rational known means of carrying out imperative control over human beings” (Weber 1947, 333–334). In another passage, he writes, “Bureaucratic administration is, other things being equal, always, from a formal technical point of view, the most rational type” (Weber 1947, 337).

For those early students of public administration seeking the greatest possible efficiency in government agencies, the bureaucratic model, already becoming entrenched in industry, proved an attractive model. Fayol’s (1949) scalar principle, for example, depicted the levels of authority in an organization as links forming a pattern of communication. (Note, however, that Fayol did not argue for rigid adherence to hierarchical communications.)

Similarly, Willoughby (1927, 37) sought to make the executive branch into a “single, integrated piece of administrative machinery,” while Gulick (1937, 44) praised the principles of hierarchical organization as the “bootstraps by which mankind lifts itself in the process of civilization.” However, it was in the work of Herbert Simon that rationality in the field of administration received its most extensive treatment.

Simon began his analysis by noting the limits of human rationality, that human beings make decisions not on the basis of pure reason, as the classic model of economic man posits, but with the constraints of “bounded rationality.” Indeed, it is because human beings are limited in their capacities that they join together in complex organizations. “The rational individual,” according to Simon, “is, and must be, an organized and institutionalized individual” (Simon 1957, 102). It is through joining together in organizations that people can attain the kind of rationality (read “efficiency”) that escapes them elsewhere.

As members of complex organizations, however, individuals tend to behave in response to their own needs and interests. For example, Simon’s discussion of why people respond to organizational authority is based on an “inducement–contributions” formula—a calculus in which certain inducements are offered to individuals so that they contribute the desired actions. In making such decisions to contribute, individuals may not fully “maximize” their interests, but rather they “satisfice”; they select what they consider to be a satisfactory alternative (Simon 1957, xxvi). While “administrative man” is not fully rational, he does the best he can.

In contrast to the position that bureaucratic organization is the most rational form of social organization, others have argued that equating rationality and efficiency is not only theoretically incorrect, but it also leads to structures and behaviors antithetical to important norms of

a democratic society (Fischer and Sirianni 1994; Hummel 1994). More than a few critiques of bureaucratic life have appeared over the years (Scott and Hart 1979; Thayer 1973; Whyte 1956; but see also Goodsell 1994). Several books written by theorists in the field of public administration pointed out the major difficulties that seem to accompany bureaucratic organization.

In *The New Science of Organizations* (1981), Ramos argued that a market-centered society, based on the idea of instrumental rationality, the coordination of means to given ends, has come to dominate the way people think about organizing to the exclusion of other possibilities. In contrast, Ramos argues for a new science of organizations that would enable one to envision alternative organizational designs, leading in turn to a “multicentric” or “reticular” society in which differing forms of organization would be applied to different purposes. The dehumanizing aspect of modern bureaucratic thought was further examined in Denhardt’s *In the Shadow of Organization* (1981). Denhardt suggests a radical reordering of priorities so as to give primacy to the growth of the individual rather than to the efficiency of the productive process, something that would require an alternative, personalist approach to life in an organizational society. Harmon’s *Action Theory for Public Administration* (1981), while equally critical of the influence of instrumental rationality in structuring our understanding of organizational life, focuses more on ways of achieving responsible human action in organizational settings. Harmon sees the individual as an intentional being, acting so as to bestow meaning on human action.

More recently, McSwite’s *Invitation to Public Administration* (2002) calls for the avoidance of the “anti-human culture” of technical rationality that downplays values. Technical efficiency, as a basis for social decisions and action, clouds other civil and social relationships. A society must “continue to express and engage each other through our differences” (112). This means that a society must consider values and be responsive to issues. To do this, public administrators must provide a forum to sort differences about how people live together, rather than simply viewing themselves as public services managers. Peter deLeon (1997) contributes to this thinking by suggesting that policy sciences have strayed from their original intent of supporting democratic processes. He suggests “participatory policy analysis” to engage analysts and citizens in a mutual quest for solutions to public problems.

These general critiques apply with even greater force when one considers the value context of public administration. Whereas Gulick (1937), White (1936), and Willoughby (1927) held efficiency to be the primary objective of the study of public administration, Dimock challenged the mechanical application of the criterion of efficiency in public organizations, holding that efficiency alone is “coldly calculating and inhuman,” whereas “successful administration is warm and vibrant. It is human” (Dimock 1936, 120).

Others pointed out that efficiency was only one of many criteria by which the work of public organizations might be evaluated, especially in a democratic society. For example, Dahl (1947), in an important debate with Simon, suggested that public administration in a democratic society is almost by definition committed to values such as responsiveness, compassion, and concern. Efficiency may indeed be important, but it is often less important than the concerns of democracy. How would one evaluate the German prison camps of World War II, organizations that were marked by their efficiency?

A similar theme was developed by Redford (1969) in his book *Democracy in the Administrative State*. Redford (1969, 8) suggests that democracy rests on the concepts of individuality, equality, and participation, the latter including “(1) access to information, (2) access, direct or indirect, to forums of decision, (3) ability to open any issue to public discussion, (4) ability to assert one’s claim without fear of coercive retaliation, and (5) consideration of all claims asserted.” However, when one examines the way in which government agencies operate, one finds a far different set of assumptions in operation. The goals of the individual are subordinate to those of the organization, authority is distributed in a vastly uneven fashion, and there is relatively little opportunity for the participation of either those lower in the organization or clients of the organization in its decision

processes. Redford concludes that attainment of the democratic ideal in the field of administration depends on the representation of many and diverse interests among decision makers.

The classic treatment of these issues, however, remains Waldo's (1948) book, *The Administrative State*. In this work and in other materials, Waldo (1952, 1980) pursues the notion that, without conscious intent, those who developed various approaches to organizational design and conduct were engaging in the creation of political theory. That is, the materials they developed for use in organization circles had direct implications for the political values of the society. Specifically, Waldo argued that the selection of efficiency as the primary value of public administration led to the development of bureaucratic structures and practices, inconsistent with the normal standards of democracy. Indeed, it appeared that the earlier writers were arguing "'Autocracy' at work is the unavoidable price for 'Democracy' after hours" (Waldo 1948, 75).

The message of Waldo's work seemed clear: that an uncritical acceptance of the bureaucratic outlook constitutes a rejection of democratic theory. In contrast, Waldo called for a more democratic mode of organization, one consistent with the ideals of a democratic society. Such an alternative, he suggested, would necessarily involve a "substantial abandonment of the authority-submission, superordinate-subordinate thought patterns which tend to dominate our administrative theory" (Waldo 1952, 103). The mode of organization consistent with principles of democracy would necessarily be "postbureaucratic."

One final variant of the bureaucracy-democracy question asks whether democratic principles should be extended through many organizations in our society, not merely those in government. Certainly major aspects of public policy are being decided today by organizations that have traditionally been privately run. Moreover, there is no question that such organizations have a tremendous impact on the lives of individuals throughout the society, a point that has been made by various "communitarian" scholars (Bellah 1985; Etzioni 1993; Selznick 1992). Under such conditions, one might well ask whether all organizations, not just those in the public sector, should be evaluated by the degree of their publicness, the degree to which they are responsive to the needs and interests of an informed citizenry (Bozeman 1987). "Such a viewpoint directly suggests what public administration theorists in the past have often resisted: that public organizations should be required by definition to act in accord with democratic procedures and to seek democratic outcomes" (Denhardt 2004, 192-193).

III. ORGANIZATION AND MANAGEMENT

Our discussion of both politics and administration and bureaucracy versus democracy has emphasized the moral and political basis of work in public organizations. But what of the way in which public administration theorists have approached questions of organization and management? Have those theories and approaches that have been most influential in the field of public administration been distinctive in any way? Specifically, have they emphasized the values and concerns one would associate with democratic morality?

For the most part, the answer to these questions has been no. Theorists and practitioners in public administration have largely depended on the same approaches to organization and management as those in the private sector (see Vasu et al. 1998). However, there is some support for the view that those in public administration have been more interested in humanizing relationships, both internal and external, and have historically been far more responsive to client needs and interests than their counterparts in business. Interestingly enough, these are just the features that are being heralded in modern studies of business practice (see, for example, Block 1993; Milakovich 1995).

Certainly, as has been discussed, the early writers in the field of public administration were encouraged to follow the industrial or bureaucratic model of organization. Indeed, what came to be called the administrative management movement in public administration followed quite closely

the recommendations of those in business that managers give priority in thought and action to structural concerns such as hierarchical authority, unity of command, span of control, line–staff relations, and the division of labor. Gulick’s (1937) well-known essay “Notes on the Theory of Organization” exemplified the administrative management orientation. Gulick described the problems of management as those of creating an appropriate division of labor, then imposing on that division of labor mechanisms for coordination and control. He suggested four steps: (1) to define the job to be carried out, (2) to select a director, (3) to determine the nature and number of units required, and (4) to establish a structure of authority through which coordination and control can be achieved (Gulick 1937, 7).

An even more direct merging of public and private management occurred with the development of a generic orientation toward the study of management and organization. One major figure in this development was the public administrationist Herbert A. Simon, who joined others in pursuing a scientific study of administrative behavior. In pursuing regularities in human behavior in complex organization, these generic theorists came to argue that such regularities were largely independent of their context, that, for example, the exercise of power and the capacity to motivate or delegate are much the same whether one is describing a family, an industrial organization, or a government agency. From this viewpoint, there emerged a new social science, organizational analysis, drawing on work in business and public administration as well as sociology, psychology, and other disciplines.

This approach is well illustrated in Simon’s own analysis of decision-making processes. As a generic phenomenon, Simon contends, decision-making consists of intelligence (finding opportunities for decision-making), design (developing alternatives), and choice (choosing from among these). Again, consistent with Simon’s interpretation of human rationality, the decision maker hopes to maximize outcomes but is typically found to suffice.

Despite the appeal of the generic approach and its apparently closed system of decision-making, public administration theorists were quick to point out certain limitations. For example, Lindblom (1959) suggested that in actual practice Simon’s model of decision-making was rarely used. Instead, administrators typically chose an incremental approach, setting limiting objectives and making limited comparisons based on experience and personal values. Similarly, Allison and Zelikow (1999) argued that major policy decisions, such as those involved in the Cuban missile crisis of the Kennedy administration, do not follow either the classical rational actor model or that contained in theories of organization. Rather, he argued, decisions result from a political process of bargaining and negotiation played out in a rapidly changing environment.

Other scholars pursued the idea of environmental uncertainty, noting that open systems of organization cannot be guided by strict notions of efficiency in pursuit of their objectives, simply because environmental shifts mean things are always changing. Selznick’s (1949) study of the TVA examined the policy of decentralization and involvement of local groups that was employed by that agency in its early days. He pointed out that the key criterion for evaluating organizations in fluctuating environments is not necessarily their efficiency but their adaptability and their capacity to remain stable in the face of environmental changes. Similarly, Kaufman (1967) examined the environmental influences on rangers in the U.S. Forest Service, highlighting the efforts designed to maintain the loyalty and consistency of forest rangers in spite of the various environmental pressures placed on them at the local level.

Some time ago, Rainey and Milward (1983) discussed policy networks that cut across various specific organizations in the delivery of public programs. This work suggests that programs cut across agencies based on the kinds of organized interests that are involved. “Since programs are usually the focus for networks, program networks are the most important type of network for policy making. These are networks that form among groups, individuals and organizations on the basis of their interest in a particular program” (Rainey and Milward 1983, 143). More recently, Nelissen (2002) notes that new types of governance have emerged to tackle specific problems.

In this network perspective, there is an evolving dispersion of power. This recognizes the interconnectedness of the policy process with others—business, associations, nonprofit organizations, and citizens at large. Consequently, it makes more sense to talk not just about government, but also about governance. Governance can be defined as the traditions, institutions, and processes having to do with the exercise of power in society (Peters 2001). The governance process has to do with the way decisions are made in a society and how citizens and groups interact in the formulation of public purposes and the implementation of public policy. Today this process involves many different groups and organizations.

A concern for the influence of environmental factors on agency performance has also marked the work of those interested in implementation issues. Pressman and Wildavsky examined the failure of a particular economic development project, concluding that “what had looked like a relatively simple, urgent, and direct program—involving one federal agency, one city, and a substantial and immediate funding commitment—eventually involved numerous diverse participants and a much longer series of decisions than was planned” (1979, 113). In part, their recommendation was for legislative bodies to pay greater attention to creating organizational mechanisms for effective implementations as a part of policy formation; in part, it was a recommendation to scholars to consider more carefully the way in which implementation efforts affect or even determine policy outcomes (see also Bardach 1977; Wholey et al. 1986; Wildavsky, 1979).

An interesting and related interpretation of the work of public agencies was contained in Wamsley and Zald’s (1973) *The Political Economy of Public Organizations*. Wamsley and Zald propose a framework for analyzing administrative bodies by focusing on the juxtaposition of political factors and economic factors, in each case both those internal to the organization and those external to the group. Political factors are those involving power and interests, and economic factors are those affecting the market and its exchange of goods and services. It is the interaction of these various factors that establishes the capacity of the organization, including its organizational power structure (Downs 1967).

Wamsley and Zald’s emphasis on exchange mechanisms seems clearly related to Vincent Ostrom’s important work on public choice. Ostrom’s work is based on the assumption that rational individuals exercise their rationality with respect to public goods as well as private goods and that an analysis of public choices from this perspective will lead to important lessons for the design of public organizations. In this view, “Public agencies are not viewed simply as bureaucratic units which perform those services which someone at the top instructs them to perform. Rather, public agencies are viewed as means for allocating decision-making capabilities in order to provide public goods and services responsive to the preferences of individuals in different social contexts” (Ostrom and Ostrom 1971, 207). Ostrom pursues the logic of public choice to the point of identifying cases in which public enterprises can be operated within specific domains, thus opening the possibility for greater decentralization of power and authority. Ultimately his proposal is for a form of democratic administration based on multiorganizational relationships and intentional fragmentation, something the logic of public choice would see not only as more responsive, but also as more efficient (Ostrom 1973). (We should note that Ostrom’s work was criticized by Golembiewski (1977), who indicated that individuals may seek to maximize values that do not necessarily enhance a democratic society and may even corrupt it. See also Ostrom’s (1977) response.)

Unlike other writers with a primary interest in policy development (Edwards 1980; Kingdon 1984; Nagel 1980), Ostrom puts policy analysis to work in the critique rather than the justification of bureaucratic structures, thus connecting him to an otherwise quite distinct group of theorists interested in organizational humanism. The work of this group is usually traced back to the well-known Hawthorne experiments of the 1920s and 1930s. These experiments, basically begun as efforts to examine how favorable working conditions might influence worker productivity, resulted in documentation of the importance of social and psychological factors in the productivity of American workers. Specifically the research team found that in addition to creating goods or

services, organizations also serve the purpose of “creating and distributing satisfactions among the individual members of the organization” (Roethlisberger and Dickson 1940, 562).

The Hawthorne conclusions were reaffirmed in the work of Chester Barnard, who, based on his career of executive service, wrote eloquently of the informal or social aspect of organizational work. To achieve cooperation, Barnard wrote, one must take into account the many and often contradictory forces operating on the individual organizational member. “Cooperation and organization as they are observed and experienced are concrete syntheses of opposed facts and of opposed thoughts and emotions of human beings. It is precisely the function of the executive to facilitate the synthesis in concrete action of contradictory forces, to reconcile conflicting forces, instincts, interests, conditions, positions, and ideals” (Barnard 1938, 21).

Similarly, theorists such as Blake and Mouton (1981) and McGregor (1960) argued for a more humanistic approach to management, the former writing that a combination of high concern for productivity combined with a high concern for people is “positively associated with success, productivity, and profitability in comparison with any other theory” (Blake and Mouton 1981, 128). Most noteworthy, however, was the work of Chris Argyris, whose *Personality and Organization* (1957) was highly influential. Argyris noted that contemporary management practices, which tended to emphasize highly directive, control-oriented behavior on the part of managers, was actually counterproductive, for it was at odds with the basic striving of the adult personality. Argyris emphasized instead a style of management that stressed the manager’s understanding and facilitating of human development within the organization and eventually led to a strong concern for combining personal learning and organization development.

Among students of public administration, these various themes have been advanced most ably by Golembiewski (1972, 1985, 1995a, 1995b, 2001). Golembiewski’s work is most important for its infusion of moral considerations into discussions of organizational development and change. Golembiewski’s early work makes an important connection between humanistic approaches to management and questions of morality, holding that moral sensitivity can be associated with satisfactory output and employee satisfaction (1967, 53). His later efforts explored organization development as an approach to understanding and improving the work of complex organizations. Yet, even here, his concern for morality was evident. For example, he describes five “metavalues” that guide the laboratory approach to organizational change and development: (1) mutual accessibility and open communications, (2) willingness to experiment with new behaviors, (3) a collaborative concept of authority, (4) establishing mutual helping relationships, and (5) developing authenticity in interpersonal relationships (Golembiewski 1972, 60–66).

The humanistic tendencies of modern students of public administration were emphasized in the “New Public Administration,” a series of papers brought together at a conference at Syracuse University (Marini 1971). These papers, although hardly uniform in content or perspective, did tend to emphasize a more active role for public administrators in the development of public policy and a more equitable and participative approach to the management of public organizations. Perhaps most notable in the latter area were the articles of Kirkhart (1971) and White (1971), both of whom emphasized open communications, greater equality of power, and the importance of consensus building in organizations.

Public administration theorists in a variety of different works pursued these same themes through the 1980s and early 1990s. As noted earlier, Harmon (1981) examined the concept of the “proactive” administrator and has been joined by Hart (1974) in applying the philosophical approach of Rawls (1999) to public administration; Lipsky (1980) and Vinzant and Crothers (1998) emphasized street-level action; Baum (1983, 1987) employed psychoanalytic insight in attempting to understand the actions of public managers; though none so completely as Diamond (1993) in *The Unconscious Life of Organizations*. In this work, Diamond explores the unconscious dimensions of both hierarchic and other relationships in complex organizations, suggesting that these hold a key to understanding organizational culture and identity. Finally, Denhardt (1993) and Forester (1983)

have reviewed earlier work exploring the implications of critical social theory for educative approaches to management.

In parallel to these themes, a feminist critique of bureaucracy emerged. Denhardt and Perkins (1976) foreshadowed the “coming death of administrative man” by observing “some feminist theorists are developing alternative models of organization” (379). Ferguson’s (1984) book, *The Feminist Case against Bureaucracy*, discussed bureaucracy as gendered, manifesting masculine approaches to power and authority. Stivers (2002) refers to the “masculinization of thought” that drives public administration theory to conceive of control in administrative development in a distinctly masculine way. Some studies analyze differences in leadership styles of men and women (Bartunek et al. 2000). Other studies suggest greater attention to gendered perspectives offers the opportunity to rethink organizational structures (Buzzanell 2001).

Meanwhile, organization theorists only marginally connected to the field of public administration have set a high standard for public administration students interested in management concerns. The related concepts of culture and learning have perhaps been most noteworthy in their recent applications. Perhaps the best introduction to the notion of organization culture is provided by Schein (1997) (see also Deal and Kennedy 1982; Kilman et al. 1985; Ott 1989; Ritti 1998; Smircich 1983; Trice and Beyer 1993). Schein notes that the term culture can have a number of different meanings, including the dominant values espoused by an organization, the philosophy that guides an organization’s policy toward its employees and its customers, the feeling or climate that is conveyed in an organization, the rules of the game for getting along, the norms within working groups, and the behavioral regularities that are observed when people interact. None of these, however, captures the fullness of Schein’s description of culture as “the deeper level of basic assumptions and beliefs that are shared by members of the organization, that operate unconsciously, and that define... an organization’s view of itself and its environment” (12).

More recently, Khademan’s (2002) book, *Working with Culture*, raises the issue of public sector managers using organizational culture to transform an organization’s results. She argues that “tending to culture is an essential responsibility of top managers” (x) since it represents “the less tangible and less formal dimension of an organization that can support or sabotage change” (7). Using the idea of organizational culture, one can presumably understand more clearly the interactions among individuals who share a culture or participate either in subcultures or opposition cultures.

The recent emphasis on organizational learning directly follows earlier work by Argyris and Schon (1978) that suggests learning is the key to organizational change. Argyris and Schon argue that individuals hold espoused theories (those theories of action people profess to follow in their behaviors) and “theories-in-use” (those people actually follow). The typical discrepancy between the two is obviously destructive to the learning process and must be overcome for the most effective learning to occur. Such learning may be directed toward removing problems that limited a group’s theories-in-use, which is called “single-loop learning,” or it may be directed toward shifting the basic norms and values of a group, which is called “double-loop learning.” Beyond that, individuals and groups can also engage in “deutero learning,” that is, learning about learning.

The work of Argyris and Schon has been extended in numerous ways. However, some of the most interesting recent applications have been those of Peter Senge and his associates at MIT. Senge (1990) suggests that many organizations today suffer from learning disabilities that prevent them from being able to identify opportunities as well as the factors potentially threatening to them (see also Dibella and Nevis 1998; Garvin 2000; Oshry 1995; Schein 1999). In order to transform an organization into a “learning organization,” one that prevents learning disabilities from occurring, Senge suggests that five disciplines be used.

The first discipline, personal mastery, is described as an essential cornerstone to the learning organization. It is the discipline of constantly clarifying and deepening one’s personal vision, focusing energies, developing patience, and seeing reality objectively. A second discipline is involved in analyzing one’s own mental models, deeply ingrained assumptions, generalizations,

or images that influence how one understands the world and how one takes action. Once the mental models have been unveiled, they ought to be scrutinized so that alternative ways of thinking about the world can be considered.

The third discipline espoused by Senge concerns the idea of building a shared vision. Organizations need to bring people together around a common identity and a common sense of destiny: “When there is a genuine vision, people excel and learn, not because they are told to, but because they want to” (Senge 1990, 9).

The fourth discipline, team learning, stresses the importance of dialogue and the capacity of members to genuinely think together.

The fifth discipline, systems thinking, integrates all of the other disciplines together into a coherent body of theory and practice. According to Senge, learning disabilities related to any of the other disciplines stem from the inability to think systematically. Organizations need to think about and understand the forces and interrelationships that shape the behavior of systems. Change within organizations will come about more effectively if individuals understand and act more in tune with the larger processes around them.

Among public administration theorists dealing with management change, Denhardt’s (1993) *The Pursuit of Significance* closely parallels private sector works examining the best practices among the top managers. Based on interviews with highly progressive public managers, Denhardt identifies five strategies or approaches that seem to underlie the success of these managers. Denhardt proposes that public organizations should be driven by a commitment to a common purpose, by a concern for serving the public promptly and well, by empowerment and shared leadership, by pragmatic incrementalism, and by a dedication to public service. Utilizing these approaches, managers can make dramatic improvements to the quality and productivity of their organizations.

From this brief summary, it is clear that those in public administration have relied heavily on private sector work in their approach to organization and management. But one also gets a sense that among writers in public rather than business administration, humanistic considerations are not simply “useful,” but in fact are morally correct. It should not be surprising that such a feeling would prevail in public administration, marked as it is by concern for the public service. Interestingly, as noted above, while several recent books about management for the private sector have espoused a service orientation and a participative approach to shared power in organizations, exactly such tendencies have marked public administration theory for the past several decades. While often seen as copying the best practices of private sector managers, those in the public sector may, in the long run, provide some important lessons for those in business.

IV. THEORY AND PRACTICE

Whatever values and approaches researchers have endorsed, the communication of their findings has led to difficulties. The relationship between theory and practice, between knowledge and action, has been especially troublesome to those in the field of public administration for the last several decades. Practitioners have questioned the relevance of obscure research findings to the “real world” of public administration; they have objected to the elaborate and unnecessary jargon of academic research; and they have noted the apparent penchant of researchers for excessively detailed data analysis. Academics, on the other hand, have complained that practitioners are sometimes too shortsighted and too quick to dismiss findings that may be of value, and that they fail to see the long-term implications of research for practice. In either case, the result is an apparent gap between theory and practice.

In part, the theory–practice issue is a practical one—how can research findings be made available in an appropriate form to those in the field of practice? But the issue is also a theoretical one—in what way does the structure of knowledge acquisition affect the congruence of theory and

practice? It is this latter question that remains an issue in the development of public administration theory.

It is interesting to note that the theory–practice issue was not a special concern for the early writers in the field of public administration. Many of these individuals moved back and forth between administrative posts at the federal, state, and local level and research positions in the universities. A great deal of the public administration research that occurred during this period was generated within the newly formed institutes of government, university-based programs with a highly practical orientation toward administrative issues. When differences between theory and practice appeared, they were likely to center around normative issues rather than around questions of relevance.

It was only with the development of a “scientific” approach to public administration that questions about the relationship between theory and practice arose. Notable in this respect was the scientific management school associated with Frederick W. Taylor (1923). Even within the field of public administration there were efforts to establish scientific respectability. Both Willoughby (1927) and White (1936) argued for the possibility of an administrative science that would provide guides to action and in turn increase the efficiency of public organizations. Similarly, Stene (1940) argued that such an approach could be built by identifying propositions that could be tested scientifically.

As noted, the most significant move in the direction of developing a science of public administration occurred in the work of Herbert Simon in the late 1940s. Simon (1957) rejected the earlier principles or proverbs of public administration as being both naive and contradictory. To replace these principles, Simon sought to lay the groundwork for a truly scientific study of administrative behavior. His interpretation of science was that of logical positivism, a movement gaining prominence in the social sciences during this period. The key to this approach was the argument that facts and values could be separated, and that science is concerned with facts, not values. The advantage of studying facts, Simon said, was that propositions based on facts can be “tested to determine whether they are true or false—whether what they say about the world actually occurs or whether it does not” (Simon 1957, 45–46). In this view, scientific theories are general frameworks built on the objective observation of manifest behavior.

Simon’s view was clearly consistent with the emerging orthodoxy of the social sciences generally and soon became the mainstream orientation of research in public administration. However, such a development did not occur without criticism. Several scholars in the field of public administration joined Dahl (1947) in pointing out the important role of values in public administration and arguing that a pure science of administration was therefore inappropriate for the field. Again, the question of efficiency was raised. Simon, while maintaining the objectivity of his approach, continued to espouse the value of efficiency, writing that “the theory of administration is concerned with how an organization should be constructed and operated in order to accomplish its work efficiently” (Simon 1957, 38).

In his critique of this view, Waldo warned of the messianic tendencies of empirical social science, tendencies that led away from moral concerns. In his words, “So far did [political scientists writing on public administration] advance from the old belief that the problem of good government is the problem of moral men that they arrived at the opposite position: that morality is irrelevant...” (Waldo 1948, 23). To Waldo, the separation of fact and value would eventually lead to a disregard for questions of value.

More generally, critics of positivism raised several specific concerns about both the validity and the impact of the new approach (Fischer 1980). First, the separation of facts and values was attacked as unrealistic, perhaps even dangerous. Facts and values, it was held, are so intertwined that their separation for scientific purposes is artificial at best. Moreover, even the scientist, in choosing a topic to study, employs values, thus undercutting the claim to a “value-free” social science. Even more important, some argued that eliminating the study of values from public administration would lead to the objectification of organizational members and reinforce the image of a rigid and impersonal bureaucracy.

Second, many questioned the deterministic tendencies of positivist science. The new science of administration implied that human behavior followed certain predetermined laws that, once discovered, would enable the explanation, prediction, and control of human behavior. Such a perspective, however, did not seem to allow for the variability of human behavior, that human beings can and do change their patterns of behavior through learning and adaptation. Indeed, it was pointed out that the simple transmission of research results to those in the field of practice might lead them to new patterns of behavior.

Most important for our present purposes, the positivist orientation toward social science research created a distance between the researcher and the practitioner. This occurred in several different ways. First, the focus of mainstream social science on the observation of behavior from the outside, was at odds with the administrator's view of organizational life from the inside. Specifically the administrator views the world subjectively as a combination of facts and values, neither in isolation from the other. Consequently human beings do not react to one another as billiard balls on a table, but through exchanges of meanings and values. Research results that attempted to isolate the objective core of human interaction simply seemed out of touch. Second, the positivist interpretation of the scientist's role as simply that of theory builder left all the details of application to the practitioner. This placed an extraordinary burden on the practitioner, but it also allowed the scientist to avoid any sense of responsibility for the use of research results. Obviously such a situation seemed most unfair to nonscientists.

Over the past several decades, public administration theorists have joined other social scientists in examining alternative epistemological positions that would correct some of the deficiencies of positivism, especially its separation of theory from practice (Burrell and Morgan 1979). Among these alternatives, phenomenology (or interpretive theory) and critical theory have drawn the greatest attention from scholars in the field, though several other approaches have been explored (Harmon and Mayer 1986; Morgan 1983). Each of these approaches will be examined and the ways in which they help resolve the theory–practice dilemma will be noted.

Interpretive social theory—or action theory as some scholars in public administration have come to call it—has its roots in phenomenological studies early in this century. The phenomenological approach seeks to strip away the presuppositions that might bias the observation of behavior from the outside and instead focuses on the world as it is experienced from the inside. Subjective experience is seen to depend on human beings endowing their world with meaning; it is through people's actions and our intentions that they give shape to the world (Schultz 1967). In contrast to the positivist model, the interpretivist recognizes the inherent subjectivity of all human interactions, that all human beings as they live and work together are constantly constructing and reconstructing social reality (Berger and Luckman 1966).

As applied to organization studies, the phenomenological approach emphasizes “the typical actions of different actors and the meaning which they attach to their action” (Silverman 1971, 154). Specifically in the field of public administration, Kirkhart (1971) set the stage for interpretivist work with his proposal for a consociated model of organization. Kirkhart's model is based on the mutual disclosure and mutual recognition that underlie every reciprocal interaction, what phenomenologists call the “we” relationship. The result is a model of organization stressing adaptability, mutual disclosure, and noncompetitive trusting relationships.

Similar efforts have been made by Harmon (1981), Hummel (1984), and Jun (1986). Each of their works rests on a distinction between behavior (that observable to the outside world) and action (that intended from the inside). The development of action theories of public administration then builds on the meanings that are established by administrative actors. Interestingly, in such a study, the role of the theorist is to assist in clarifying the meanings and intentions of various actors, presumably resulting in consensual decision-making (Harmon 1981).

Such an interpretive perspective on organizational life is well characterized in a more recent collection of essays by Kass and Catron (1990). In this work, a variety of scholars explore the difficulties of establishing legitimacy in the field of public administration under circumstances in

which the basic images of the field may be flawed. In more practical terms, these suggestions might lead to an examination of those conditions of domination and dependency that often make public organizations unresponsive both to their members and to their clients. A representative work here is Camilla Stivers's (2002) book, *Gender Images in Public Administration*, in which Stivers argues that the prevailing images that underlie the defense of administrative power can be found in a masculine understanding of power and achievement. Only as the field is able to release itself from these gender-bound images will it be able to achieve substantial legitimacy. Finally, Ingersoll and Adams (1992) explore dimensions of myth and mythmaking in their study of *The Tacit Organization*.

A second alternative to positivist thought is critical social theory. Critical theory traces its roots back to Hegel's view of history as the unfolding of reason, something accomplished through the critique and elimination of those forces that limit the development of reason and freedom in society. As developed by the Frankfurt school of social thought, critical theory has pointed out the narrowing of the concept of reason in modern society from an earlier interpretation of reason as offering guiding principles in the process of enlightenment to a narrow contemporary version of rationality concerned only with the proper means toward given ends. This latter preoccupation with efficiency, critical theorists argue, not only restricts the possibility for individuals to act creatively and developmentally, but also reduces the kind of dialogue about values that is an essential component of a free society. The alternative sought by critical theory is one emphasizing "public, unrestricted discussion, free from domination, of the suitability and desirability of action-oriented principles and norms" (Habermas 1979, 118–119).

In applications to public organizations, Denhardt (1981, 1993, 2004), Dunn and Fozouni (1976), Forester (1983, 1993), and Hummel (1994) have argued for an approach that would establish a value-critical basis for the study of the formulation and implementation of public policy. Surely one aspect of such a study would be an examination of communications patterns within the public bureaucracy (Garnett 1992). Obviously, hierarchical patterns of communications restrict the possibility for undistorted communications among organizational members, in turn limiting the creativity and adaptability of organizations; creating greater opportunities for undistorted communications would be an essential corrective.

More recently, postmodernism critiques provide a new approach to analyzing the "real." Generally, postmodernists view knowledge, being based on language, as bounded by historical circumstances and an environmental context (see Spicer 2000). Postmodernists "deconstruct" the flaws underlying social, cultural, or political tendencies. Because of the limitations of language, reality is fluid, all interpretations are of equal validity. "Modernity... reflect[s] a complete faith in the capacity of reasoned language to capture the world. It... reflect[s] optimism, claiming the potential for complete understanding. Postmodernists would renounce this faith, this optimism, and this claim to power" (Farmer 1995, 47; see also Fox and Miller 1995; Miller 2002; Miller and Fox 1997; White and Adams 1995). Postmodernists reject what they see as the false hope of modern rational understanding (Denhardt, 2004).

In applying the postmodern perspective to public administration theory, Fox and Miller (1995) observe "that American representative democracy today is neither representative nor democratic" (Denhardt 2004, 168). Policy discourse is inherently political and dominated by symbols and socially created hierarchical bureaucracy. To redirect public policy considerations toward "authentic discourse," public administration must facilitate citizen discourse.

In a different approach, Farmer's (1995) book, *The Language of Public Administration*, argues the limitations of traditional public administration theory. Traditional public administration theory emphasizes instrumental rationality and hierarchical authority. To enhance public service, Farmer suggests a "reflexive" approach to revitalizing public administration theory.

The postmodernist approach to public administration is also present in McSwite's (1997) *Legitimacy in Public Administration*. McSwite concludes that public administration in America is unlikely to change until people learn (1) how it is possible to act without relying on reason, and

(2) how to come to terms with the idea of “otherness” (Denhardt 2004). In McSwite’s view, progress begins with opening ourselves to engagement with one another.

Common themes emanating from the postmodernist literature are skepticism of rationality, the need for authentic discourse in governance, and enhanced public dialogue. All three themes are required to reinvigorate public bureaucracy and reconstruct public administration’s legitimacy (Denhardt 2004).

As will be seen later, these perspectives have implications for the way public administrators approach the task of management itself. One alternative form of management, suggested by Denhardt (1994), would be “educative” in perspective, assisting organizational members and clients in identifying their true needs and in eliminating social conditions that prevent fulfillment of those needs. Such an effort, which would necessarily be accompanied by a greater democratization of organizational structures throughout society, should enhance democratic discourse. “Under such conditions, the public bureaucracy might even become a primary vehicle for societal self-reflection and critique” (Denhardt 2004, 165).

The more practical aspect of the issue still needs attention, both in an institutional sense (how can research findings be transmitted?) and in a more personal sense (how can receptivity to theory be increased?). With respect to the latter, two comments may be made. First, practitioners must recognize that whether they consciously construct theories of public organization or not, such theories at least implicitly guide their every action. Obviously, to the extent that such theories can be articulated, discussed, and clarified, they will provide a sounder basis for effective and responsible human action. In this sense, theory and practice are tied together through a process of learning. Second, both interpretive and critical theory suggest both the responsibility of the practitioner for thought as well as action and the responsibility of the theorist for action as well as thought. Whatever ways are found to employ the insights of the various approaches to knowledge acquisition reviewed here, the question of responsibility cannot be avoided.

Before leaving the issue of theory and practice, it is important to note a recent turn toward much more practical works in public administration, works lacking the strong theoretical basis of earlier work but having substantial impact on the field. Clearly most notable in this regard is the Osborne and Gaebler (1992) volume, *Reinventing Government*, a book that guided a great deal of thinking about management in the public sector including President Clinton’s National Performance Review (NPR) (see also Kaboolian 1998; Osborne and Plastrik 1997).

Osborne and Gaebler propose to reorganize government by creating entrepreneurial incentives for the purpose of giving priority to the consumer, reducing bureaucracy, and empowering employees. By doing this the authors hope to create a “governmental market” that will (1) save the government money and significantly decrease wasteful spending or bad investment choices, (2) increase the efficiency of governmental employees and the entire system of government, and (3) reduce the amount of red tape within the system. In theory these proposed changes will result in a consumer-empowered, competitive, and market-oriented government that will reduce regulations, create revenue through fees and charges, and concentrate on the decentralization of authority, the privatization of management, and quality improvement in public agencies (see also Lynn 1996; Pollitt 1990).

Although *Reinventing Government* was used as a model by Vice President Al Gore and the NPR, there are a host of critiques to this proposed way of reorganizing government. For instance, Frederickson (1992) states that the major problem areas of the book are the idea that the government is a “market” and the citizens are the “customers,” that downsizing will decrease the size and cost of government without diminishing its effective level of functioning, and the assumption that the employees of government are the primary problem. Moe (1994) states that Osborne and Gaebler emphasize economically based issues over legally based values, use unsubstantiated and irrelevant statistics to support major changes in laws and government, and misunderstand the role of law within administration of the executive branch. These critiques suggest that government could

possibly become more complicated, less effective and authoritative, and ultimately weaker and unsuccessful in serving its citizens.

In an even more practical description, Linda Kaboolian notes that the new public management advocates administrative technologies such as customer service, performance-based contracting, competition, market incentives, and deregulation. “Market-like arrangements such as competition within units of government and across government boundaries to the non-profit and for-profit sectors, performance bonuses, and penalties loosen the inefficient monopoly franchise of public agencies and public employees” (Kaboolian 1998, 190; see also Barzelay 2000; DiIulio 1994; Kearns 1996; Kettl 2000; Kettl and Milward 1996; Light 1997; Peters 2001; Pollitt and Bouckert 2000). Correspondingly, the new public management emphasizes approaches such as privatization, performance measurement, strategic planning, and other managerialist approaches. Obviously, there are implications of this move for governmental efficiency, but there are also implications for issues of responsiveness as well. Christopher Hood writes that the new public management moves away from traditional modes of legitimizing the public bureaucracy, such as procedural safeguards on administrative discretion, in favor of “trust in the market and private business methods... The ideas... [are] couched in the language of economic rationalism” (Hood 1995, 94). Similarly, Kettl writes, “Painted with the broadest brush, these reforms sought to replace the traditional rule-based, authority driven processes with market-base, competition-drive tactics” (Kettl 2000, 3).

In contrast to the New Public Management, the recent book by Denhardt and Denhardt (2003), *The New Public Service: Serving, Not Steering*, stands on a much stronger theoretical footing. Denhardt and Denhardt “reject the notion... [of] the reinvented, market-oriented New Public Management” (24). Instead, they offer an alternative set of unifying themes and principles about the role of public administration in governance. This organizing framework features public service, democratic governance, and civic engagement aimed at advancing the dignity and the values of citizenship and the public interest. The distinguishing characteristics of this emerging perspective are summarized as follows (Denhardt and Denhardt 2003, 42–43):

1. *Serve Citizens, Not Customers.* The public interest is the result of a dialogue about shared values rather than the aggregation of individual self-interests. Therefore, public servants do not merely respond to the demands of customers, but rather focus on building relationships of trust and collaboration with and among citizens.
2. *Seek the Public Interest.* Public administrators must contribute to building a collective, shared notion of the public interest. The goal is not to find quick solutions driven by individual choices. Rather, it is the creation of shared interests and shared responsibility.
3. *Value Citizenship over Entrepreneurship.* The public interest is better advanced by public servants and citizens committed to making meaningful contributions to society than by entrepreneurial managers acting as if public money were their own.
4. *Think Strategically, Act Democratically.* Policies and programs meeting public needs can be most effectively and responsibly achieved through collective efforts and collaborative processes.
5. *Recognize That Accountability Is Not Simple.* Public servants should be attentive to more than the market: they should also attend to statutory and constitutional law, community values, political norms, professional standards, and citizen interests.
6. *Serve Rather than Steer.* It is increasingly important for public servants to use shared, value-based leadership in helping citizens articulate and meet their shared interests rather than attempting to control or steer society in new directions.
7. *Value People, Not Just Productivity.* Public organizations and the networks in which they participate are more likely to be successful in the long run if they are operated through processes of collaboration and shared leadership based on respect for all people.

V. THEORIES OF PUBLIC ORGANIZATION

While a number of important theoretical issues have faced the field of public administration over its relatively short history, the question of whether there is such a thing as public administration theory has proven one of the most difficult. Certainly those attempting to answer theoretical questions related to the conduct of public organizations have drawn material from political theory, organizational theory, social theory, economic theory, ethical theory, and more. They have come to this study from a variety of perspectives—as practitioners interested in finding answers to specific problems, as empirical social scientists seeking to contribute results that would build a body of theory, and as self-conscious theorists hoping to construct a broad framework for understanding life in public organizations. Given the diversity of backgrounds and interests represented in the development of public administration theory, it is not surprising that there is little agreement in the field, even about what constitutes good theory.

The question of whether a theory of public administration is possible is closely related to the question of whether a separate and identifiable discipline of public administration is possible, since presumably one mark of the disciplinary status is the development of a coherent and integrated theoretical viewpoint. A brief historical review will clarify the issues here. Obviously the early development of the study of public administration occurred within the discipline of political science, and indeed there are many today who argue that public administration is merely one subfield of political science. From this perspective public agencies play an important role in the governance process, in what Easton (1965, 50) called the “authoritative allocation of values.” Such agencies are seen to affect the decisions of government in many ways, ranging from their influencing the formulation of public policy to their exercising discretion in the implementation of policy. If this is the case, it is argued, public administration is a part of political science and the theory appropriate to its study and practice is political theory. In this view, theoretical dialogue in the field of public administration should focus on issues such as freedom, justice, and equality.

Exactly such focus was found in early studies of public administration, but more recently a different perspective has emerged. As previously discussed, others have argued that public organizations are first and foremost organizations and therefore are confronted with questions having to do with their managerial efficiency. Issues surrounding the exercise of delegation, for example, are much the same whether one is a manager in a private corporation or in a federal government agency. If this is the case, it is argued, public administration is a part of management and the theory appropriate to its study and practice is generic management theory. In this view, theoretical dialogue in the field of public administration should focus on such issues as communications, motivation, and group dynamics.

Somewhere between these two views is the view expressed most prominently by Dwight Waldo that public administration is a profession, drawing from many different disciplines and many different theoretical perspectives. This view is probably the prevailing view in the field today. However, it presents several difficulties. On the one hand, there is the practical problem of employing theories oriented to other fields as guides to practice. From the viewpoint of the administrative practitioner, neither political theory nor organization theory directly matches the concerns of the real world; they simply are not directed to the specific questions administrators face. They leave out essential components. This leads to a second question, the theoretical problem of reconciling theories generated out of widely varying disciplinary perspectives. For example, how is it possible to bring together the interests of political theory in equality and freedom and the interest of organization theory in hierarchy and control?

If one takes the position that political science fails to comprehend the full range of concerns of those in public organizations by failing to give full consideration to organizational and managerial concerns; if one takes the position that organizational analysis is also limited through its failure to adequately comprehend the moral and political context of work in public organizations; and if one takes the position that a view of public administration as a professional field of study fails in that it

must always borrow from other disciplines and never address the concern of public administration directly—is there any hope of developing a coherent theory of public organizations and consequently a discipline suited to the interests of those in such organizations?

Denhardt (2004) argues that a redefinition of the field might enable such a development. Specifically, in his view, such a revised definition should focus on public organizations generally rather than on the administration of governmental agencies and should see public administration as a process rather than as an activity occurring within a particular type of institution (e.g., a bureaucratic agency). The definition chosen should bring together the concerns of political theory for justice, equality, and responsiveness with the concerns of organization theory for effective change processes. As a tentative definition, Denhardt suggests that public administration is concerned with “managing change processes in pursuit of publicly defined societal values” (Denhardt, 2004, 16).

This view of the public manager suggests an individual sensitive to the impact of interpersonal and structural relationships on the development of stable or changing patterns of organizations, some one able to recognize and respond to the subtleties of organizational change processes. It also acknowledges that the public manager stands in a special relationship to the design and implementation of societal values, a relationship that provides an ethical basis for public management. “The [public] manager lives in the nexus of a political and administrative world and therefore is neither an independent actor nor solely an instrument of the political system. In this singular position, the manager accepts, interprets, and influences the values which guide the application of skills and knowledge” (Denhardt and Nalbandian 1980).

This new definition brings together the insights of political science and organizational analysis (while allowing for the contribution of other disciplines as well). In this way, it becomes possible to develop theories of public organization rather than merely theories related to public administration. Moreover, the new definition suggests the important role of those in public organizations in influencing public life and their responsibility to manage their activities in a way consistent with the standards of democracy. In this way, the various issues that have been discussed previously take on different dimensions about the role of public administration in governance. This opens the way for unifying themes and principles, like the New Public Service, focused on a reinvigorated public service, democracy, and civic engagement.

For example, the new definition suggests a resolution of the politics–administration dichotomy by acknowledging that the public manager is in a position not only to respond to legislative mandates but also to articulate, in a more direct fashion, the needs and interests of individuals in the society in a more direct fashion. Such a position suggests an active role for the administrator, but at the same time underscores both the moral and political basis of work in public organizations. This new approach to the field acknowledges that since the public manager is to be actively involved in the public expression of societal values, an active and continuing concern for democracy must be given priority over the values of bureaucracy, and even efficiency.

Similarly, the way in which people understand the relationship between questions of organization and management may be affected. By focusing on processes rather than structures, this approach suggests the necessity of understanding the role of the individual in effecting organizational and social changes. Such an approach, one might note, is consistent with the demands of a rapidly changing society requiring organizations to be especially adaptive, something that can only occur under conditions that encourage and indeed enable individuals to exercise both creativity and responsibility.

Finally, by emphasizing once again the moral and political basis of work in public organizations, this approach suggests a joining of knowledge and action, of learning and change. In turn, it suggests a new role for those in public administration theory, a role that recognizes that public administration theorists share a moral obligation with those who practice. The responsibility of the theorists has in the past been minimal, the escape to the ivory tower all too easy. Recognizing, in fact emphasizing, the moral and political nature of the public service makes that escape more difficult, but it also makes the enterprise of developing theories of public organization one of great significance.

I. INTRODUCTION

A. PURPOSE

1. Chronological Approach

This historical and bibliographic essay presents chronologically the major documents, publications, and theoretical and empirical developments most enduring in the literature and most influential in the profession of American public budgeting and financial management.* The diversity of sources reflects the fact that the field itself has emerged and evolved from the concerns and contributions of both practitioners and academics, as well as from the interplay among theoretical and applied research and analyses (Rubin 1990). Enduring commitments to limited government and to flexible federalism have also been critical, as they nurture the adaptive transfer of ideas, experiences, and innovations among national, state, and local governmental units and between governmental and nongovernmental institutions.

History is not the only legitimate point of reference, but it is the conventional one (McCaffery 1987; Webber and Wildavsky 1986). It is the overall organizing element for this chapter. Because the effects of some ideas or developments may be intermittent, recursive, continuous, delayed, or of such magnitude that they defy a simple timeline, periodization by calendar years and decades imposes an artificial coherence on a complex story. Moreover, a historical analysis requires that attention be paid to both historical continuity and disjuncture. Recurring themes such as federalism, separation of powers, and administrative capacity underscore the former, but only the latter appears in a chronology (see Table 5.1).

2. Federal Emphasis

The historical emphasis here is on the federal government because it currently dominates the system financially, economically, and intellectually. It offers the only nationally applicable model we have. Furthermore, federal practices and processes are relatively sophisticated and are therefore interesting to scholars and practitioners. Considering the variety and number of experiences and experiments associated with state and local governments, a federal focus allows some analytical order to be imposed on what could easily become a complicated, even chaotic story. For the most part, the contemporary literature reflects this same analytical choice. From a systemic perspective, a chronology of pivotal developments primarily at the federal level is best linked to significant state and local trends and the literature.

3. Bibliographic Criteria

The bibliographic component is a composite of official and unofficial publications, practitioner and academic writings, and major events and trends at various levels of government (most of the numerous court decisions impinging on practice in the field are excluded for reasons of space and clarity). A diverse, mushrooming literature—the size, variety, and technical language of which probably threaten as much as entice the uninitiated—compels compassionate and responsible selectivity. It is useful to repeat an observation by Frederick A. Cleveland, then director of New York City’s influential Bureau of Municipal Research: “Difficulty in tracing the evolution of the ‘budget idea’ in the United States lies not so much in the historical material to be mastered as in decision as to what ‘idea’ is to be discussed” (Cleveland 1915, 15). For our purposes, choices are drawn from four standard categories, including statutes and other sources of the major legal

*The author extends her appreciation to the University of Connecticut’s Political Science Department for its ongoing research support and to Zsolt Nyiri and Jason hiulietti for their research assistance.

TABLE 5.1
Chronology of Federal Budgeting, 1789–1995

From the Constitution through World War II

1789	U.S. Constitution, Art. 1, Sec. 7, revenue bills originate in House (and appropriations, by custom); Art. 1, Sec. 9, appropriation needed for expenditure and public receipts and expenditures
1789	An Act to Establish the Treasury Department (1 Stat. 12). Established elements underlying federal financial system including disbursements, accounting, and reporting and offices of Secretary of the Treasury, Comptroller, and Auditor
1791	First internal tax—on distilled spirits—passed by Congress
1802	Ways and Means Committee established as standing committee
1816	Senate Committee on Finance established
1819	In <i>McCulloch v. Maryland</i> , the U.S. Supreme Court established federal government's immunity from state taxation
1837	House Rule XXI. Unauthorized appropriations and appropriations in legislation barred
1850	Senate Rule XV. Unauthorized appropriations barred
1865	House Appropriations Committee established
1867	House Appropriations Committee created
1871	First Civil Service Commission (1872–1873) created through rider to appropriations bill
1894	Dockery Act. Established fiscal accounting practices
1906	Antideficiency Act (31 U.S.C. 1511 et seq.). Initiated apportionment of funds (amended in 1950 to allow budgetary reserves and in 1974 to restrict budgetary reserves).
1906	Government Finance Officers Association (GFOA) established as professional association of state/provincial and local finance officers in U.S. and Canada
1912	Report of the (Taft) Commission on Economy and Efficiency. Expressed need for national budget and executive budget
1913	US Constitution, Amendment Act. XVI. Congress fully empowered to tax income
1913	Federal Reserve Act. Established institutions and system for national monetary policy; for first time Congress delegated considerable power over the federal budget and national economy
1917	Liberty Bond Acts. Authorized Treasury to pay debts and borrow on US credit to specified amount ("debt ceiling")
1921	Budget and Accounting Act (31 U.S.C. 1101 et seq.). Established executive budget system, Bureau of the Budget, and Government Accountability Office (GAO, now Government Accountability Office)
1933	Congress created independent public corporation, Tennessee Valley Authority (TVA)
1935	Social Security program established
1937	Report of the President's Committee on Administrative Management (Brownlow Committee). Expressed President's managerial role in executive branch and need for powers and staff.
1937	Tax Foundation founded as an organization which, through research and analysis, would inform and education Americans using objective, reliable data on government sources
1939	Reorganization Plan No. I (Executive Order 8284). Transferred Bureau of the Budget with expanded role to new Executive Office of the President
<i>The postwar period</i>	
1945–1949	
1945	Government Corporation Control Act. First attempt to regularize and control government corporations' financial activities
1946	Employment Act of 1946. Established Council of Economic Advisors and Economic Report of the President
1946	Administrative Procedure Act. Standardized administrative practices among agencies
1946	Legislative Reorganization Act. Established legislative budget (discarded in 1949)
1949	Concluding Report of the Commissions on Organization of the Executive branch of the Government (first Hoover Commission). Emphasized presidential role in executive management and "management movement" made recommendations for reorganization of the executive branch, and called for performance budgeting
<i>The 1950s</i>	
1950	Budget and Accounting Procedures Act. Aimed at control and accountability in executive agencies' funds, established requirements for budgeting, accounting, financial reporting, and auditing, and mandated performance budgeting
1950	Omnibus Appropriations Act. All regular spending in a single appropriation bill for first time (but return to separate bills in 1951)
1953–1955	Second Hoover Commission. Recommended limiting government activities that compete with private sector and other recommendations on budgetary and financial practices

(Continued)

TABLE 5.1 (Continued)**From the Constitution through World War II***The 1960s*

1961	Planning–programming–budgeting system (PPBS) adopted in Department of Defense
1962	Executive Order 10988. Unionization of federal employees encouraged
1965	Bureau of the Budget's bulletin no. 66-3. Provided for PPBS in executive departments and agencies (until abandoned in 1971)
1965	Amendment to Social Security Act created Medicare
1966	BOB circular A-76. Implemented government policy to use private suppliers that are competitive on a cost comparison basis; expanded in 1979
1967	President's Commission on Budget Concepts. Unified budget adopted

The 1970s

1970	Legislative Reorganization Act. Expanded role of Government Accountability Office (program evaluation) and provided for five-year budget projections
1970	Reorganization Plan No. 2. Reconstituted Bureau of the Budget as Office of Management and Budget (OMB) and reemphasized management role
1971	Requirements for PPBS formally voided
1972	Nixon administration made use of unprecedented, massive rescissions and impoundments in domestic programs
1972	State and Local Fiscal Assistance Act (P. L. 92-512). Established general revenue sharing and inaugurated "new federalism." Terminated in 1986
1972	Government Accountability Office issued comprehensive statement of standards for governmental audits
1972	Joint Study Committee on Budget Control established. With significant modifications, 1973 report to emerge as 1974 budget act
1973	Comprehensive Employment and Training Act (CETA). Created financial assistance to state and local governments for training and employment
1974	Congressional Budget and Impoundment Control Act. (P. L. 93-344). Established congressional budget process and timetable. House and Senate Budget Committees, Congressional Budget Office, and procedures for reviewing rescissions and deferrals
1974	Automatic cost-of-living adjustments (COLA) added by amendment to Social Security Act
1977	Office of Management and Budget's bulletin no. 77-9. Zero-base budgeting introduced into executive departments and agencies (and officially terminated in 1981)
1978	Full Employment and Balanced Growth Act (Humphrey-Hawkins Act). Congress authorized president to propose and initiate action with respect to production, prices, and employment
1978	Inspector General Act. Created independent units in major domestic agencies to conduct audits and investigations to reduce fraud, waste, and abuse

The 1980s

1980	Reconciliation process. First use as part of first budget resolution after change allowing use at beginning of congressional budget process
1981	Reagan administration abandoned zero-base budgeting through OMB circular A-11
1981	Omnibus Reconciliation Act. Use of reconciliation in first resolution
1981	Economic Recovery Tax Act. ERTA introduced major tax cuts, including reducing highest individual tax bracket
1981	Executive Order 12291 required new, major regulations with annual economic impact of \$100 million or more be subjected to cost-benefit analysis
1981	In November, when President Reagan vetoed a continuing resolution, 400,000 federal employees told not to come back when they went for lunch; a few hours later, President Reagan signed a new version of the continuing resolution and the workers were back the next morning
1982	Balanced budget amendment approved in Senate but not in House
1982	In <i>Immigration and Naturalization Service v. Chadha</i> , U.S. Supreme Court undermined legislative veto
1982	Federal Managers' Financial Integrity Act (31 U.S.C. 3512). Intended to reduce fraud, waste, and abuse in agency operations by requiring assessment and reporting annually on internal controls and accounting systems
1982	Tax Equity and Fiscal Responsibility Act (TEFRA). TEFRA instituted significant changes in medical and casualty deductions and pensions and retirement plans
1982	OMB stipulated guidelines for evaluating internal controls in accordance with OMB circular A-123
1983	Comptroller General issued standards for internal controls in federal agencies
1984	Report of the President's Private Sector Survey on Cost Control (Grace Commission). Emphasizing efficiency and savings, issued 47 reports including almost 2500 recommendations and concluded that federal reporting and accounting systems are inadequate

(Continued)

TABLE 5.1 (Continued)

From the Constitution through World War II

1984	Single Audit Act. Streamlined intergovernmental financial system by establishing uniform requirements for comprehensive, single audit of federal grant recipients
1984	Federal Capital Investment Program Act. As of 1985, the president's annual budget submission is required to highlight capital investment expenditures within the unified budget
1984	The Governmental Accounting Standards Board (GASB) organized to establish standards of financial accounting and reporting for state and local government entities
1984	Fiscal year starts without a budget and, in October, 500,000 federal workers are sent home; an emergency spending bill has them all back at work the next day
1985	Balanced Budget and Emergency Deficit Control Act (GRH, P.L. 99-177, the Gramm-Rudman-Hollings Act). Provided for annual reductions in the budget deficit from fiscal 1986 to zero in fiscal 1991 (balanced budget) through mandatory sequestration (canceled budget resources) if projected deficit exceeded target; legislative vehicle was debt limit extension
1985	Executive Order 12498 established OMB's clearance of regulations, including agencies' regulatory policy and proposals
1985	General revenue sharing for local governments not reauthorized in reconciliation bill for fiscal 1986
1986	In <i>Bowsher v. Synar</i> (106 S.Ct. 3181), Supreme Court invalidated GRH's automatic trigger mechanism for sequestration as violation of separation of powers
1986	Tax Reform Act (P.L. 99-514). Introduced the Internal Revenue Code of 1986 with major overhaul of tax system including reduced individual tax rates and number of brackets, elimination of many tax deductions and preferences, and reinstatement of standard deduction (1944-1977)
1986	Amendment to Defense Authorization Act for fiscal 1987 (P.L. 99-145, Sec. 1405). Congress mandated that president submit first biennial defense budget for fiscal 1988 and 1989
1986	Balanced budget amendment fails by one vote in Senate
1986	500,000 workers are out for a half day in October; President Reagan signs final appropriations bill and the workers are ordered back for the next shift
1987	Following stock market's plunge in October, successful executive-legislative negotiations led to two-year budget agreement
1987	Balanced Budget and Emergency Deficit Control Reaffirmation Act (P.L. 100-119). Amended 1985 GRH to reset deficit reduction targets and postpone balanced budget to 1993; automatic sequestration trigger restored and responsibility assigned to OMB; legislative vehicle was debt limit extension
1988	Accepting Republican nomination, George Bush promised no tax increases in his "read my lips" pledge
1988	<i>South Carolina v. Baker</i> . Upholding sec. 310(b)(1) of 1982 TEFRA, Supreme Court found that there is no constitutional entitlement not to pay taxes on income earned from state and local bonds
1988	Passage of Indian Gaming Regulatory Act permits casino gambling on reservations
1989	In effort to reduce pork-barrel politics, independent commission was established by law to recommend closing or downsizing obsolete military bases
1989-1990	Deficit exceeded GRH deficit targets each fiscal year
<i>The 1990s</i>	
1990	President Bush's submitted budget included proposal for constitutional amendment on balanced budget, item veto authority, biennial budgeting, and more
1990	For second time in history, House considered a balanced budget amendment to the Constitution and it fell seven votes short of requisite two-thirds majority; Senate Judiciary Committee reported balanced budget amendment
1990	Federal employees temporarily furloughed during budget impasse
1990	Federal Credit Reform Act changed budgetary treatment of loans and loan guarantees through government-owned and government-sponsored corporations to subsidize cost of loans for which funds must be budgeted and appropriated
1990	Chief Financial Officers (CFO) Act assigned responsibility for federal financial management to OMB's deputy director for management and the Office of Federal Financial Management; provided for appointing CFOs in 23 major departments and CFO council; effort to establish integrated financial management systems linking budgeting and accounting and monitoring budgetary execution; requires agencies prepare auditable financial statements
1990	OMB, Treasury, and GAO establish Federal Accounting Standards Advisory Board (FASAB) to develop uniform accounting standards
1990	Omnibus Budgeting Reconciliation Act (P.L. 101-508) for fiscal 1991 raised income tax rates for high-income earners, incorporated five-year spending reduction aimed at saving approximately \$500 billion, and effectively repealed GRH; subsequent appropriations passed, many without final legislative text in hand

(Continued)

TABLE 5.1 (Continued)**From the Constitution through World War II**

1990	Budget Enforcement Act of 1990 (BEA; Title XIII of 1990 OBRA) made major changes in GRH and 1974 Congressional Budget Act; shifted focus from fixed deficit limits to spending control; created new deficit controls based on variable deficit targets extended through fiscal 1995; established caps on discretionary spending and the “pay-as-you-go” rule (deficit neutral) for revenues and direct spending; and revised sequestration procedures (mini-sequesters)
1992	Multiple versions of balanced budget amendments proposed but fail to pass Congress
1993	President Clinton’s deficit reduction package increased the marginal tax rate for high-income earners
1993	OMB revised its 1984 circular A-127, “Financial Management Systems,” and required that each agency create a single, integrated system of financial management
1993	National Performance Review (NPR) included budgetary and financial management recommendations, including increased managerial discretion (e.g., lapses, staffing ceilings, restrictive itemization) and biennial budget cycle
1993	Executive Order 12839 instructed agencies to cut employment by 5% or about 100,000 employees from 1993 to 1995
1993	Government Performance and Results Act of 1993 (GPRA; P.L. 103-62). On an eight-year implementation schedule, required federal agencies to set annual performance targets; OMB to submit government-wide performance plan budget beginning for fiscal 1999
1993–1994	President Clinton adjusted maximum deficit amount under BEA when budget submitted
1994	In his budget message for fiscal 1995, President Clinton claimed cuts in approximately 340 discretionary programs in 1994 and proposed cuts in approximately 300 nondefense programs, including termination of more than 100 programs
1994	Federal Acquisition Streamlining Act updated and simplified procurement procedures
1994	<i>Contract with America</i> signed by 376 Republican candidates, including many congressional candidates; with accent on accountability and reduced governmental role, proposals encompassed independent, comprehensive audit of Congress; supermajority for passing tax increases; zero-baseline budgeting; balanced budget and tax limit amendment; line-item veto; regulatory reform including use of risk assessment and cost-benefit analysis; and unfunded mandate reform
1994	OMB’s circular A-34, “Instructions on Budget Execution,” revised to account for changes in laws and practices since last major revision in 1985
1994	OMB’s circular A-II, “Preparation and Submission of Budget Estimates,” revised to account for Government Performance and Results Act of 1993
1995	Line-item veto and balanced budget amendment again defeated
1995	Unfunded Mandates Reform Act (P.L. 104-4). With emphasis on disclosure and accountability, required that CBO provide cost estimates to authorizing committee for government mandates over \$50 million threshold (\$100 million for private sector mandates), excluding categories such as constitutionally guaranteed civil rights; created point of order against considering a bill without CBO’s cost estimate and against unfunded mandate with aggregate cost in excess of threshold; in effect, Congress must go on record as endorsing the mandate
1995	Under federal legislation, a financial oversight entity (control board) is established for Washington, DC
1995	OMB issued final revisions to circular A-87, “Cost Principles for States, Local and Tribal Governments,” thereby setting costing standards for grants, reimbursements, and contracts
1995	Bills introduced to require use of risk assessment and cost-benefit analysis in federal agencies enlivened but left unsettled methodological issues in budgeting and policy making
1995	Moratorium on regulatory rule making passed House and Senate
1995	Congress moved to terminate as entitlements and devolve program responsibility to states Aid to Families with Dependent Children, food stamps, and Medicaid by approving dollar caps on block grants to states
1995	Debt ceiling held hostage (at \$4.9 trillion) in budget standoff between president and Congress; federal agencies closed and 800,000 “nonessential” employees temporarily furloughed in November
1995	More than one-half of states’ budgets use effectiveness and/or productivity measures
1996	On July 18, House of Representatives passes (by vote of 256 to 170) its budget reconciliation package, H.R. 3734, containing a modified version of the Personal Responsibility and Work Opportunity Act of 1996, H.R. 3507. The Personal Responsibility and Work Opportunity Reconciliation Act of 1996 (PRWORA) (Pub. L. 104-193), as amended, is the welfare reform law that established the Temporary Assistance for Needy Families (TANF) program. TANF is a block grant program designed to make dramatic reforms to the welfare system by moving recipients into work and turning welfare into a program of temporary assistance. TANF replaced the national welfare program known as Aid to Families with Dependent Children (AFDC) and the related programs known as the Job Opportunities and Basic Skills Training (JOBS) program and the Emergency Assistance (EA) program

TABLE 5.1 (Continued)

From the Constitution through World War II

1996	Line Item Veto Act of 1996 (P.L. 104-130) authorized the president to cancel discretionary budget authority, new entitlements, and limited tax benefits
1997	The Budget Enforcement Act of 1997 (BEA of 1997) required OMB to issue an end-of-session report after Congress adjourns <i>sine die</i> to determine whether or not a sequester is required
1997	Government Performance and Results Act requires federal agencies to prepare strategic plans starting with fiscal year 1997
1998	In <i>Clinton v. City of New York</i> , 524 U.S. 417 (1998), the US Supreme Court declared the Line Item Veto Act of 1996 in violation of Article I, Section 7, Clause 2 of the Constitution
1998	The first surplus since 1969 is reported for federal budget reported under Franklin D. Raines, OMB Director under President Clinton
1999	Government Performance and Results Act requires federal agencies to prepare annual performance plans starting with fiscal year 1999
<i>The Twenty-First Century</i>	
2000	Government Performance and Results Act requires federal agencies to submit to the President and Congress an annual program performance report comparing actual performance with their plans beginning in fiscal year 2000
2001	Economy entered official recession in March
2001	On September 11, four hijacked airplanes are used in an attack of international terrorism at World Trade Center, the Pentagon and Shankesville, Pennsylvania; immediate budgetary ramifications include federal aid to New York City, rebuilding the Pentagon, \$40 billion aid to airlines and insurance bailouts, and economic loss to New York City and the travel, tourist and other industries
2001	Three days after the attack, Congress, at request of President Bush, votes \$40 billion in emergency funds
2001	Tax cuts enacted in 2001 reduced individual income taxes as a share of GDP from an all-time high
2001	When Enron collapsed and is declared bankrupt in December, it had about \$5 billion in outstanding "prepays" that were virtually unknown to the company's creditors, investors and business associates; report of Senate Governmental Affairs Committee's Permanent Subcommittee on Investigations found that the board had failed in its fiduciary duty to protect Enron shareholders and that it shares responsibility for Enron's deceptions and its bankruptcy
2002	Texas jury finds the audit firm of Arthur Andersen guilty of obstruction of justice for destroying documents during Security and Exchange Commission's investigation of Enron
2002	Sarbanes-Oxley Act is signed into law in July in response to numerous accounting scandals that led to bankruptcy filings of Enron, WorldCom and Global Crossing; corporate responsibility legislation provides tougher penalties for fraud and holds executives personally responsible for their corporate financial statements
2002	Overall discretionary spending caps expired on September 30 and the pay-as-you-go (PAYGO) requirement expired at year's end
2002	A majority of the states face budget shortfalls
2002	In March, the White House promoted proposed pension changes and partial privatization of Social Security as part of an overhaul of retirement financing
2002	On November 25, President Bush signed the "Homeland Security Act of 2002" that restructures the executive branch to meet the threat posed by terrorism by creating the cabinet-level Department of Homeland Security
2002	Budget Enforcement Act (BEA) expired on September 30 and the pay-as-you-go (PAYGO) requirement expired at the end of the year
2002	The budget deficit in FY 2002 is the first since 1998
2004	In a 7-2 decision in <i>Tennessee Student Assistance Corp. v. Hood</i> , the Supreme Court affirmed the decision of the US Court of Appeals for the Sixth Circuit and held that an adversary proceeding filed against a state entity was not barred by the doctrine of sovereign immunity
2004	OMB revised Circular A-11
2004	The GAO Human Capital Reform Act of 2004, Pub. L. 108-271, 118 Stat. 811 (2004), changed the GAO's legal name to the Government Accountability Office, decoupled GAO employees from the federal employee pay system and established a performance-based compensation system

parameters that practically and significantly affect the field; those publications that epitomize orthodox doctrine and traditional practices, including model legislation and authoritative statements defining professional standards; publications representing innovations in thought or practice that have been particularly influential intellectually or historically; and frequency of

reference—the “classics.”* These criteria of selection allow that a particular choice of inclusion or omission be mistaken, but not capricious or arbitrary.

B. CONTEXT

1. Public Administration

American budgeting and financial management have developed in tandem with the broader field of public administration. The context of the American administrative system is the combined legacy of Western political thought and a historically dynamic but stable system, the contours of which we bend to fit the times. We have adopted, adapted, rejected, and revised our interpretation of our history and experiences as we respond and adjust to change and integrate it into our polity and thinking. War, macroeconomic changes such as depression and global interdependencies, ideas such as scientific management and professional ideals, demographic change generating political and administrative demands, and technological advances from the telephone to computers—reflected in heightened administrative and analytical capacity (and speed!)—have spurred modifications in the system and in budget theory and practice.

2. Dynamism and Stability

Despite the importance—and drama—of change, an accurate portrayal also stresses those threads of continuity that tie the system and the field together over time and across the continent. Control is a significant concern that warrants separate treatment in some detail; so too is our developing understanding of the way in which decisions are made and a changing administrative and technological capacity. Yet another theme and, in this author’s view, the core of the American budgetary system, is continued reliance on a governmental structure built on democratic principles, a federal republic, checks and balances, and separation of powers. Consequently and notwithstanding the fact that it predates the emergence of the modern administrative era emphasized in this chapter, we turn initially to the US Constitution. As the central thematic, historical, and legal document of the system, it is a logical beginning to the history that appropriately serves as the backdrop to our current and still evolving system.

II. HISTORICAL ANTECEDENTS

A. U.S. CONSTITUTION

1. Hamiltonian Perspective

The US Constitution is an experiment that emerged from the inadequacies of the Articles of Confederation. Arguing on behalf of ratification by states in 1789, Alexander Hamilton explained his view of the budget issue and the Confederation’s lack of centralized resources and powers in *The Federalist Papers*. This source is a series of essays crucial to an understanding of the intent behind the Constitution and the political system based on it (Mosher 1976, 10; Rossiter 1961). Hamilton phrased the issue elegantly:

Money is, with propriety, considered as the vital principle of the body politic; as that which sustains its life and motion and enables it to perform its most essential functions. A complete power, therefore, to procure a regular and adequate supply of revenue, as far as the resources of the community will permit, may be regarded as an indispensable ingredient in every constitution. From a deficiency in this particular, one of two evils must ensue; either the people must be

* Several collections of the literature of public administration in general and public budgeting in particular are available, including Hyde and Shafritz (1978), Hyde (1992), Mosher (1976), Sharfritz and Hyde (1978, 1987), and Schick (1987).

subjected to continual plunder, as a substitute for a more eligible mode of supplying the public wants, or the government must sink into a fatal atrophy, and, in a short course of time, perish (*Federalist* No. 30).

Hamilton, later to become the first Secretary of the Treasury, further contributed the cogent observation that “in political arithmetic, two and two do not always make four” (*Federalist* No. 21).*

The American version of the colonial legacy, with conflict between the Crown and Parliament dating at least to the Magna Carta, developed in terms of the institutions and processes represented by and created through the Constitution. The machinery of government is built on checks and balances and separation of powers, and it is within the context of jealously guarded constitutional powers that executive–legislative prerogatives are played out. This theme endures and dominates: “The fundamental struggle over the budget is thus between the president and the Congress. The politics of the budget are dominated by the saga of that struggle” (Shuman 1984, 16).†

2. Article I and Amendments

Initially, budget and governmental economic powers rested wholly with Congress, which still retains the constitutional power to authorize spending through appropriations. Budgetary powers are enumerated in the Constitution as follows:

- Article I, Sec. 7:

All Bills for raising Revenue shall originate in the House of Representatives; but the Senate may propose or concur with Amendments as in other Bills...

- Article I, Sec. 8:

The Congress shall have the Power to lay and collect Taxes, Duties, Imports and Excise, to pay the Debts and provide for the common Defense and general Welfare of the United States; but all Duties, Imports and Excises shall be uniform throughout the United States;
To borrow Money on the credit of the United States;

To regulate Commerce with foreign Nations, and among the several States, and with the Indian Tribes;

To establish an uniform Rule of Naturalization, and uniform Laws on the subject of Bankruptcies throughout the United States;

To coin Money, regulate the Value thereof, and of foreign Coin, and fix the Standard of Weights and Measures;...

To raise and support Armies, but no Appropriation of Money to that Use shall be for a longer Term than two Years;....

To make all Laws which shall be necessary and proper for carrying into Execution the foregoing Powers, and all other Powers vested by this Constitution in the Government of the United States, or in any Department or Officer thereof.

* Before ascribing excessive authority to authoritative pronouncements, it may be worthwhile to note Hamilton’s preference for indirect taxation, especially duties, excises, and taxes on consumption, expressed in *Federalist* No. 12, and his prediction in No. 21 that indirect taxes “must always constitute the chief part of the revenue in this country.”

† Major budget reforms of 1921, 1974, 1985, and 1990, discussed in detail in this chapter, illustrate the continuing importance of executive–legislative relations and constitutional authority in the development of American budgeting and financial management.

- Article I, Sec. 9:

... No Capitation, or other direct, Tax shall be laid, unless in Proportion to the Census or Enumeration herein before directed to be taken. [See Sixteenth Amendment.]
No Tax or Duty shall be laid on Articles exported from any State....

No Money shall be drawn from the Treasury, but in Consequence of Appropriations made by Law; and a regular Statement and Account of the Receipts and Expenditures of all public Money shall be published from time to time....

- Amendment XIV, Sec. 4:

The validity of the public debt of the United States, authorized by law, including debts incurred for payment of pensions and bounties for services in suppressing insurrection or rebellion, shall not be questioned...[1868]

- Amendment XVI:

The Congress shall have power to lay and collect taxes on incomes, from whatever source derived, without apportionment among the several States, and without regard to any census or enumeration. [1913]

3. Treasury Department

One of the first steps under the new governmental arrangements was An Act to Establish the Treasury Department (1 Stat. 12 [1789]).* This created the rudimentary model or “basic elements of the federal financial system” (Mosher 1976, 8). The act also clearly articulated that system’s emphasis on control by establishing mechanisms that are, in principle, still relied on today, including the specific and detailed division of responsibilities among the Secretary of the Treasury, Comptroller, Auditor, Treasurer, Register, and Assistant to the Secretary; countersigning by the Comptroller of warrants drawn by the Secretary; a requirement that the Treasurer report to every session of Congress “a true and perfect account of the state of the Treasury”; and a prohibition of “conflict of interest” in Sec. 8, which states that “no person appointed to any office instituted by this act shall directly or indirectly be concerned or interested in carrying on the business of trade or commerce.” It was through his office as Secretary of the Treasury that Hamilton devised the strategy to manage the federal debt, which the Revolutionary War had pushed to over \$70 million by 1790 (Swan, in Rabin and Lynch 1983, 12); current observers can empathize with the problem, if not with the dollar figure.

By the end of the eighteenth century, therefore, some of the institutions and concerns that continue to play a vital role in the contemporary era were already in place. Congress temporarily established a Ways and Means Committee in 1796; it was to become permanent in 1802 (Smithies 1955, 51). The new Treasury Department was destined to become, over one and one-third centuries later, the first home of the new Bureau of the Budget. Annual appropriation acts under Secretary Hamilton amounted to a few lump-sum appropriations, with one appropriation covering Treasury warrants, another the civil list, a third the Department of War, and a fourth other expenditures in 1791–1794 (Smithies 1955, 50). But from 1795 on, the new machinery turned as it would during the next century; in another important respect, Congress exercised its constitutional powers and guarded against executive excess by voting detailed and usually nontransferable appropriations.

B. LEGISLATIVE BUDGETING OF THE NINETEENTH CENTURY

1. Imposition of Subnational Debt Limits

For some, a historical perspective may serve to blend and smooth events into of little more than an even flow time disturbed only by great events such as civil war. Nonetheless, the nineteenth century

* Basic documents in public budgeting are available in several collections, including Mosher (1976) and Stillman (1982).

was an era of change and turmoil, of the frontier, urban growth and squalor, labor unrest, and partisan excess, corruption, and bossism. It was punctuated by significant developments in public financial arrangements (see Table 5.1), such as the state financing of major public works that ultimately led to debt limits.

In the 1820s, a great drive was undertaken to provide internal improvements for the expansion of the economic infrastructure of the states by providing financial institution and transportation links.... States actively borrowed to finance canals, banks, railroads, roads, and other ventures.... Debts began to grow very rapidly.... In theory, the borrowings were to be repaid from income derived on the investments rather than from tax levies. The building boom, however, led to gross overinvestment in projects, and outright fraud was common.... The borrowing bubble burst in the panic of 1837.... To avoid future excesses, soothe taxpayer frustrations, and restore investor confidence in their bonds, constitutional limits on debt were imposed at the state level.... Such impediments to borrowing still exist (Bennett and DiLorenzo 1983, 13–15).

The pattern was repeated during the post-Civil War era by local governments, for which indebtedness climbed from \$151 million in 1860 to \$900 million by 1890 (Friedman 1985, 528). The result was that states then moved to clamp restrictions on local borrowing (Moak and Hillhouse 1975, 262). These developments affecting state and local finances were all the more important because of these governments' role in the system; measured by both number of employees and percentage of government spending, they dominated the US system during this period.

2. Congressional Domination of Federal Budgeting

At the federal level, “during the nineteenth century, except for short period of war, Congress dominated the American government and its budget and budget procedures” (Shuman 1984, 17–18). That domination was exercised throughout the nineteenth century by the use of detailed appropriations, largely nontransferable among accounts. Furthermore, until after World War I, all of this operated against the background of a system in which agencies prepared their estimates and transmitted them through the Treasury Department to Congress; with the president bypassed, there was no overall governmental plan. In the words of one authority on the subject, “It is important to note that from 1789 to 1884 the Congress in legislation was primarily concerned with the legality of expenditures rather than with an understandable record of what was bought with the money spent” (Smithies 1955, 63). Thus it developed that “when the Congress wishes to assert its authority over the Executive, it returns to restrictions on the use of appropriations with unvarying monotony” (Smithies 1955, 49).

3. Appropriations Process

While legislative–executive tensions, moves, and countermoves tell some of the story, much was going on within Congress, the dominant branch, that spoke of continuing adjustments in budgetary procedures and powers. The two-step, authorization–appropriation process began in the House of Representatives in 1837, and in 1850 in the Senate (Shuman 1984, 57); separate appropriations committees were established, first in the House in 1865 and in the Senate two years later (although authority over important appropriations would go to substantive committees 20 years later). Jurisdiction over credit issues shifted from the Ways and Means Committee to the Banking and Currency Committee in 1865. This period is marked, too, by some of the notorious budgetary practices that are familiar to contemporary observers of the Potomac scene, such as the handling of substantive matters in financial bills. For example, in response to the abuses associated with the Grant administration, Congress established the first Civil Service Commission as a rider to an appropriations bill in 1871.

For a synoptic description of the nineteenth-century appropriations process that proceeded without an overall plan or executive orchestration, we turn to the 1912 Report of the

Taft Commission, according to which:

in the United States the Book of Estimates, our nearest approach to a budget, is rather a more or less well-digested mass of information submitted by agents of the Legislature to the Legislature for the consideration of legislative committees to enable the Legislature both to originate and to determine the policy which is to be carried out by the Executive during the budgetary period.

These, then, are the terms on which we meet the modern era of budgeting and financial management.

III. THE EMERGENCE OF THE MODERN ERA

A. CONTINUITY AND DISJUNCTURE

1. Changing Role of Government

The modern era in American budgeting and financial management is characterized by several significant changes which reflect developments in the larger polity. Perhaps foremost among these is the changing role of government itself. In the twentieth century, the public sector has been subjected to systemic pressures, such as the severe economic dislocation and political threat of the Great Depression, global wars, and civil unrest in an interdependent urban society. The response, broadly defined, has been a shift from a relatively minor, sometimes even residual forum to an integral part of the socioeconomic system. The patterns of growth and change can be succinctly summarized by the fact that, whereas total government expenditures accounted for one-tenth of the nation's gross national product in 1929, that percentage has increased to the point at which, over one-half century later, total government spending amounts to approximately one-third of the country's economic activity.*

The broad pattern of growth masks or ignores other significant trends, not least of which is the turnabout in the relative weights of the various governmental levels that constitute the federal system. The national level came to dominate the system in terms of spending. Whereas employment has been relatively stable in percentage terms, with local governments accounting for approximately three-fifths of civilian government employees over the last half century, local governments fell from first to last among the three predominant governmental levels in terms of own-source expenditures. The financial dependency implied by this change is underscored by the importance of intergovernmental transfers and aid programs. One study pinpoints intergovernmental constraints and "fiscal atrophy" as among the dominant features of municipal budgeting (Friedman 1980); similarly, but in different language, another source identifies poverty and certainty as the two features of municipal budgeting (Wildavsky 1975, 114–135). Speaking directly to the continued salience of these same trends, attention shifted from an emphasis on retrenchment in the early years of the 1980s (Burchell and Listokin 1981; Carr 1984; Clark and Ferguson 1983; Levine 1980; Levine et al. 1981; Rubin 1979) to studies of the impact of changes in federal policies and funding (Nathan 1983; Palmer and Sawhill 1982).† More conflict, new rules, and probably different winners were forecast (Caiden 1981) and subsequent developments bore out these predictions (Gold 1995b;

* The patterns of growth and change are summarized in the statistics available in indispensable periodical statistical sources such as the compendia of federal, state, and local financial data from the Bureau of the Census of the US Department of Commerce.

† Demographic change (Peterson 1976), tax policy (Samuelson 1969; Tiebout 1956), and variations in expenditures related to political culture (Morris 1980; Wilson and Banfield 1958) or government structure (Lineberry and Fowler, 1967), as well as routine political and administrative decision making (Crecine 1969; Levy et al. 1974; Lineberry 1977; Meltsner 1971; and, with respect to the states, Bingham et al. 1978, 193–211; Sharkansky 1970, 13) are also among the independent variables associated with changes in subnational and especially municipal finance. For studies of the impact of intergovernmental transfers and policies (e.g., state constraints), see reference citations including Aronson and Hilley (1986); Bahl (1981); Bingham et al. (1978, 55–70); CBO (1983); Friedman (1980); Gold (1995b); Sbragia (1983), and Walker (1995).

Walker 1995). Practitioner and scholarly studies of state and local budgeting encompass procedural variations, federal aid, political and socioeconomic variables, state policies, mandates and other legal constraints, fiscal stress, the effects of recession, and more.*

2. Shifts in Federal Budgeting

As the federal level of government has come to dominate governmental budgeting (measured in standard terms as percentage of total government spending), the executive has come to dominate the federal process. In point of fact, the move to executive budgeting characterizes budgeting at all levels of government in the modern era; for example, Ohio adopted executive budgeting a decade before Washington. Illustrating the importance of a systemic perspective, the impetus behind executive budgeting can frequently be traced to the municipal reform agenda of the Progressive Era, as well as to the developing sophistication of public administration and administrative capacity. Nonetheless, the shift at the federal level is vitally important to an understanding of the literature and history of the field.

The modern era in public administration was ushered in, according to academic consensus, by the publication in 1887 of Woodrow Wilson's article "The Study of Administration" (Wilson 1887). While it is important to note that the budget function was not specifically discussed, Wilson's remarks on public opinion and his conclusions that "principles on which to base a science of administration for America must be principles which have democratic policy very much at heart," and that "our duty is to supply the best possible life to a *federal* organization, to systems within systems," underscore the continuities (such as constitutionalism, federalism, accountability and control) that connect the modern administrative era with its predecessor. (It is ironic that later, as president, Woodrow Wilson would veto an early version of what can be described without hyperbole as one of the major reforms and documents in US history, the Budget and Accounting Act of 1921.)

B. TO EXECUTIVE BUDGETING IN SLOW MOTION

1. Municipal Sources of Executive Budgeting

Public budgeting and financial management in the twentieth century is largely a story of executive–legislative relations, efforts to control government spending and curb corruption and abuse, intergovernmental relations, and changing ideas and technology in administration. These all came together in the early years of the century in the move toward executive budgeting and other governmental reforms. One important source of reform, the National Municipal League, a nongovernmental organization with the explicit purpose of governmental reform, was organized in the decade that saw publication of Wilson's article. The league's second Model City Charter of 1916 called for strict separation between policy (council) and administration (city manager) and an executive budget, to wit, from Section 36 of the Annual Budget:

The city manager shall prepare and submit to the council the annual budget after receiving estimates made by the directors of the departments [Sec. 37 creates six administrative departments, one of which is finance; Sec. 51 calls for uniform classification] (Mosher 1976, 82–89).

* Among the innumerable sources on state practices and problems are the publications listed in Table 5.2; the US Advisory Commission on Intergovernmental Relations (defunct for about a decade); National Association of State Budget Officers; National Conference of State Legislatures; Cranford 1992; Eckl et al. 1993; GAO 1992b, 1993a, 1993b; Gold 1995a, 1995b; Gold and McCormick 1994; Lee 1991; Mackey 1993; Public Budgeting and Financial Management 1993; Snell 1993; Thompson 1993; and Walker 1995. In a highly selective listing of the extensive literature on municipal budgeting, see publications of the Government Finance Officers Association, International City/County Association; specialized journals such as *Urban Affairs Quarterly* and *Municipal Finance*; Bland and Nunn 1992; Botner 1989; Cope 1992; Dearborn et al. 1992; Forrester and Mullins 1992; Glick 1986; Gold and Ritchie 1994; Kantor and David 1992; Lewis 1994; MacManus et al. 1989; O'Toole and Marshall 1987; Rubin 1993; and Strachota 1994.

New York City's Bureau of Municipal Research, probably the best known of its type, was originally founded in 1906 under articles of incorporation that explicitly defined its values as efficient and economic government; these values, along with standardization and "professionalization," like the reforms that were to ensure their vitality, came to dominate the ensuing period in public administration. Perhaps the new catechism was most evident in the push toward reform in public budgeting and financial management, in the research, training, and practice of which the bureau had a determining influence (Dahlberg 1966).*

2. Taft Commission

While the idea of a single, comprehensive budget plan routinely and uniformly formulated by the executive and submitted for legislative review and appropriation emerged primarily from the urban arena—this was the muckracker's era of scandal, corruption, excesses, and abuses—the idea readily took root at the other government levels. President Taft established the Commission on Economy and Efficiency in 1910, and the 1912 report of the Taft Commission broke with the precedent of four congressional committees examining administrative issues between the Civil War and the turn of the century. It "endorsed the concept of Presidential responsibility for administration" (Mosher 1976, 49), a budget bureau reporting to the president along with staff and an executive budget, and uniform, object classification in all federal departments.† The 1912 report of the Taft Commission redefined the budget and its purpose in these words:

As used in this report the budget is considered as a proposal to be prepared by the administration and submitted to the legislature. The use of a budget would require that there be a complete reversal of procedure by the Government—that the executive branch submit a statement to the Legislature which would be its account of stewardship as well as its proposals for the future. A national budget thus prepared and presented would serve the purposes of a prospectus. Its aim would be to present in summary form the facts necessary to shape the policy of the Government as well as to provide financial support.

Despite the congressional failure to immediately embrace the commission's recommendations, President Taft attempted to act on the new ideas. In 1911, he distributed centralized forms to department heads for reclassifying the data in estimate preparation. He even went so far as to submit an executive-type budget to Congress, which responded by referring it to the Appropriations Committee, "and there it lay without consideration, action, or report" (Cleveland 1915, 28).

3. Apportionment

The Taft Commission's report was not issued in isolation, but in a context supported by several other significant events of the period. The Antideficiency Act of 1906 (34 Stat. L. 40) pointed to the continuing interest in and recognized need for planning and control in budgeting and financial management. In a major departure from past practice, it provided for apportionment to combat the

* An early and influential text—cited in V. O. Key, Jr.'s 1940 article, for example—on public budgeting was written by a bureau staff member, A. E. Buck (1929).

† The members of the first comprehensive commission on national budgeting in the United States are a list of luminaries in the field and include Frederick A. Cleveland, commission chairman and director of the Bureau of Municipal Research; Frank J. Goodnow, a professor of administrative law at Columbia University who went on to the presidency of Johns Hopkins University; William F. Willoughby, whose varied career in government service ultimately saw him as constitutional advisor to the ill-fated Chinese Republic; Walter W. Warwick; and Merritt O. Chance. In light of the administration-versus-politics debate that was to mark the developmental phase of public administration as a field of inquiry, it is worthwhile noting that Woodrow Wilson, Frank Goodnow, W. F. Willoughby, Charles Merriam, Charles Beard, and Luther Gulick contributed to the practice and literature of public budgeting and became presidents of the American Political Science Association as well.

use of deficiency appropriations. According to the Act, appropriations “shall... be so apportioned by monthly or other allotments as to prevent expenditures in one portion of the year which may necessitate deficiency or additional appropriations ...” (in Smithies 1955, 56–57).*

4. Initial Steps toward Delegating Authority

The first congressional delegation of considerable power over the federal budget and national economy occurred in 1913, when Congress passed the Federal Reserve Act. Congress delegated power not to the president but to a regulatory agency and thereby established a “quasiprivate, quasipublic institution which the Federal Reserve Act made independent of the president but an agent of Congress” (Shuman 1984, 18). Yet another example is the passage of the two Liberty Bond Acts (1917), which gave the Treasury Department authority to pay debts and borrow money on the credit of the United States to a specified amount or “debt ceiling”; amendments to the second Liberty Bond Act of 1917 are still used to increase the debt limit. These congressional acts began the overall pattern that is to be identified as a hallmark of modern budgeting, that is

In the twentieth century there has been a steady delegation by Congress of its power over the budget to the president. This has ordinarily not been the result of conspiracy or usurpation but of deliberate delegation, atrophy, or shunning of power by Congress (Shuman 1984, 17–18).

What, then, are the reasons? In the words of one answer, “Each act and each, transfer of power was preceded by economic problems, panics, wars, depression, or constitutional crisis” (Shuman 1984, 20). In sum, external or environmental factors press in on the system and force adaptive responses.

5. Influence of Public Administration

The development and refinement of innovative ideas were—and are—an important part of that environment. Frederick W. Taylor gave testimony on “scientific management” before the US House of Representatives on January 25, 1912. A few years later, in 1915, the American Academy of Political and Social Science published a landmark volume entitled *Public Budgets*. It contributed a coherent statement by leading academics and practitioners in support of an analytical, systematic, executive approach to budgeting; its scope is national (California, Massachusetts, New York, Illinois, Cleveland, New York City, Chicago) and comparative (Germany, France, England), and its list of authors and represented organizations reads like a ‘who’s who’ in the new field of public administration; it includes Frederick A. Cleveland, chairman of the 1912 Taft Commission and director of the Bureau of Municipal Research, Charles A. Beard, the Columbia University professor, and the renowned University of Chicago professor and member of Chicago’s city council, Charles E. Merriam.

In “Evolution of the Budget Idea in the United States,” one of the foremost classics in the field, Cleveland discusses the Taft Commission, his ideas on administration, and the executive budget. In words with a contemporary ring, he describes a budget as “a plan for financing an enterprise or government during a definite period, which is prepared and submitted by a responsible executive to a representative body (or other duly constituted agent) whose approval and authorization are necessary before the plan may be executed” (Cleveland 1915, 15). He further clarifies what he means by a budget as a “plan of financing”: Every year in every jurisdiction we have had “estimates” of both revenues and expenditures. But estimates in themselves do not constitute a budget.

* Apportionment, a recognized, standard building block of preaudit financial controls, became the responsibility of the Bureau of the Budget in 1933. On apportionment, see Fisher (1975, 38–40) and GAO’s glossary (1981, 34).

They only serve the purpose of laying the foundation for work plans and financial plans (Cleveland 1915, 16).

Another contribution in that same volume is Rider's partially annotated, selective bibliography, which combines "the most important material" from academic and practitioner sources (Rider 1915, 277–287). Its references describe a field already taking shape, and include the *American Political Science Review*, which would remain a preeminent journal in the field (as would the *Journal of Accountancy*, responsible for many citations in Rider's bibliography); and contributions by members of the Taft Commission. Over the ensuing years, the leading circle of thinkers, writers, and doers would broaden, additional works would be added to the list of acknowledged classics in the literature, and the pace of publication would pick up, but these were to remain names recognized and admired by students, practitioners, and scholars for three-quarters of a century and still counting.

And the pace of publication did pick up. A straight count of published articles is surely a gross, oversimplified, and fully non-qualitative tool, but it does provide a sense of the quantity and timing of publications. One index of journal articles published from 1886 to 1974 shows only a little more than one-fifth of all the articles concerning budgeting* cited as published in the first five decades (1886–1935) and almost four-fifths as published in the next 38 years (1936–1974). Moreover, over two-thirds of the citations are dated in the postwar period, 1946 to 1974. A total of 218 sources are noted for 1886 to 1974 (Wile 1978). Another index (and because of different coverage and citation methods that general different results on counts, not comparable with the first) shows a total of 476 articles published from 1975 to 1985, meaning that this decade alone witnessed a minimum annual average of forty-three journal additions to the literature and the field (see Table 5.2.)

C. THE 1921 REFORM

The report of the Taft Commission and several other important events and publications of this period built to a crescendo within a few years. What resulted is second only to the US Constitution in importance to contemporary public budgeting at the federal level (even considering subsequent acts and modifications), and is usually awarded a singular place in US administrative history. After Woodrow Wilson's earlier veto on constitutional grounds,† Congress passed and President Harding signed the Budget and Accounting Act of 1921 (42 Stat. 18). Authoritative documents emanating from the institutions founded by the act stress its importance.

The budget system of the Federal Government rests on the Budget and Accounting Act, approved June 10, 1921. This act is a milestone on the road to effective public management in the United States. As the foundation of budgetary planning and control, the act not only fostered responsible determination of the Government's financial needs, but also committed the executive branch to a higher standard of administration in all its activities.

"For the accomplishment of both ends, full responsibility was vested in the President. What is more, he was also equipped to discharge this responsibility" (OMB/BOB 1958, 1). "The basic purposes of this act were to provide for an independent review of executive expenditures and to fill the need for a national budget system" (General Accounting Office (GAO, now Government Accountability Office) 1965, 1-1).

* Citations are limited to those in categories budget, budgetary, budgeting, budgets, and bureau of budgets to minimize double counting of entries under multiple categories.

† Wilson's objection about the power to remove the comptroller general would arise again 65 years later in litigation over the constitutionality of provisions of the Balanced Budget and Emergency Deficit Control Act of 1985, popularly referred to under the name of its sponsors, Gramm-Rudman-Hollings.

1. New Institutions

The Act established the Bureau of the Budget (BOB), a new staff office in the Treasury Department, which would develop into one of the true centers of power in the government in Washington.* The staff and informational base of the budget function was extended dramatically (see Figure 5.1). The act required that a budget officer be appointed in each department; that BOB have access to departmental information, records, and books; and that BOB be obligated to respond to requests for information from congressional revenue and appropriations committees. According to Sec. 207,

The Bureau, under such rules and regulations as the President may prescribe, shall prepare for him the Budget, the alternative Budget, and any supplemental or deficiency estimates, and to this end shall have authority to assemble, correlate, revise, reduce, or increase the estimates of the several departments or establishments.

Counterbalancing the newly authorized staff capacity for the executive branch, the same act created a new congressional office that was “independent of the executive departments” (Sec. 301) and responsible for oversight (audit) functions. Title III established the Government Accountability Office (GAO), headed by the comptroller general, who was appointed by the president with Congress’s advice and consent for a single, fixed term of 15 years and subject to removal only by joint resolution of Congress. (The comptroller was thereby removed from Treasury, where it had been since 1789.) The GAO was to perform basic audit functions (e.g., certify balances), and the comptroller general, in the language of Sec. 309, was to “prescribe forms, systems, and procedures for administrative appropriation and fund accounting in the several departments and establishments, and for the administrative examination of fiscal officers’ account and claims against the United States.” According to the GAO,

The authority and responsibility of the General Accounting Office for making audits and investigations of Government agencies are stated in a number of laws. The Budget and Accounting Act, 1921, which created the General Accounting Office, vested in it all the powers and duties of the six auditors and the

*The BOB was transferred to the Executive Office of the President in 1939 and renamed the Office of Management and Budget in 1970. For a history of this agency, see Berman (1979), Congressional Research Service (CRS, 1986), LeLoup (1986, 95–119); Mosher (1984), and BOB’s 1958 staff orientation manual (now OMB). For one person’s view of the agency and its director’s contemporary impact, see Stockman (1986); another personal history is told in McOmber (1981, 78–84); and for a collection of perspectives from numerous sources, see Schick (1980, 134–192).

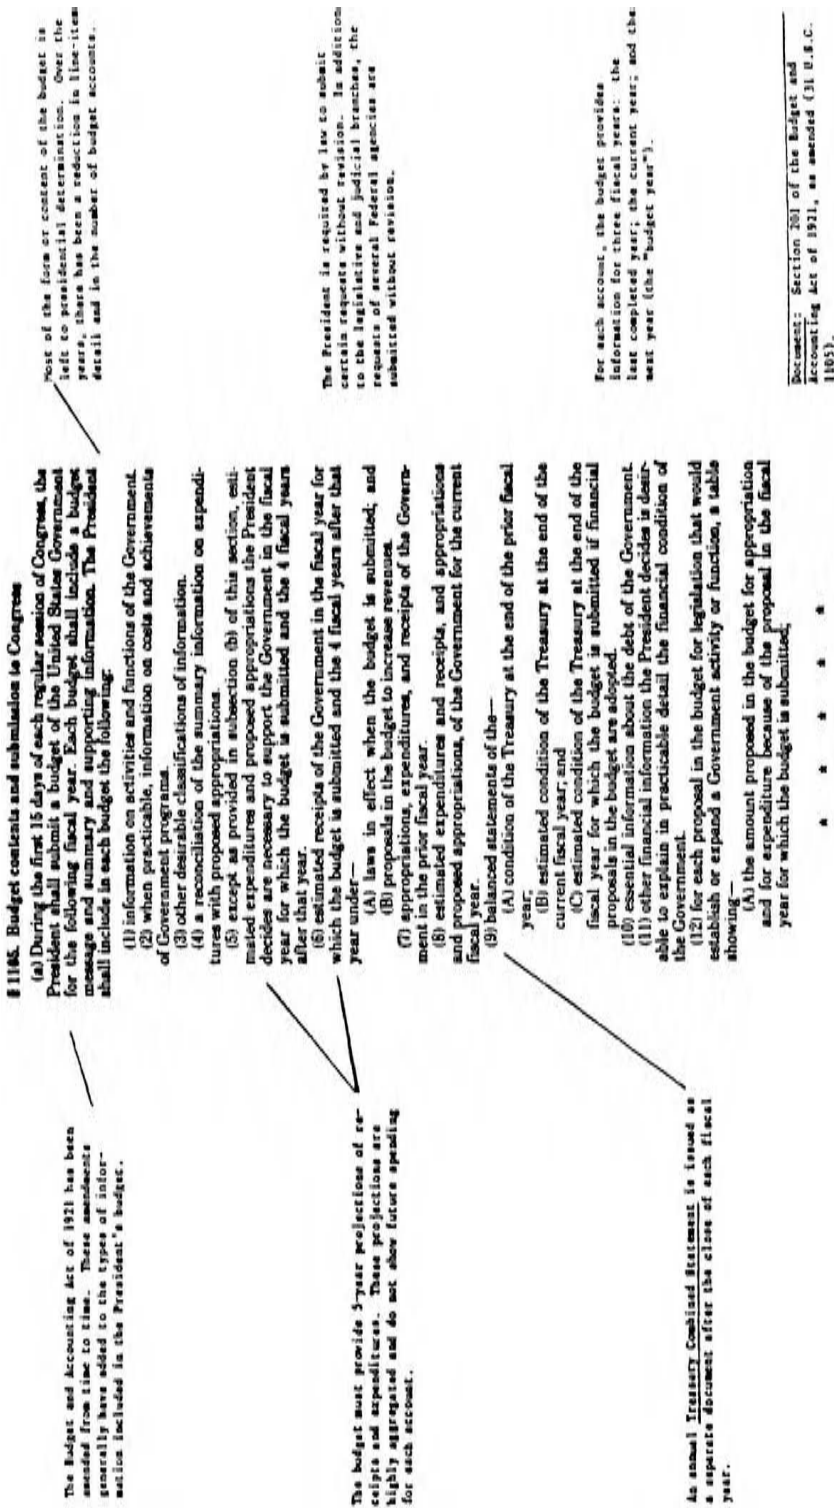

FIGURE 5.1 The Budget and Accounting Act of 1921. (From Schick, A. and Keith R., *Manual on the Federal Budget Process*, Congressional Research Service, Library of Congress, Washington, DC, 23, 1982.)

Comptroller of the Treasury as stated in the Dockery Act of July 31, 1894, and other statutes extending back to the original Treasury Act of September 2, 1789, as well as new duties. Since the passage of the organic act creating the General Accounting Office under the control and direction of the Comptroller General of the United States, the scope of its activities has been widened through subsequent legislation (including the Budget and Auditing Act of 1950, clarifying existing audit authority in Sec. 117[a]) (General Accounting Office 1965 revised, 1-1).

2. Institutional Issues

These arrangements for enhanced, executive staff capacity and congressional oversight made eminently good sense in light of the increasing scope and complexity of the government and the increasing budget numbers reflecting that development. Executive budgeting, with its centralized procedures, technical analyses, coordinated timetables, and consolidated figures, depends on central staff, just as the growth in staff awaited executive decision making in a complex environment. The two go hand in hand. Development of administrative capacity is so influential that it is identified as one of the basic elements useful for delineating budget systems or patterns (Caiden 1978).

The creation of the BOB and GAO also institutionalized one of the important sources of continuing tension between professionalism and expertise on the one hand and political accountability and responsiveness on the other, a tension that is probably inherent in the modern system and that speaks to the intimate connection between the budget function and public administration more generally. As expressed by a senior budget official, “It is the president’s budget.... To have been steeped in this philosophy from the beginning of our institutional lives—to always be conscious of that ‘office across the street’—is the paramount factor of our working lives” (McOmber 1981, 79). The excerpt from Office of Management and Budget 1994, illustrates that the tension generates important ‘rules of the game’ in contemporary budgeting (see Figure 5.2).

3. Executive Budgeting—Title II

The BOB and GAO were the institutional components of a historical turnaround in the federal budget process—from legislative budgeting to authorization of an executive budget under the aegis of the president, as enacted in Title II—The Budget:

- Section 201:

The President shall transmit to Congress on the first day of each regular session, the Budget, which shall set forth in summary and in detail:

- (a) Estimates of the expenditures and appropriations necessary in his judgment for the support of the Government for the ensuing fiscal year...;
- (b) His estimates of the receipts of the Government...;
- (c) The amount of annual, permanent, or other appropriations...;
- (d) Balanced statements...;
- (e) All essential facts regarding the bonded and other indebtedness of the government; and
- (f) Such other financial statements and data as in his opinion are necessary or desirable to make known in all practicable detail the financial conditions of the Government.*

* For “Evolution of Budget Concepts in the President’s Message: 1923–1968,” see R. W. Johnson in President’s Commission on Budget Concepts (1967, 93–103).

12.9. Responsibilities for disclosure with respect to the budget.
(a) Agency testimony before and communications with Congress on budgetary matters.--

The nature and amounts of the President's decisions are confidential and will not be released until the budget is transmitted formally to Congress. The executive branch communications that have led to the budget will not be disclosed either by the agencies or by those who have prepared the budget. . . .

Following formal transmittal of the budget, an amendment, or a supplemental appropriation request, agency representatives will be guided by the following policies pertaining to budgetary matters when testifying before any congressional committee or communicating with Members of Congress:

(1) Witnesses will give frank and complete answers to all questions.

(2) Witnesses will avoid volunteering personal opinions that reflect positions inconsistent with the program or appropriations request the President has transmitted to Congress.

(3) If statutory provisions exist for the direct submission of agency budget estimates to Congress, OMB may provide agencies with additional materials supporting the President's budget request to be forwarded by the agency to Congress with agency testimony. Witnesses for such agencies will be prepared to explain the agency submission, the request in the President's budget, and any justification material.

(4) In responding to specific questions on program and appropriations requests, witnesses will refrain from providing the agency request to OMB as well as plans for the use of appropriations that exceed the President's request. Witnesses typically bear responsibility for the conduct of one or a few programs, whereas the President must weigh carefully all of the needs of the Federal Government, and compare them against each other and against the revenues available to meet such needs. Where appropriate witnesses should call attention to this difference in scope of responsibility in explaining why it is not proper to them to support efforts to raise appropriations above the amounts requested by the President. . . .

(b) Clearance of budget-related materials for Congress and the media.--Policy consistency is essential among the various sections of the President's budget, and the budget-related materials prepared by the agencies for Congress and the media. Agencies are responsible for ensuring that these budget-related materials are consistent with the President's budget and are submitted for clearance to OMB, unless a specific exemption from clearance is approved by OMB.

Agencies will submit all proposed budget justification materials to OMB for clearance prior to transmittal to congressional committees or individual Members of Congress or their staff.

Agencies also will submit to OMB for clearance budget-related oversight materials. . . .

FIGURE 5.2 Rules of the Game (Exert from OMB circular A-11, Preparation, Submission, and Execution of the Budget, rev. July 2004 (<http://www.whitehouse.gov/omb/circulars/a11/04toc.html>)).

- Section 202 (a):

... The President in the Budget shall make recommendations to Congress for new taxes, loans, or other appropriate action to meet the estimated deficiency.

- Section 206:

No estimate or request for an appropriation and no request for an increase in an item of any such estimate or request, and no recommendation as to how the revenue needs of the Government should be met, shall be submitted to Congress or any committee thereof by any officer or employee of any department or establishment, unless at the request of either House of Congress.

4. Meaning of Budget Reform

New institutions, new information, and a different process for formulation made significant changes in the system. Had they not, there would have been no point in effecting the change. As Aaron Wildavsky explains in an influential examination of budget reform forty years later, "A large part of the literature on budgeting in the United States is concerned with reform... any effective change in budgetary relationships must necessarily alter the outcomes of the budgetary process. Otherwise

why bother?" He goes on to point out that "no significant change can be made in the budgetary process without affecting the political process" (Wildavsky 1961, 183–190).

5. Continuities

Some fundamental features of the budget process were not wiped away by this or later changes. Domination of the budget process continues to translate into an important source of power. Constitutionally authorized appropriations still characterize the process (see Figure 5.3 and Figure 5.4.). In sum, the 1921 act

created the major statutory basis for executive domination of the federal budgetary process. By authorizing the president and his budget director to compile a budget for all federal agencies except Congress and the Supreme Court, the act ensured that a president bent on domination had an important basis of power. Congress assumed that because it retained full authority to increase or decrease estimates, this did not constitute a surrender of power.... That assumption was proven erroneous in the following decades (Duncombe and Heffron, in Rabin and Lynch 1983, 419).

D. THE INFORMATION INDUSTRY

1. OMB and GAO Data and Documents

For students of federal budgeting as well as participants, the 1921 act's creation of two agencies devoted at least in part to nonpartisan analysis and research produced a steady stream of documents and publications that have been widely used and are considered highly reliable. Perhaps foremost among the Office of Management and Budget's (OMB, previously BOB) contributions is the president's budget request itself.* *The Budget in Brief* and its more detailed companion, *Special Analyses, Budget of the United States* (OMB, annual), are annual publications used in the legislature, media, and classroom (see Table 5.3.). To this abbreviated list should be added OMB's circulars detailing regulations and procedures (for example, Office of Management and Budget 1986a, b, 1994a, b, 2004), data collections, and individual studies and reports. The OMB generates the sophisticated graphics that frequently appear in presidential speeches and media reports. The task of coordinating federal statistical and fact-collecting services was assigned the director by virtue of the Federal Reports Act of 1942.

The GAO is also a prodigious source of data and documents. In keeping with its role as the federal audit agency, the GAO monitors and reports on regulatory and statutory compliance of other agencies and submits its own statutorily required reports. Covering management studies, cost analyses, budget studies, and more, the GAO's reports range from budget and management concerns, such as training, inventory, assets, and pension administration, to substantive issues, such as environmental protection, foreign aid, and national security.† There are publications of more general interest, including the useful and much-quoted *Glossary of Terms Used in the Federal Budget Process*. This source defines many potentially confusing aspects of the federal process. For example, "budget authority" is defined as

[authority] provided by law to enter into obligations that will result in immediate or future outlays involving Federal Government funds, except that budget authority does not include authority to insure

* For an introduction to the mystifying documents known as the US budget, see especially Collender (1984–1998, 2000, and 2003).

† With respect to budgeting and financial management, GAO also produces many case studies, other sources of which include Harvard's Case Clearinghouse, Lewis and Walker (1984), and the Office of Personnel Management's training materials (1986).

Public Law 97-102

This is one of the 13 regular appropriation bills. The appropriation bills are structured by Federal agency, and each bill has its own appropriations subcommittee.

As it enacted by the Senate and House of Representatives of the United States of America in Congress assembled: That the following sums are appropriated, out of any money in the Treasury not otherwise appropriated, for the Department of Transportation and related agencies for the fiscal year ending September 30, 1982, and for other purposes, namely:

The enacting clause of each appropriation specifies the fiscal year for which the appropriation is made. Unless otherwise provided, the funds in the bill are available for obligation only in that fiscal year.

TITLE I—DEPARTMENT OF TRANSPORTATION

OFFICE OF THE SECRETARY

SALARIES AND EXPENSES

This is a "long-term" appropriation for the office of the Secretary. Similar "salaries and expense" appropriations are made for most organizational units in Federal departments. The "set to exceed" language (sometimes called "sunsetting") is a limitation on the amount that can be spent on a particular purpose.

For necessary expenses of the Office of the Secretary of Transportation, including not to exceed \$27,000 for allocation within the Department of official reception and representation expenses as the Secretary may determine, \$38,100,000: Provided, That none of the funds in this Act shall be available for the execution of the sale or transference of any Government-owned securities of the Consolidated Rail Corporation without the prior consent of the House and Senate Committees on Appropriations.

Since it does not mention its duration, this is an annual appropriation, available only for the fiscal year specified in the enacting clause.

TRANSPORTATION PLANNING, RESEARCH, AND DEVELOPMENT

Each account (for a designated organizational unit or activity) has its own appropriation and funds appropriated for one cannot be used for any other account unless Congress grants transfer authority.

For necessary expenses for conducting transportation planning, research, and development activities, including the collection of national transportation statistics, to remain available until expended, \$1,250,000.

When funds "remain available until expended", it is a "no-year appropriation" and is not restricted to a single fiscal year.

Account: Public Law 97-102 (December 23, 1981), Department of Transportation Appropriation Act, Fiscal Year 1982.

FIGURE 5.3 Regular appropriation bills. (From Schick, A. and Keith R., *Manual on the Federal Budget Process*, Congressional Research Service, Library of Congress, Washington, DC, 1982, 50–51.)

PUBLIC LAW 97-102

URBAN MASS TRANSPORTATION ADMINISTRATION

Annual Appropriation

This appropriation allocates the total amount for three purposes. The earmarked amounts are the amounts available for each of the designated purposes. But the "not to exceed" appropriation of \$1 million for managerial training means that a portion of this amount can be used for the two other purposes.

For necessary expenses for research and training, as authorized by the Urban Mass Transportation Act of 1964, as amended (49 U.S.C. 1601 et seq.), to remain available until expended, \$61,500,000: Provided, That \$53,500,000 shall be available for research, development, and demonstrations, \$2,000,000 shall be available for university research and training and not to exceed \$1,000,000 shall be available for managerial training as authorized under the authority of said Act.

* * * * *
For necessary expenses for urban discretionary grants (including section 21) as authorized by the Urban Mass Transportation Act of 1964, as amended (49 U.S.C. 1601 et seq.), to remain available until September 30, 1985, \$1,479,000,000, together with \$11,000,000 to be derived from the appropriation "Rail service operating payments":

* * * * *

For payment to the urban mass transportation fund, for liquidation of contractual obligations incurred under authority of the Urban Mass Transportation Act of 1964, as amended (49 U.S.C. 1601 et seq.), and 23 U.S.C. 1432(c) and of obligations incurred for projects submitted for Interstate System segments withdrawn prior to enactment of the Federal-Aid Highway Act of 1976, \$1,200,000,000, to remain available until expended:

* * * * *

For payment to the Corporation for Public Broadcasting, as authorized by the Communications Act of 1934 as amended, an amount which shall be available within limitations specified by said Act, for the fiscal year 1984, \$110,000,000:

Advance Appropriation

An advance appropriation is different from "forward funding." The latter is an appropriation whose funds are available before the start of the fiscal year for which the appropriation is made.

An advance appropriation is made for one or more years beyond the current or next fiscal year. In this illustration, an appropriation bill for the 1982 fiscal year contained an appropriation to the Corporation for Public Broadcasting for the 1984 fiscal year.

Transfer

Transfers are funds shifted from one appropriation account to another. In this case, the transfer is specified in the appropriation act, but sometimes authority is given to executive officials to transfer a portion of an appropriation.

Liquidating Appropriation

When an appropriation is to pay an existing contract or obligation, it is termed a "liquidating appropriation" and is not covered as budget authority. The budget authority was provided when Congress authorized the obligation.

Documents: Public Law 97-102 (December 31, 1981), Department of Transportation Appropriation Act, Fiscal Year 1982; and H.R. 4360 (97th Cong.), Labor-Health-Education Appropriation Act, Fiscal Year 1982.

FIGURE 5.3 (Continued)

This exhibit provides an illustration of the final reports of budget execution for an annual appropriation of \$200,000,000. The appropriation expires on September 30, 1994 and is canceled on September 30, 1999. Each column represents a report for a succeeding fiscal year. Appropriate S.F. 133 line numbers are denoted in parentheses ().

Column 1. Final end-of-year S.F. 133 that is submitted to OMB for the period ending September 30, 1994. In FY 1994, actual disbursements of \$199,760,000 were made (outlays, line 14). \$110,000 in unobligated balances (line 9.A) and \$130,000 in obligated balances (line 13.C) remained when the appropriation expired. Unobligated balances are listed on line 9.A in the year an appropriation expires to show that balances are available for obligation before the account expired.

Column 2. Final end-of-year S.F. 133 that is submitted to OMB for the period ending September 30, 1995. In FY 1995, \$110,000 in expired unobligated balances (line 2.A) were carried forward from FY 1994 (column 1, line 9.A). During FY 1995, the year-end unobligated balance increased from \$110,000 to \$140,000 (line 10.E). The \$30,000 increase resulted from the collection of \$18,000 in refunds (line 3.A) and a \$12,000 recovery of a prior year obligation from the downward adjustment of a contract (line 4.A), which was obligated for \$80,000, but only cost \$68,000. The initial obligated balance of \$130,000 (line 13.A) decreased by \$68,000 for the payment of the contract obligation and \$12,000 for the downward adjustment that was reclassified as an unobligated balance.

The year-end obligated balance was \$50,000. Total disbursements were \$68,000, but net outlays were \$50,000 (line 14), since the \$18,000 refund offset the same amount of outlays.

Column 3. Shows the final end-of-year S.F. 133 that is submitted to OMB for the period ending September 30, 1996. In FY 1996, \$140,000 in expired unobligated balances (line 2.A) were carried forward from FY 1995 (column 2, line 10.E). During FY 1996, it was discovered that no obligations were recorded for a grant of \$65,000, which was made on April 15, 1994. The unrecorded obligation is treated as an upward adjustment. It is counted as an incurred obligation (line 8, 12) and subtracted from the initial unobligated balance (line 2.A) to get the year-end unobligated balance (line 10.E).

The unobligated balance fell \$65,000 (line 8) from \$140,000 (line 2.A) to \$75,000 (line 10.E). The initial obligated balance of \$50,000 (line 13.A) decreased to \$40,000 (line 13.C), since \$10,000 of existing obligations were paid. Net outlays were \$75,000 (line 14), which represents \$65,000 for the unrecorded grant and \$10,000 for existing obligations.

Column 4. Final end-of-year S.F. 133, submitted to OMB for the period ending September 30, 1997. In FY 1997, \$75,000 in expired unobligated balances (line 2.A) were carried forward from FY 1996 (column 3, line 10.E). During FY 1997, the bill for a cost-plus-fixed-fee contract originally obligated at \$15,000 was actually \$60,000. The \$45,000 upward adjustment is added as an incurred obligation (lines 8, 12) and subtracted from the

initial unobligated balance (line 2.A) to get the year-end unobligated balance (line 10.E). The unobligated balance decreased \$45,000 from \$75,000 (line 2.A) to \$30,000 (line 10.E).

The initial obligated balance of \$40,000 (line 13.A) decreased \$15,000 for payment of the contract obligation and \$5,000 for payment of other existing obligations. The final obligated balance was \$20,000 (line 13.C). Net outlays were \$65,000 (line 14), which represents \$15,000 for the contract obligation, \$5,000 for other obligations, and \$45,000 for the upward adjustment of the contract obligation.

Column 5. Final end-of-year S.F. 133, submitted to OMB for the period ending September 30, 1998. In FY 1998, \$30,000 in expired unobligated balances (line 2.A) are carried forward from FY 1997 (column 4, line 10.E). During FY 1998, actual bills received totaled \$27,000 more than the previously reported obligations. The \$27,000 upward adjustment is added as an incurred obligation (lines 8, 12) and subtracted from the initial unobligated balance (line 2.A) to get the year-end unobligated balance (line 10.E). The unobligated balance fell \$27,000 (line 8) from \$30,000 (line 2.A) to \$3,000. Only \$3,000 is now available for further upward adjustments.

The initial obligated balance of \$20,000 (line 13.A) decreased to \$15,000 (line 13.C) from the payment of \$5,000 in existing obligations. Net outlays were \$32,000 (line 14), which represents a \$27,000 upward adjustment and \$5,000 in existing obligations.

Column 6. Final end-of-year S.F. 133, submitted to OMB for the period ending September 30, 1999. In FY 1999, \$3,000 in expired unobligated balances (line 2.A) are carried forward from FY 1998 (column 4, line 10.E). During FY 1999, actual bills received totalled \$2,000 more than the previously reported obligations. The \$2,000 upward adjustment is added as an obligation incurred (lines 8, 12) and subtracted from the initial unobligated balance (line 2.A) to get to the year end unobligated balance of \$1,000 before the amount was cancelled. Net outlays were \$16,900 (line 14), which is comprised of \$2,000 for the upward adjustment and \$14,900 for existing obligations, which left \$100 in obligated balances before the amount was cancelled.

To cancel the balances at the end of the fiscal year, the unobligated balances of \$1,000 is cancelled, as a negative, on line 6 and a zero is recorded on line 10.E. The obligated balance of \$100 for which no disbursements were made is cancelled also. First, a positive amount is recorded on line 4.A, recovery of prior year obligations. This amount is cancelled, as a negative, on line 6. The \$100 in obligated balances is subtracted from the \$2,000 upward adjustment, and the net amount of \$1,900 is included on line 12. The total unexpended balances cancelled is shown as -\$1,100, on line 6.

The account is now closed.

FIGURE 5.4 Life cycle of appropriation. (From OMB Circular A-34, *Instructions on Budget Execution*, OMB, Washington, DC, 1994, Exhibit 111.)

Illustration of a 1994 Annual Appropriation During the Unexpired Year and Each Expired Year
REPORT ON BUDGET EXECUTION

FIGURE 5.4 (Continued)

TABLE 5.3
Standard Federal Budget Documents Available from the US Government Printing Office

Budget of the US government, fiscal year

- Contains the budget message of the president
- Presents the president's budget proposals

Analytical perspectives, budget of the US government, fiscal year

- Highlights selected program areas
- Shows other significant analyses, including economic and accounting, spending, revenues, borrowing, current service estimates, and more

Historical tables, budget of the US government, fiscal year

Budget of the US government, fiscal year—appendix

- Shows most detailed information on appropriations and funds
- Includes proposed appropriation language, legislative proposals, and certain off-budget activities
- Electronic sources of budget information are available via Internet (OMB, GPO)

or guarantee the repayment of indebtedness incurred by another person or government. The basic forms of budget authority are appropriations, authority to borrow, and contract authority. Budget authority may be classified by the period of availability (1-year, multiple-year, no-year), by the timing of congressional action (current or permanent), or by the manner of determining the amount available (definite or indefinite) (General Accounting Office 1981, 41).

2. Other Federal Sources

These and other federal sources of nonpartisan information and data—the Treasury Department, especially for revenue statistics; the Congressional Research Service of the Library of Congress; the Bureau of the Census of the Department of Commerce; the Council of Economic Advisors with its annual report; the Congressional Budget Office (pursuant to the 1974 act, discussed below); and other federal agencies such as Labor and Housing and Urban Development—have contributed mightily to the status and workload of the Government Printing Office. So too had Washington's nonpartisan Advisory Commission on Intergovernmental Relations (ACIR), founded in 1959 and publisher of many studies and series including over two decades of the data series *Significant Features of Fiscal Federalism* and, initiated in 1975, the journal *Intergovernmental Perspective*. Since 1972, annual surveys of public attitudes had been conducted for the Commission, first by Opinion Research Corporation and then by the Gallup Organization, and published in *Changing Public Attitudes on Governments and Taxes*. The ACIR had analyzed a large body of information pertaining to federal, state, and local fiscal relations.

Slating ACIR for termination in spring 1996, the 104th Congress began a reversal of the trend toward more information, analysis, and staff support. It took steps to abolish the congressional Office of Technology Assessment and deeply cut the Congressional Budget Office (CBO), Congressional Research Service (CRS), and GAO. Although cuts in congressional offices amount to relatively few dollars—Congress accounts for less than one-tenth of 1% of federal spending—some observers note a potential weakening of Congress and its ability to make informed budgetary decisions (Carney 1995, 2354–2355). For example, because CBO's expanded analytic role under the 1996 Unfunded Mandates Reform Act is funded at only a fraction of the original estimate, the CBO was especially hard pressed just when congressional leaders were relying on its numbers on deficit reduction, health care, and other budgetary and policy debates. Budget cutters also targeted some executive statistical agencies, including Commerce's Census Bureau and Labor's Bureau of Labor Statistics (Stanfield 1995, 2408). Among the many agencies whose mission is gathering

demographic, economic, business, and other data important to budgeting are OMB (<http://www.whitehouse.gov/omb>), Treasury (<http://www.ustreas.gov>), GAO (<http://www.gao.gov>), CBO (<http://www.cbo.gov>), and the Bureaus of Labor Statistics (<http://www.bls.gov>) and Census (<http://www.census.gov>).

3. New Kinds of Information

Technical analysis and information have become a major industry throughout the nation, and it is unlikely that efforts to reverse the trend will succeed. Even so, it is ironic that the threat to data availability and integrity runs counter to contemporary management approaches' emphases on hard data in decision making and the use of quantified, analytic tools in budgeting. The moves toward performance and outcome measures and cost-benefit analysis are cases in point that purportedly address governmental accountability and disclosure (or transparency).

The same purposes drove the Governmental Accounting Standards Board's (GASB) efforts to introduce Service Efforts and Accomplishments Reporting (SEA) at the subnational level. According to GASB's concept statement (1992, iii), "The measurement of a governmental entity's performance requires information not only on the acquisition and use of resources but also on the outputs and outcomes of the services provided and the relationship between the use of resources and outputs and outcomes." The GASB (1992, 111) notes that "The objective of SEA reporting is to provide more complete information about a governmental entity's performance than can be provided by the operating statement, balance sheet, and budgetary comparison statements and schedules."

In GAO's 1992 survey of the use of performance data, 102 federal agencies reported using performance measures. Even with overstated frequencies due to the research methodology (General Accounting Office 1993a, 30), only about 50% indicated that the measures are used to gauge progress in achieving strategic goals; 70% of responding managers reported that performance measures aid budgetary decision making, program management, and more. To more accurately assess practices, Congressional Budget Office (1993b) conducted detailed case studies of six agencies and confirmed "the importance of having a clearly defined mission, the difficulty of developing outcome measures for many government functions, and the often tenuous ties between budgeting and measures of performance.... Basic aspects of agencies' budgets are not determined by the relationship between inputs and outputs" (Congressional Budget Office 1993b, 35-36).

The 1993 Government Performance and Results Act (GPRA, P.L. 103-62) requires agencies to develop strategic plans prior to FY 1998, prepare annual plans setting performance goals beginning in FY 1999, and, starting in March 2000, report annually on actual performance compared with these goals. Using an eight-year implementation schedule, the GPRA requires federal agencies to set annual performance targets and OMB to submit a government-wide performance plan budget beginning for FY 1999 (see Table 5.1). Emphasizing GPRA's implementation, Office of Management and Budget (1994, 24) contains the definitions of key terms such as outcome and output measures and performance goal and indicator. The A-II summary (1994) states that "The 1996 budget process will take an important step in the direction of presenting more program performance measures—outputs and outcomes—in the budget and of linking goals to the resources required to produce them. This year's revision of circular no. A-11 reflects this new direction."

Cost-benefit analysis has been used for many decades by the US Army Corps of Engineers, but its role beyond capital projects dates to the Reagan administration. Issued in 1981, Executive Order 12291 required that new, major regulations with annual economic impact of \$100 million or more be subjected to cost-benefit analysis. It appears that its role will expand still further. Proposals for regulatory reform in *Contract with America* (Gillespie and Schellhas 1994) include the use of risk assessment and cost-benefit analysis. Methodological issues in budgeting and policy making were

enlivened but left unsettled by 1995 bills that would require use of risk assessment and cost-benefit analysis in federal agencies.

4. State Information Producers

State counterparts of federal information producers generate studies and publications, as do privately sponsored and university-associated bureaus of government research in many states, including but not limited to Idaho, California, New York, New Jersey, Georgia, and Connecticut. These organizations constitute an excellent source of readily available, timely, frequently state-specific data and analyses. Other producers include central staff offices such as budget and personnel, audit offices, labor and health departments, and even state-level analogs of ACIR.

5. Nongovernmental Information Producers

a. Public Interest Organizations

An impressive array of nongovernmental organizations generate publications that are frequently cited in government documents as well as academic works (see references). These organizations fall primarily into four categories: public interest organizations, research organizations, professional associations and organizations, and the purely or mainly academic organizations and publications. The first category includes the National Municipal League, the National League of Cities, the League of Women Voters, and a variety of others, some of which focus on state and local concerns. The Tax Foundation started publishing its monthly newsletter, *Tax Features*, in 1957, twenty years after its founding as a nonprofit organization, and its biennial volume, *Facts and Figures on Government Finance*, is a useful data collection (Sagoo, 2005). Among state-oriented organizations in this same category are the Council of State Governments (CSG, annual; Howard 1973) and the National Conference of State Legislatures, which publishes studies and surveys relating to budgeting and financial matters (Mackey 1993; NSCL 1981, 1983, 1986, 1994, 2006) and *State Legislatures Magazine* available online (1999-current).

b. Research Organizations

Several research organizations or think tanks are known for their highly reputed analyses and studies, many of which are funded as contract research under grants. The Brookings Institution was organized in its present form in 1927 as, by its own description, “an independent organization devoted to nonpartisan research, education, and publication in economics, government, foreign policy, and the social sciences generally.” The American Enterprise Institute, the Cato Institute, the Heritage Foundation, the Institute of Public Administration (responsible for publishing Gulick and Urwick 1937), the Rand Corporation, and the Urban Institute also fall in the category of research organizations, and are represented by citations in the references.

c. Professional Associations and Organizations

The number of professional associations, the third category of nongovernmental members of the information industry, necessitates an abbreviated introduction here. The Government Finance Officers Association, (GFOA, <http://www.gfoa.org>), founded in 1903 as the Municipal Finance Officers Association, started publishing its *Journal of Municipal Finance* in the 1920s; today it publishes the *Government Finance Review*. As its many widely used sources illustrate (GFOA 1994; Glick 1986; MFOA 1979; Miller 1984; Moak and Hillhouse 1975; Moak and Killian 1963; Strachota 1994), the GFOA’s publications program is geared toward practitioners. Similarly, the National Association of State Budget Officers (NASBO, <http://www.nasbo.org>) has published the *State Expenditure Report* annually since 1987 and, with the National Governors Association (NGA),

publishes The Fiscal Survey of States twice annually since 1979, along with other resources. The American Society for Public Administration (<http://www.aspanet.org>), the national organization for both practitioners and academics in public administration, first published the journal *Public Administration Review* in 1940; its role is apparent from the number of citations (Goodsell 1984; Gore 1994; Lewis 1994; Lindblom 1959, 1979; Mani 1995; Pyhrr 1977; Rubin 1990; Schick 1966, 1973; Wildavsky 1961), and it led to editions of “PAR Classics” on budgeting in 1980 and 1987 (Schick 1987). The Association for Budgeting and Financial Management of the American Society for Public Administration publishes *Public Budgeting & Finance* (e.g., Bland and Nunn 1992; Botner 1989), which first appeared in 1981. The International City/and most recently County Management Association (ICMA), whose focus is expressed in its title, is responsible for numerous publications, including the *Municipal Year Book* (annual) the periodical *Public Management*, and other resources (<http://www.icma.org>).

d. Academic Organizations and Publications

The scope and number of academic publications are simply too great to conform to the format of an introductory overview; the reference list is a better guide to this category (along with indexes to journals). Other bibliographies, some general and others tailored to specific aspects of the field of budgeting and financial management, are available in many other sources (e.g., Aronson and Schwartz (1987); Rabin and Lynch (1983)). The American Political Science Association’s journal, *American Political Science Review*, has been central to the development of the field, and a bibliography on budgeting dating to 1915 cites an early contribution (Rider 1915).*

The historical reach of other journals also amounts to an impressive testimony on behalf of continuity; for example, the *National Tax Journal* can be traced to 1907 as the *National Tax Association Bulletin*. Other journals speak to the continued vibrancy of the field. Examples include *The Public Manager* (formerly, *The Bureaucrat*), which has an orientation toward the concerns of federal practitioners, and *Public Budgeting & Finance*, which is directed towards academic and practitioner interests. (This essay includes a list of selected contemporary journals that are or have been especially influential in the field of American public budgeting and financial management. See Table 5.2.)

6. Growth Industry

The ensuing years saw the addition of information reflecting new responsibilities, concerns, and demands made on budget processes and budget documents. Performance and program measures, the packages for zero-base budgeting, forecasting models, and multiyear costing are but a few examples. Their avowed, pragmatic purpose is to provide better, more useful information for decision making and for scholarly and applied analyses. It is for history to judge whether this purpose has been served, but it can be said with confidence that information is still a growth industry and that budget documents themselves get longer and more complex.

*The American Political Science Association is the professional association for political scientists, and both practitioners and academics may and do join. Yet because the journal is geared to theoretical concerns and research rather than to the applied aspects of political science, the academic category seems most appropriate.

IV. PERFECTING THE PROTOTYPE

A. PURSUING THE CLASSICAL AND RADICAL

1. Time Horizon

One of the advantages of participating in so-called modern times is that tinkering and adjustments can be called modernization and reform. An obvious disadvantage is that the short time horizon inevitably distorts evaluation. It appears that the more recent the event, the more important it is judged as a matter of course rather than as a matter of judicious assessment. Moreover, individual and institutional memories are fresh enough to recall each effort, each error, and each minor swerve on a road that appears straightforward only from the secure distance of history. Nonetheless, it is already conventional to affirm that the prolonged, deep depression and the governmental responses that preceded World War II sufficiently altered the budgetary landscape we are viewing to evoke the cliché the Second American Revolution.

2. Second American Revolution

Governmental roles and responsibilities were redefined in terms of new demands and new theory:

Backed by the dire economic experiences of the Great Depression, John Maynard Keynes challenged the classical economists' position with *The General Theory of Employment, Interest and Money* (1936). The challenge was successful and the resulting Keynesian theory dramatically altered legislators' behavior toward budgeting and economic policy. Under the influence of Keynesian theory, fiscal policy has come to mean deliberate government utilization of public spending and financing in the development and stabilization of the economy.

A massive, unprecedented, domestic spending program took place at the federal level. With respect to the budgetary details of that spending program, it is useful to note that appropriations for some New Deal programs occurred outside the regular budget process. State and local governments became more dependent on Washington while simultaneously enlarging their responsibilities in a pattern that would be repeated in its broad outlines in the late 1960s and 1970s.

3. Accounting and Audit Standards

Financial crises, defaults, and concerns over financial management led to the imposition of limitations on taxes, expenditures, and indebtedness in many states and localities, a that would movement also be repeated at the end of the 1970s (ACIR 1977; Peterson et al. 1977). Furthermore, professional accounting and auditing standards began to develop rapidly and be applied to governmental operations. Starting in 1934, the National Council on Governmental Accounting (1968, 1980) saw many of its works published under the auspices of the Municipal Finance Officers Association (later the Government Finance Officers Association). Similarly, rapid development occurred in the 1970s subsequent to the publication of authoritative standards, coupled with financial difficulties in New York City and elsewhere. While periodization may vary according to emphasis and author, according to one source:

The first historically significant movement to reform municipal accounting began in the 1890s and came to an end with the founding of the first national municipal accounting board in 1934. The initial push for reform was provided by the National Municipal League and its backers in business, academia and government.... In January 1934, a National Committee on Municipal Accounting was formed and in 1935 the Committee approved accounting principles.... The stimulus for the two waves of reform [1890s– 1934, 1977 current] came from similar economic and political trends.... Both came after a crisis of confidence in the municipal bond market (Rousmaniere and Guild 1981, 66–67).

4. Brownlow Committee

In 1936, at the same time that Keynes was revolutionizing classical economics, President Roosevelt appointed a three-member committee to comprehensively examine the president's management functions. What emerged the next year from the Brownlow Committee was the "Report of the President's Committee on Administrative Management." It was built on the premise that the "efficiency of government rests upon two factors: the consent of the governed and good management" (Mosher 1976, 113). The latter required that the president be given the staff necessary for the managerial task, along with the power to reorganize the executive branch of government. In 1939, a modified version of the Brownlow Committee's recommendations was enacted in the Reorganization Act, authorizing the president to reorganize on a temporary basis, subject to legislative veto. With respect to fiscal management, the report recommended that the BOB be used as central staff and an informational center of the executive branch. The BOB was transferred from the Treasury to the Executive Office of the President, created under the 1939 Reorganization Plan (53 Stat. Reorganization Plan No. 1) and fine-tuned under Executive Order 8248 that same year.

The Brownlow Committee's recommendations suggest the extent to which seemingly innovative concepts and extraordinary events may coexist with or even be grounded in accepted wisdom and orthodox thinking. One outstanding and often-cited example of that orthodoxy, perhaps even its epitome, was published in 1937 under the title *Papers on the Science of Administration* (Gulick and Urwick 1937). Suffice it to note that budgeting figures was among the seven activities of a chief executive that were formulated into POSDCORB.* According to Gulick, "Efficiency is... axiom number one in the value scale of administration" (Gulick, in Gulick and Urwick 1937). This era of supposedly radical change is marked, then, by an underlying, prevailing faith: the belief that much can be accomplished through correct structure and correct principles, both of which can be identified and implemented, and both of which are justified on the grounds of a predominant value, efficiency.

5. The "Key" Question

The apparent conceptual and normative consensus obscured a matter that emerged only a year after the Reorganization Act in an article by the eminent political scientist V. O. Key, Jr. (Key 1940). If one were asked to select the single most important journal article published in budgeting and financial management, one would be well advised to avoid the task—perhaps at any cost! The choice, any choice, would simply generate protestations, raise forefingers in warning, and set heads to shaking in reproof by proponents devoted to another selection and for reasons as compelling as one's own. However, Key's "Lack of a Budgetary Theory" no doubt would make a short list, were one devised (Mosher 1976, 190–195; Shafritz and Hyde 1978; Shafritz and Hyde 1987). By eloquently and pointedly bemoaning a tendency in the literature to evade questions of allocations, he set the terms for discussion for decades to come:

On the most significant aspect of public budgeting, *i.e.*, the allocation of expenditures among different purposes so as to achieve the greatest return, American budgetary literature is singularly arid. Toilers in the budgetary field have busied themselves primarily with the organization and procedure for budget preparation, the forms for the submission of requests for funds, the form of the budget document itself, and like questions [here he cites Buck 1929, among others]... the absorption of energies in the establishment of the mechanical foundations for budgeting has diverted attention from the basic budgeting problem (on the expenditure side), namely: On what basis shall it be decided to allocate X dollars to activity A instead of activity B?

*The seven "principles" of POSDCORB include planning, organizing, staffing, directing, coordinating, reporting, and budgeting (Gulick and Urwick 1937).

The most advantageous utilization of public funds resolves itself into a matter of value preferences between ends lacking a common denominator. As such, the question is a problem in political philosophy.... In detail, what forces go into the making of state budgets? What factors govern decisions of budgetary officials? Precisely what is the role of the legislature?.... For the working budget official, the implications of the discussion rest primarily in a point of view in the consideration of estimates in terms of alternatives-decisions which are always made, but not always consciously.... The thousands of little decisions made in budgetary agencies grow by accretion into formidable budgetary documents which from their sheer mass are apt often to overwhelm those with the power of final decision (Key 1940, 1137–1144).

Replies to Key's question encompass a variety of factors, including economic principles, taxes, and politics. Verne Lewis termed Key's question the "\$64 question on the expenditure side of public budgeting" (and that is in current dollars!), and responded to it in terms of relative value, marginal utility, and relative effectiveness (Lewis 1952, 42–54). In his study of the history of federal budgeting, which emphasized the nineteenth century's reliance on the customs tariff as the major revenue source, Arthur Smithies, chairman of the Economics Department at Harvard University some forty years ago, wrote as if in response to V. O. Key, Jr., "And the ultimate criterion for the worthiness of expenditures is whether they warrant the taxes the Government must levy or the debt it must incur to finance them (Smithies 1955, xiii–xiv).^{*} Key's article was quoted over two decades after its publication in another likely candidate for that same short list, Wildavsky's discussion of budget reform:

In 1940, in what is still the best discussion of the subject, V. O. Key lamented "The Lack of a Budgetary Theory." He called for a theory which would help answer the basic question of budgeting on the expenditure side.... A theory which contains criteria for determining what ought to be in the budget is nothing less than a theory stating what government ought to do... a normative theory of budgeting would be a comprehensive and specific political theory... utopian in the fullest sense of that word; its accomplishment and acceptance would mean the end of conflict over the government's role in society. Perhaps the 'study of budgeting' is just another expression for the 'study of politics'... (Wildavsky 1961, 183–190).

6. Immediate Postwar Years

a. *Fiscal Policy*

The impact of the depression, the war, and conceptual developments is evident in the Employment Act of 1946 (60 Stat. 33 [1946]), in which federal responsibility for economic and social goals was recognized and the Council of Economic Advisors created.[†] Comprising three members appointed by the president with the Senate's advice and consent, the council was to submit an economic report to each regular session of Congress. The purpose was "to develop and recommend to the President

^{*}There are many studies of decision making about taxes, tax administration, and tax policy. They are not marked by consensus. One author concludes that public opinion is irrelevant to decisions about taxing and that these are not associated with spending decisions (Hansen 1983). According to a contrary thesis, "Expenditures are increased only to the point where the vote gained by the additional dollar spent is more than cancelled out by the vote lost by the additional dollar taxed. The budget is established where the tradeoff between spending money and raising revenues is equal" (Friedman 1980, 169). It has been suggested that environmental, legal, revenue-raising, and other factors affect tax decisions (Bingham et al. 1978, 193–211).

[†]Other legislation affecting the budget function and/or agencies include the Federal Reports Act of 1942, which gave the BOB statistical and data-collecting responsibilities; the Government Corporation Control Act of 1945, which extended the BOB's budget authority to wholly owned government corporations; the Classification Act of 1949, charging the BOB's director with regulatory duties; and the General Appropriation Act of 1950, which restated statutory authority for the apportionment procedure.

national economic policies to foster and promote free competitive enterprise, to avoid economic fluctuations or to diminish the effects thereof, and to maintain employment, production, and purchasing power..." (Mosher 1976, 180). Congress also established the Joint Economic Committee (Joint Committee on the Economic Report), and fiscal policy formally came into its own.*

b. *First Hoover Commission*

With the "Report of the Commission on Organization of the Executive Branch of the Government" in 1949, the decade drew to a close with a relapse to orthodoxy in high places. The report of the first Hoover Commission (so called after the chairman, ex-President Herbert Hoover) has been described as an expression of "the hard core of fundamentalist dogma" (Seidman and Gilmour 1986, 4).

Akin to the Brownlow Report in management philosophy and in making recommendations that would be repeated for decades, the report called for performance budgeting as preferable to the customary line-item format. Adamant on the subject at hand—the "budget and appropriation process is the heart of the management and control of the executive branch"—it announced that the "all-important thing in budgeting is the work or the service to be accomplished, and what that work or service will cost." The report recommended

that the whole budgetary concept of the Federal Government should be refashioned by the adoption of a budget based upon functions, activities, and projects; this we designate as a "performance budget."... Such an approach would focus attention upon the general character and relative importance of the work to be done, or upon the service to be rendered, rather than upon the things to be acquired, such as personal service, supplies, equipment, and so on.... Under performance budgeting, attention is centered on the function or activity—on the accomplishment of the purpose....

Some of the first Hoover Commission's recommendations were enacted in the Budget and Accounting Procedures Act of 1950 (Stillman 1982, 180–183). According to a 1958 BOB manual,

this act explicitly recognized the President's authority to determine the content, order, and arrangement of the proposed appropriations and statements of expenditures in the budget; pointed the presentation of financial needs in the budget toward the activities to be performed;... lent special support to the improvement of governmental accounting and auditing procedures;... and strengthened the Budget Bureau's work in the field of administrative analysis and integration of Federal statistical plans and operations. This law as well as the Budget and Accounting Act [1921] were amended in 1956 to improve further governmental budgeting and accounting methods and procedures (OMB BOB 1958, 22).

B. INCREMENTALISTS AND RATIONALISTS

1. Incrementalism

Charles Lindblom published his profoundly influential "The Science of 'Muddling Through'" in a 1959 issue of *Public Administration Review*, and much of the literature in public administration for the next two decades was devoted to an examination of decision making by "successive, limited comparison" (Lindblom 1959, 1979), critiques and rebuttals, empirical research, and explorations of alternative models. "Taken together, Lindblom's criticism of the wave of rationalism that swept

* Pointing to the passage of the Humphrey–Hawkins Act in 1978 and to the debate and legislation on deficits and taxes in the 1980s, some observers argued that fiscal policy crowds out other concerns. This concern intensified during the next two decades.

across government in the 1960s and 1970s help us to understand not simply the limitations of our budgetary practice, but the assumptions and implications that undergird them” (Plant 1986, 76).

Ideas about limits on cognitive capacity and decision-making strategies emanated from calculations of organizational and political feasibility and competitive advantage. Politics emerged as the dominant explanatory factor, rather than ideal and perhaps idealized versions of management principles and prescriptions. These ideas were injected into the way budgeting was thought about under the rubric of incrementalism. The path-breaking work of Aaron Wildavsky in the 1960s is most closely associated with this description of budgetary decision making (Davis et al. 1966; Wildavsky 1964, 1968). His *The Politics of the Budgetary Process* has gone through many editions since 1964 to become one of the most widely read books in the field, and was subsequently recast to account for changes in federal budgeting (Wildavsky 1992). In it, Wildavsky describes numerous strategies and counterstrategies that go into formulating budget requests and congressional appropriations. Succinctly defined, “incrementalism” is

a theory of the budgetary process proposing that policy makers give only limited consideration to small parts of the budget and arrive at decisions by making marginal adjustments in last year’s budget... participants [in different roles] make decisions through a process of bargaining and negotiation.... The budget as a whole is not considered.... Instead, participants make marginal changes on an already existing base (LeLoup 1988, 13).

Incremental budgeting “focuses upon the current year budget request with emphasis on increases from the current year” (Lynch 1979, 316).

Another way of stating the thrust of incrementalism is through the idea that the single best predictor of an agency’s budget request is history, in the form of last year’s appropriation or current services. (Historical comparison is built right into many budget justifications and requests by virtue of the forms themselves, the columns of which array prior years’ appropriations and actuals against this year’s request and appropriation.) From this vantage point, budgets are built out of many interactive, recursive judgments, sequential decisions, and past political accommodations. The three central aspects on which to focus are the base (last year’s appropriation), an expectation of fair share (maintaining budget share), and increment (a small, marginal change). Ordinarily, sweeping alterations in the percentage of the total budget going to any particular agency (budget share) are not to be expected, but the iterative nature of the process does allow for substantial change over several budget rounds. Thus, change in the short term is routinely expected to occur at the margins, affecting a relatively small proportion of the total budget in any given fiscal year.

2. Debate over Theories

The debate raged, with allegations of inherent conservatism, normative bias, limited applicability (only part of federal spending goes through the appropriations process and a large proportion of spending—for example, entitlements and other uncontrollables—is dedicated by previous decisions and laws), and budget data so highly aggregated so as to obscure important changes at the subagency and program levels. The issue of explanatory validity versus descriptive potency was raised as well (Gist 1977; LeLoup 1975, 1978; Moreland 1975; Natchez and Bupp 1973; Shull 1979; Wanat 1974, 1978). Criticism notwithstanding, Wildavsky’s work defined the research task in much the same way that Key’s earlier article framed the research question.

3. Rationalist Reforms

At the same time, efforts to improve the goal-setting and managerial functions of budgeting in Washington and in states and localities around the country continued, and found their way into the history via acronyms: PPBS, MBO, ZBB. It appears that even if routine decision making is incremental, reform efforts will seek to expand the potential for the rational-comprehensive approach to

decision making (Lindblom 1959; LeLoup 1986, 16; Wildavsky and Hammond 1965). Closely related to the economist's concept of rationality, this decision-making model led to budget procedures supposing a step-by-step elaboration of explicit (program) goals, consideration of the universe of alternatives, selection based on feasibility, costs, and benefits, planned implementation, and systematic evaluation. "These theories or conceptual models are important because many people take them seriously and try to reform public budgeting using one of the theories as their guide" (Lynch 1979, 22). If participants in budgeting tend to behave as they believe they ought and others do, then the theory to which the individual and the general literature subscribe plays an important role in the interaction of belief and behavior, termed self-fulfilling prophecy.

a. *Johnson Administration and PPBS*

President Lyndon B. Johnson's administration introduced the planning-programming-budgeting system (PPBS) into federal budgeting, first in the Defense Department and then more broadly throughout federal departments and agencies.* Attempting to integrate planning and budgeting functions through modern systems analysis and cost-benefit analysis, PPBS is a comprehensive and systematic approach to the analysis of alternatives, costs, and consequences. It is marked by a voluminous and important literature that provides more or less stringent definitions, including BOB's bulletin no. 66-3 of October 1965.†

The grandiose, perhaps unattainable goals, included precisely identifying national goals, choosing among them, selecting the most effective and efficient means, and measuring performance.

To these specifications, he added something with which few would quarrel, that "It is important to remember one thing: no system, no matter how refined, can make decisions for you. But our judgment is not better than our information" (in Subcommittee on National Security 1967, 1–2).

b. *Nixon Administration, GRS, and MBO*

In 1970, President Nixon reorganized the Executive Office and created a Domestic Council that was expected to absorb the goal-oriented, planning function integrated by PPBS with the budget process in the renamed Office of Management and Budget (OMB). The next year, an OMB memorandum relieved federal agencies of the task of preparing program-related submissions and memoranda, and Allen Schick shortly recorded "A Death in the Bureaucracy" (Schick 1973). It bears noting that program budgeting enjoyed widespread adoption among state and local governments. A majority of states used a program format for appropriations to agencies (NASBO 1981, 14).

President Nixon also began the shift from the short-lived Great Society of his predecessor and centralization of the New Deal by inaugurating the new federalism in intergovernmental relations. This represents a reorientation of roles and responsibilities, coupled with a comprehensive reform of the confusing, often overlapping, numerous, and increasingly costly grant-in-aid programs. In a televised presidential speech in August 1969, the president enunciated his purpose and intent by proposing revenue sharing:

* The references include a few of the more frequently cited studies of PPBS (Hinrich and Taylor 1969; Lyden and Miller 1972; Merewitz and Sosnick 1971; Mosher 1969; Schick 1966, 1973; Rabin, in Golembiewski and Rabin 1975, 427–446); these and other sources (such as Grafton and Permaloff, in Rabin and Lynch 1983, 118–124) provide extensive bibliographies on this subject specifically.

† This administration was also responsible for introducing the "unified" federal budget and retaining the "cash" budget, based on the recommendations of the President's Commission on Budget Concepts (1967). The "unified budget" refers to the "present form of the budget of the Federal Government adopted beginning with the 1969 budget, in which receipts and outlays from Federal funds and trust funds are consolidated.... By law, budget authority and outlays of off-budget entities are excluded from the unified budget, but data relating to off-budget entities are displayed in the budget documents" (Committee on the Budget 1981, 133). See treatment of Social Security under GRH and BEA (herein) as examples.

We come now to a proposal which I consider profoundly important to the future of our Federal system of shared responsibilities....

For a third of a century, power and responsibility have flowed toward Washington, and Washington has taken for its own the best sources of revenue.... We intend to reverse this tide, and to turn back to the States a greater measure of responsibility—not as a way of avoiding problems, but as a better way of solving problems.

The entitlement program, general revenue sharing (GRS), was enacted in October 1972 by passage of Public Law 92-512, the State and Local Fiscal Assistance Act (Caputo and Cole 1976). The audit requirement in the 1976 reauthorization would introduce a new element of financial control and responsibility in many localities. Moreover (and unabashedly drawing on hindsight), the effort to shift the arena from Washington and to use more permissive financial arrangements (e.g., block grants) hinted at what was to come a decade later. General revenue sharing was completely terminated by fiscal year 1986.

The Nixon administration passed through a stage of management by objectives (MBO), attributed to Drucker's (1954) *The Practice of Management*. According to one assessment,

The purpose behind the federal MBO program was to develop consensus around presidential policy goals and then measure the degree of progress toward those goals.... The focus is on government actions and their consequences, not their costs.... When a new president came to office in 1977, MBO faded from view (Grafton and Permaloff, in Rabin and Lynch 1983, 101–102).

c. Carter Administration and ZBB

By virtue of bulletin no. 77-9, zero-base budgeting (ZBB) became the Carter administration's contribution to the rationalist reform litany repeated on the executive side for over a decade (Carter, 1977). The approach is credited to Pyhrr (1977), with whom Carter implemented ZBB while he was governor of Georgia (Lauth 1978; Pyhrr 1977).^{*} Carter announced his own comprehensive goals in a press release on February 14, 1977. Working from a hypothetical zero base, analysts were, among other things, supposed to devise options for alternative funding levels for "decision units," package and rank them, and reconcile these with the operating budgets to be appropriated (Office of Management and Budget 1977). This reform fared little better, and was officially laid to rest in Washington with OMB's circular A-11 in 1981. Even so, it made a significant contribution to the literature and understanding of contemporary budgeting (Grafton and Permaloff, in Rabin and Lynch 1983, 118–124; Hyde and Shafritz 1978, 252–323; Positer and McGowan 1984).

d. Reform Assessed

The "judgment of history" may very well conclude that fifteen years of unsuccessful spurts of reform, aimed at clarifying systematic and comprehensive choice, left an indelible mark on the myth rather than on the practice of budgeting. Unrealistic expectations, burdensome paperwork, increased potential for conflict, bureaucratic resistance and entrenched routines, faltering executive interest, and a variety of environmental factors are among the many reasons cited for failure. Given that the most likely potential outcome is shortfall if not outright failure, why do moves toward rationally oriented reform at the federal, state, and local levels of public budgeting recur continuously, if not always zealously or sustained? Perhaps part of the answer lies in the continuing

^{*} One source traces ZBB in the literature to 1924 and to the Department of Defense in the early 1960s (Merewitz and Sosnick 1971, 62). See also Wildavsky and Hammond (1965).

commitment of the budgeters' profession to rationalism and improvement. But the federal experience just recounted suggests that part of that answer lies also with a new executive's interest in announcing that the new boss has arrived in town—there may be no more efficient way of commanding the bureaucracy's immediate attention than by changing budget forms.

C. CONTROL!—ACCOUNTABILITY AND ECONOMY

1. Historical Perspective

American budgeters have been fascinated by control since Isabella and Ferdinand dispatched “the royal controller of accounts, sent along to keep tabs on Columbus's swindle sheet when he started to figure the cost of the gold and the spices he would accumulate” (Cooke 1973, 33). In that tradition, according to the Commonwealth of Massachusetts' archives, the routines and procedures that constituted controls even in colonial times were not even waived for revolutionary exigency. Paul Revere's bill for “riding for the Committee of Safety” and printing “soldier notes” was duly submitted; the House of Representatives approved payment in August 1775—in full discharge of the written account—for seven shillings less than the sum of the illustrious patriot's expense account (see Figure 5.5 and Figure 5.6).

Reasonable assurance that public monies are being spent as intended is by no means a concern unique to the United States or to the modern era. The insistence on evidential verification and separation of duties, both standard techniques in contemporary control systems, has been traced back five and one-half millennia to Mesopotamian records showing various marks alongside financial records. “One scribe prepared summaries of transactions; another verified them. It was probably here that the control systems of verification and division of duties originated” (Sawyer 1981, 3). The word *audit* is derived from the Latin *auditus*, referring to the oral verification of one official's accounts by another (Sawyer 1981, 4).

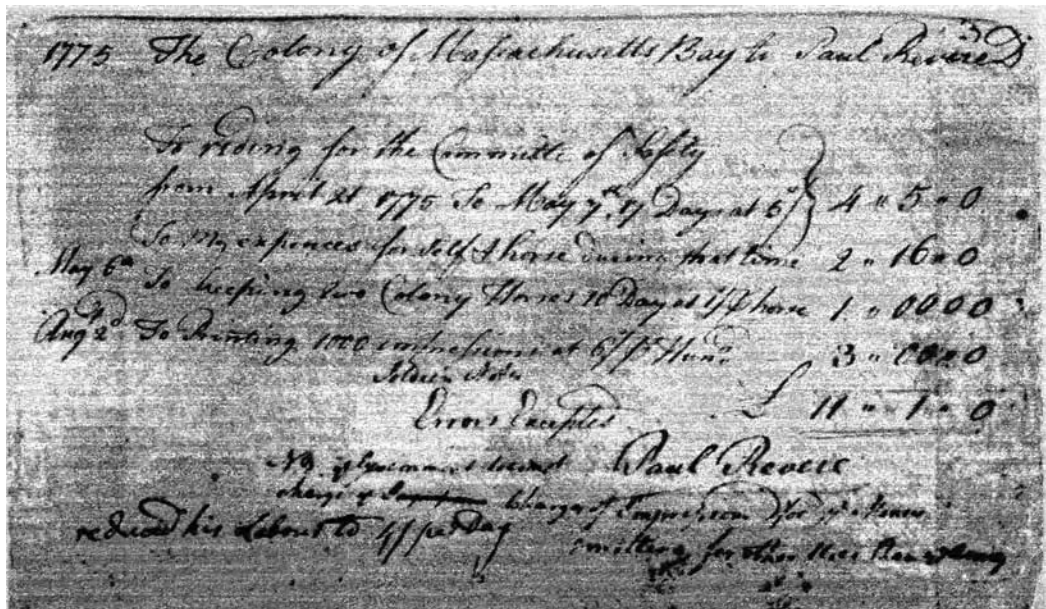

FIGURE 5.5 Paul Revere's expense account.

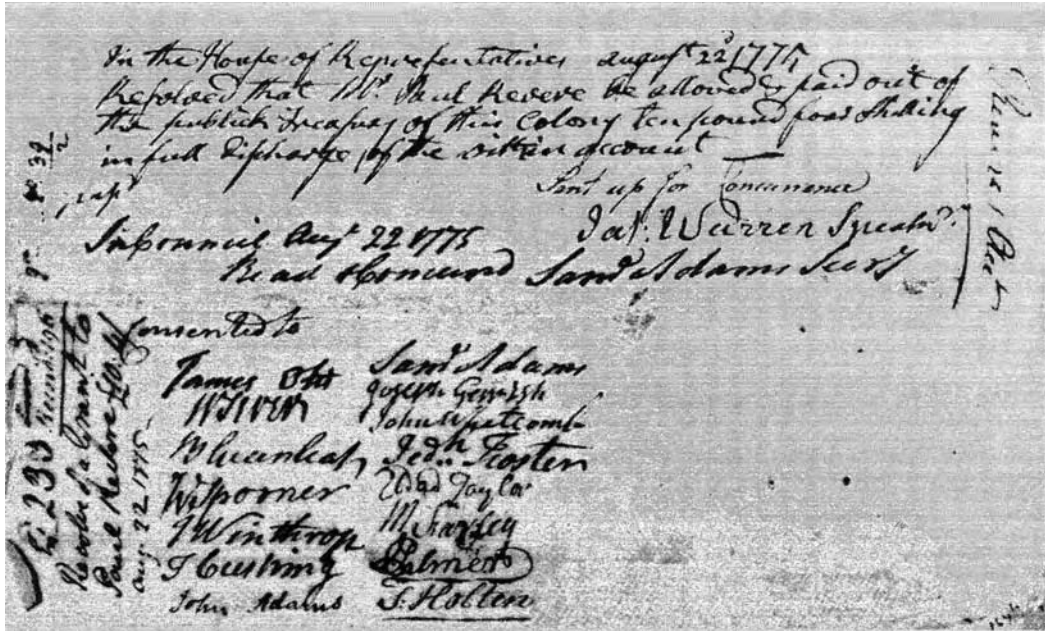

FIGURE 5.6 1775 Resolution of the Massachusetts House of Representatives.

2. Control-cum-Accountability

a. Procedures

In its accountability connotation, control conjures up all the safeguards protecting the fiduciary (or “prudent steward”) aspect of handling public money. In practice, it means procedures and records routinely required on financial transactions. Controls are categorized by the source of oversight authority (internal and external controls), and whether they occur before or after the financial transaction (preaudit and postaudit controls). A number of safeguards integrated into a systematic approach are designed to reduce the risk of fraud, waste, abuse, loss, and inefficiency. The detailed, line-item appropriation is the most important preaudit control exercised by the legislature, and as such has remained a characteristic feature of US public budgeting for two centuries. Apportionment, a twentieth-century development (see above), is the preeminent external, preaudit control emanating from the executive. Its counterpart after the transaction has taken place is the postaudit, representing either a legislative or an executive function or both; the postaudit is an independent verification of the financial condition and operating results according to professional standards. Other control devices include procurement invoices and vouchers, appropriations accounts, encumbrances, personnel schedules, and the like. Taken as an aggregate, these procedures, papers, rules, and records are time-consuming, expensive, and cumbersome. Individually, some are trivial, others inexplicable without reference to historical legacy; many are annoying to those compelled to abide by them. Sometimes the efforts made to circumvent them are of heroic caliber, but nevertheless illegal; other times, these efforts are simply pursued for fraudulent purposes or personal gain.

b. And Politics

Control is not a small matter on the periphery of budgeting and thus suitably left to subordinates or financial managers. It is rather a mainstay of the budget process and a guardian of the political

relationships and goals embedded in that process.* For example, the continuing saga of legislative–executive conflict has been played out in terms of mundane details such as appropriations accounts. This point is emphasized in A. E. Buck’s discussion of control-cum-accountability in the special studies accompanying the Brownlow Report submitted to President Roosevelt in 1937.† According to Buck, “The itemization of appropriations has gone so far that it often enables Congress to brush aside the Executive and to control the administration directly through detailed specifications in the granting of money” (President’s Committee on Administrative Management 1937, 144). Buck goes on to quote from Cleveland’s paper on “Detailed Versus Lump-Fund Appropriations” delivered to the 1913 meeting of the Association of Public Accounting Officers, in which Cleveland argues that “legislative control over the administration through detailed appropriations is a device adopted for use of a political institution....” Buck’s introductory statement, still relevant more than one-half century after it was written, sums up the issue nicely: “The working basis of the national fiscal system is found in certain political and administrative controls that emanate from the Congress and from the President.”

Mary Parker Follett focuses directly on the control issue in her 1932 lecture, published in the famous collection edited by Gulick and Urwick, *Papers on the Science of Administration* (1937, 161–169). In “The Process of Control,” she asks, “... what can we say are the principles of control? This is the same as asking what are the principles of organization. For the object of organization is control, or we might say that organization is control” (Follett, in Gulick and Urwick 1937, 161). In her usage, control is defined broadly as a process of coordination.

c. As Budget Function

Almost one-half century later, in an especially influential examination of the budgetary functions, Allen Schick argued that different emphases or “orientations” and their related concerns and processes vie with each other for predominance in different periods (Schick 1966). Accordingly, budget systems contain three contending functions—planning, management, and control—and are distinguished by the tilt in overall direction. Strongly supporting contemporary rationalist reforms (PPBS), the author concludes, “All the differences may be summed up in the statement that the ethos of budgeting will shift from justification to analysis.” According to Schick,

Control refers to the process of binding operating officials to the policies and plans set by their superiors... predominant during the execution and audit stages, although the form of budget estimates and appropriations often is determined by control considerations. The assorted controls and reporting procedures that are associated with budget execution... have the purpose of securing compliance with policies made by central authorities.

A control orientation deals with a relatively narrow range of concerns: How can agencies be held to the expenditure ceilings established by the legislature and chief executive? What reporting procedures...: What limits... on agency spending personnel and equipment? (Schick 1966, 244–245)

Because each orientation builds on the other in successive stages of reform (and of information, analysis, and decision-making requirements and capacity), one may infer from Schick’s analysis that the control orientation is a necessary part of all subsequent systems and a permanent fixture in budgeting. It is on this foundation that later additions rest. Thus it is readily understandable that

* Control is a topic that has occupied great minds or at least much time, as suggested in the exhibit from the Massachusetts House of Representatives, wherein consenting participants included James Otis, John Winthrop, Sam Adams, and others.

† Written by A. E. Buck, the study is entitled “Financial Control and Accountability” and is part of the report of the President’s Committee on Administrative Management (1937, 137–168). Committee members included Louis Brownlow, Charles E. Merriam, and Luther Gulick.

fiduciary responsibility, the accountability aspect of control, has been and continues to be a dominant theme in the history of US budgeting and financial management.

d. Professional Standards

Perhaps no one would agree more than the players: the professional accountants, auditors, and budgeters who have developed professional standards over the last half century. One source of these standards is the GAO, which issued statements of principles and concepts of internal auditing for federal agencies in 1957 and 1968, and published a comprehensive statement of standards for governmental audits in 1972 in *Standards for Audit of Governmental Organizations, Programs, Activities, and Functions*, called “the yellow book.” In 1974, the American Institute of Certified Public Accountants (AICPA) issued its industry audit guide, *Audits of State and Local Government Units*. Despite serious ongoing professional efforts to establish and abide by accepted procedures, it appears that practice has not yet been perfected. A GAO review of audits performed on recipients of federal assistance found that CPAs did not satisfactorily meet generally accepted government auditing standards in 34% of the governmental audits (GAO 1986c). As summarized by the GAO, generally accepted audit standards (GAAS) require professional proficiency, independence of attitude and appearance, due professional care, and removal or reporting of limitations on the scope or comprehensiveness of the audit (GAO 1986c, appendix 1).

Generally accepted accounting practices (GAAP) were developed under the auspices of the National Council on Government Accounting (NCGA), and published by the Government Finance Officers Association (GFOA, formerly MFOA). The NCGA’s thirteen basic principles were published in 1968 in *Governmental Accounting, Auditing, and Financial Reporting*, the “blue book,” or GAAFR. (According to the foreword of the 1980 edition, more than 40,000 copies of the 1968 edition were distributed!) It achieved authoritative status when the 1974 AICPA Audit Guide acknowledged GAAFR as the GAAP for state and local governments. The 1980 edition of GAAFR included the NCGA’s 1979 “Statement I,” the very foundation of contemporary standards for accounting and financial reporting, and details about its application. Statement I was recognized as GAAP by AICPA in 1980. Thus GAAP and authoritative standards emanated from NCGA and were subsequently confirmed by virtue of AICPA’s acceptance. In 1984, NCGA was supplanted by the Governmental Accounting Standards Board, which continues to propose statements and interpretations that are incorporated into professional accounting standards. The most recent GAAFR (GFOA 1994) includes the twenty-four GASB pronouncements issued as of June 1994.

It is useful to make note of the fact that GAAFR’s perspective on electoral politics and politicians smacks of the old dichotomy between administration and politics. It is especially important because it is impossible to overstate the impact of politics and politicians—as well as the accounting profession—on budgeting and financial management.

The governmental atmosphere is greatly influenced by the political process. Elected officials selected on the basis of popularity or political ties may not possess the management skills necessary for their positions. Elected government officials are generally interested in being elected. Unfortunately, the financial management activities most likely to enhance their re-election chances may not be optimally consistent with the efficient attainment of governmental social service organizational objectives.

... Both the formal and informal political structures of governments affect their accounting and financial reporting activities and needs. (MFOA 1980, 2)

e. Fiscal Crisis

Perhaps the single strongest impetus behind the renewed attention directed toward accountability elements has been the New York City fiscal crisis of the 1970s. When the financial markets closed

on the city in 1975, the lesson for the budgeting and financial management community was more than the “streets were [no longer] paved with gold” (Auletta 1980); alarm over financial management, accounting and auditing practices, financial reporting, and public disclosure, especially with respect to bond offerings, spilled beyond the city boundaries. New York City’s experience (and, subsequently, that of other jurisdictions including Yonkers and Cleveland) affected reporting and accounting nationwide.* While New York City was restructuring its debt under the auspices of the state-established Municipal Assistance Corporation and revamping its financial and budgetary practices, other changes were visible on a national scale: the reauthorization of general revenue sharing instituted audit requirements, bond prospectuses grew in length and detail, and newspapers and periodicals including the *New York Times*, the *Wall Street Journal*, *Intergovernmental Perspective*, and even the *Congressional Record* reported the unease and demand for more and better management, accounting, and disclosure procedures. If an incentive was needed to back up conformance, then New York City provided it. After being somewhat ignored, perhaps as a realistic response to the grants game, control issues and concerns were revived in state and local budgeting and in intergovernmental finance (Dirsmith and Simon 1983; NCGA 1980).

Concern over financial practices resurfaced in December 1994, when California’s wealthy (in terms of residents’ income) Orange County became the largest municipal bankruptcy in history. Responsible for an investment pool worth \$7.5 billion for 187 government participants, including 34 cities and 38 school districts, the county’s treasurer used reverse repurchase arrangements for leveraging and derivatives in a high-risk investment strategy. Upon incurring a \$1.7 billion loss, the county petitioned for bankruptcy relief. In June 1995, voters among the 2.6 million residents rejected the tax increase in a referendum held in compliance with the 1978 tax and expenditure limitation (TEL), proposition 13.

f. Recent Federal Moves

The US Congress enacted the Federal Managers’ Financial Integrity Act (31 U.S.C. 3512[b] and [c]) in 1982. Aimed at reinforcing accounting and internal control requirements dating from the 1950s, the act underscores the continuing concern with accountability for all funds. The act requires each agency to establish and maintain its internal controls in accordance with the Comptroller General’s standards, issued in June 1983 in *Standards for Internal Controls in the Federal Government*. The OMB issued guidelines for evaluating controls in executive departments and agencies in December 1982, building on the prescriptions and standards in OMB circular A-123, *Internal Control Systems*. These developments turned attention to annually assessing and reporting on the adequacy of internal controls and accounting systems.

Accurate disclosure of financial data is critical to performance assessment, and sound financial management systems are central to that performance. In response to grave inadequacies in both areas, serious efforts have been undertaken to improve and modernize financial reporting and management. Highlights include the Chief Financial Officers Act of 1990, which clarified responsibility for financial management, aimed at integrated financial systems, and created a coordinating council, and the establishment of the Federal Accounting Standards Advisory Board in 1990 to develop uniform accounting principles and standards. In 1991, the US Treasury’s Financial Management Service published its prototype Consolidated Financial Statements of the United States Government. In 1993 the OMB revised its 1984 circular A-127, *Financial Management Systems*, and required that each agency create a single, integrated system of financial management. According to GAO’s Joint Financial Management Improvement Program, the Chief Financial Officers Council adopted a vision statement in 1994 that avowed, “Enabling government to work better and cost less requires program and financial managers, working in partnership using modern

* In 1983, the Washington Public Power Supply System, derisively referred to as “Whoops,” defaulted on \$2.2 billion in revenue bonds.

management techniques and integrated financial management systems, to ensure the integrity of information, make decisions, and measure performance to achieve desirable outcomes and real cost effectiveness” (GAO 1995b, 1–2).

3. Control-cum-Economy

Prudence has another meaning, related to some sense of the appropriate amount or level of spending. This aspect of control, related to economy, is also important to an understanding of developments in US budgeting. Even before the acceptance of executive budgeting in Washington, Frederick A. Cleveland observed, “But it was the uncontrolled and uncontrollable increase in the cost of government that had finally jostled the public into an attitude of hostility to a system which was so fondly called the ‘American system’” (Cleveland 1915, 22). Ceilings, caps, and freezes have been familiar tools in budget shops, whether in Washington, state offices, or town halls (Ceilings 1975; Lewis and Logalbo 1980).

a. *Spending Patterns*

During the postwar period, the state and local public sector was a high-growth industry, with spending increasing at rates several times that of the economy. Then in the 1970s, a reversal began. In 1974 local spending in real terms began to decline; in 1976 state spending exhibited the same pattern. This “rediscovery of the revenue constraint” (Peterson, in Gorham and Glazer 1976, 35–118) is explained by a confluence of factors, including recession, double-digit inflation, managerial and political action and inaction, public opinion (especially about taxes), structural adjustments in the economy, and a turnabout in federal funds (reinforced by changes in federal policy and funding). It was soon learned that New York City was not an isolated case but the epicenter of shockwaves that rippled across the country. The outcomes included a slowdown in the growth of real spending at the state and local levels, improved financial management practices (or at least standards), more numerous restrictions on local budgets (see below), some hard choices, and the demise of some political careers.

b. *Retrenchment*

These experiences also generated a literature on retrenchment, or cutback management, represented by the influential article, “Organizational Decline and Cutback Management” (Levine 1978). If one accepts Levine’s conclusion that the “world of the future is uncertain, but scarcity and tradeoffs seem inevitable,” then the analytical contributions emerging from this period will continue to be practically important and analytically relevant. As Levine warns,

Government organizations are neither immortal nor unshrinkable. Like growth, organizational decline and death, by erosion or plan, is a form of organizational change; but all the problems of managing organizational change are compounded by a scarcity of slack resources. This feature of declining organizations—the diminution of the cushion of spare resources necessary for coping with uncertainty, risking innovation, and rewarding loyalty and cooperation—presents for government a problem that simultaneously challenges the underlying premises and feasibility of both contemporary management systems and the institutions of pluralist liberal democracy (Levine 1978, 316, citations omitted).

More recent studies of fiscal stress are cited in the references.

c. *Proposition 13 and TELs*

Contemporary insistence on economy as a decisive value in public budgeting at the state and local levels is best illustrated by Proposition 13, an initiative amendment to the California constitution

passed by referendum in June 1978 (see Figure 5.7). Its provisions called for limiting taxes on property to no more than 1% of its estimated 1975–1976 market value, and for capping each annual increase in assessment at 2% (unless sold, whereupon market value applies). Moreover, the Jarvis–Gann amendment, so called after its sponsors, subjected the imposition of local tax increases and new taxes to stringent electoral approval (two-thirds of qualified voters) and required the approval of two-thirds of both houses of the state legislature for additional state taxes.

The popular, professional, and academic presses announced that the tax revolt was on.* Conferences, press releases, and entire journal issues (e.g., *Intergovernmental Perspective* 1978) were devoted to the hotly debated issue. For purposes of historical accuracy, however, one should note that tax and expenditure limitations (TEs) hardly constituted a new phenomenon or a new response to perceived profligacy or abuse (Bennett and DiLorenzo 1983). Limitations on operating budgets date to the 1930s and on capital budgets to a century before that. The Advisory Commission on Intergovernmental Relations found that fourteen states and Washington, DC, enacted some new control on local powers to spend and tax during the years 1970 to 1977, prior to the passage of Proposition 13. Tax and/or expenditure constraints of various types currently operate in most states. Relating TEs to state-imposed spending mandates, ACIR attributed this “recent upsurge” to several factors, including “public demand for property tax relief” (Shannon and Gabler 1997).

Several statistics are relevant to an understanding of the current role of property taxes in budgeting and in politics more broadly. Reliance on property taxes hit a “historic low” in 1981, falling to less than 31% of state and local tax revenues, and forty-six states have provided some sort of property tax relief (e.g., “circuit breaker”) since the late 1960s (Walker 1986, 74). However, the property tax is still a vital component of the state and local tax structure and a volatile issue in local politics.† It is also necessary to consider public attitudes towards property taxes, especially in relation to other taxes. According to ACIR’s “Changing Public Attitudes,” the local property tax only lost its preeminent position as “the worst tax—that is, the least fair” in 1979, when the federal income tax won this dubious distinction, which it retained through 1985 (ACIR 1985, 1). In 1994, the local property tax and federal income tax tied as the worst tax (ACIR 1994).

d. *Grace Commission*

Federal offices have not been immune to the paroxysm of control-cum-economy. The President’s Private Sector Survey on Cost Control (PPSS) was initiated by Executive Order 12369 in 1982 to “identify and suggest remedies for waste and abuse.” The Grace Commission, named after the chairman, J. Peter Grace, reported its survey results on ways to cut costs and enhance revenues in January 1984, with almost 2500 recommendations purported to amount to \$424 billion in savings in three years... or \$1.9 trillion annually by the end of the century! According to the transmittal letter of January 12, 1984, recommendations with respect to system failures and personnel mismanagement account for almost three-fifths of the potential savings, a finding that elicits the conclusion that “they are at the foundation of inefficiencies in the Federal Government” (Grace Commission 1984, 6). Making a point also emphasized in the popularized version of the report (Fitzgerald and Lipson 1984), the letter dismisses traditional political considerations as legitimate criteria for decision making about public spending. It states,

We found Congressional interference to be a major problem. For example, because Congress obstructs the closing of bases that the military wants to close, the three-year waste is \$367 million. In total, PPSS

* In another well-publicized manifestation, the tax revolt struck Massachusetts in the form of Proposition 2, which limited property tax and property tax increases.

† The Tax Foundation’s *Tax Features* is an influential source of current data and opinion on taxes.

The initiative proposes adding Article XIII A to the Constitution to read:

Section 1.

(a) The maximum amount of any ad valorem tax on real property shall not exceed one percent (1%) of the full cash value of such property. The one percent (1%) tax to be collected by the counties and apportioned according to law to the districts within the counties.

(b) The limitation provided for in subdivision (a) shall not apply to ad valorem taxes or special assessments to pay the interest and redemption charges on any indebtedness approved by the voters prior to the time this section becomes effective.

Section 2.

(a) The full cash value means the County Assessors valuation of real property as shown on the 1975-76 tax bill under "full cash value", or thereafter, the appraised value of real property when purchased, newly constructed, or a change in ownership has occurred after the 1975 assessment. All real property not already assessed up to the 1975-76 tax levels may be reassessed to reflect that valuation.

(b) The fair market value base may reflect from year to year the inflationary rate not to exceed two percent (2%) for any given year or reduction as shown in the consumer price index or comparable data for the area under taxing jurisdiction.

Section 3.

From and after the effective date of this article, any changes in State taxes enacted for the purpose of increasing revenues collected pursuant thereto whether by increased rates or changes in methods of computation must be imposed by an Act passed by not less than two-thirds of all members elected to each of the two houses of the Legislature, except that no new ad valorem taxes on real property, or sales or transaction taxes on the sales of real property may be imposed.

Section 4.

Cities, Counties and special districts, by a two-thirds vote of the qualified electors of such district, may impose special taxes on such district, except ad valorem taxes on real property or a transaction tax or sales tax on the sale of real property within such City, County or special district.

Section 5.

This article shall take effect for the tax year beginning on July 1 following the passage of this Amendment, except Section 3, which shall become effective upon the passage of this article.

Section 6.

If any section, part, clause, or phrase hereof is for any reason held to be invalid or unconstitutional, the remaining sections shall not be affected but will remain in full force and effect.

FIGURE 5.7 Proposition 13: property tax limitation.

recommends three-year savings of \$3.1 billion by closing excess military bases, equivalent to the three-year income taxes of 466,000 median income families (Grace Commission 1984, 5).

The rhetoric and the recommendations elicited commentary and criticisms. The CBO and GAO, admittedly targets of some of the proposals, reviewed nearly 400 recommendations,

accounting for almost 90% of the potential savings over the three-year period. This review “found that the potential deficit reductions that might result for 1985 to 1987 from implementing most of these recommendations would be much smaller than... projected” (CBO–GAO 1984, 1). Perhaps even more serious is the following observation:

Although the majority of the Grace Commission recommendations can be characterized as management proposals to achieve greater efficiencies or to operate on a more business-like basis, the bulk of the cost savings estimated by the PPSSCC are associated with proposals to change policies or to restructure programs. All of these proposals would require Congressional action (CBO–GAO 1984, 2).

Nonetheless, about two-thirds of the revised recommendations were found to have some merit, according to GAO, which had made “similar or related recommendations” in well over one-half the cases. Another analysis broadly concurs and concludes,

In two major respects the Grace Commission misrepresented what it did and what it accomplished. First, the savings it claims would be achieved by adoption of its recommendations are grossly exaggerated. Second, its mandate and posture of improving efficiency and not proposing new policy were widely ignored (Goodsell 1984, 199).

Reminiscent of earlier presidential commissions, this more recent one also emphasized efficient management. In what may evolve into its most significant legacy, the commission recommended a more centralized approach toward an acknowledged role for management concerns. Specifically, it suggested that an Office of Federal Management be created in the Executive Office of the President to encompass OMB, GSA, and OPM to oversee management systems throughout the government.

Efficiency, a business posture, cost cutting, and outright economy represent enduring values in US public budgeting and financial management. While one may not wish to fault this commission any more than its predecessors for pursuing these or other selected values, neither custom nor consensus alters their ideological origin. The value-laden, interpretive approach to budgeting reflects what is probably inherent in the general field of public administration:

A final business-oriented bias of the Grace Commission is the insistence on an integrated, centralized, tightly controlled approach to public administration. The government is viewed not as a series of many organizations but as a single organization.... One must generally conclude that while the PPSSCC worked hard and produced a number of good ideas, its blizzard of paper, uneven quality of analysis, dubious savings estimates, business bias, centralization mania, anti-public service posture, and penchant for stealth make the liabilities of such an operation far outweigh its worth (Goodsell 1984, 201, 203).

e. *National Performance Review*

The concepts and practices associated with total quality management (TQM) formally began their penetration into federal agencies when the Internal Revenue Service embraced TQM in 1986 (Mani 1995). Adapting TQM principles to government and coupling them with state and local governments’ experiences with innovative techniques and processes, Osborne and Gaebler took center stage with the publication of their *Reinventing Government* in 1992. Defining “the problem” as neither too much nor too little government but rather “the wrong kind of government” (Osborne and Gaebler 1992, 23, italics omitted), the authors argue on behalf of decentralized, innovative, adaptive, competitive, effective, creative, market-oriented, and customer-focused public institutions. Among the specific techniques advocated are quantifiable data such as performance measures and budgeting with an eye on the mission and a focus on outcomes.

With President Clinton's administration committed to reinventing principles, the vice president undertook leadership of the National Performance Review (NPR), a government-wide examination of operations with the aim of developing recommendations to, for example, cut "unnecessary" spending and implement outcome budgeting (Gore 1993, xl–xli). The first step: "streamlining the budget process" (Gore 1993, 7). Describing a process lacking strategic thinking, critical debate, and useful information, Vice President Al Gore's NPR report (1993) recommended an executive budget resolution to set broad policy and allocate funds by function, biennial budgeting and appropriations, expedited rescission, increased managerial discretion and reduced restrictions in matters such as apportionments, allotments, personnel ceilings, line items, and year-end lapses. In a statement targeted to federal managers, he stressed accountability (Gore 1994, 318): "It is now possible for a president... to decentralize, yet at the same time keep field operations fully informed and accountable for results. It is this concept—accountability—that links the federal manager of the Clinton era to the role of federal managers in earlier eras." Elaborating the concept in a way with obvious implications for budgeting, he writes,

In the old way, federal executives were expected to use hierarchical arrangements, with checks and controls over every input, elaborate reporting mechanisms, and extensive use of rules and regulations.... In the new way, federal executives will be expected to concentrate on performance and carefully measure results—outcomes and outputs, not just inputs (Gore 1994, 320, note omitted).

Parallel recommendations from the National Commission on the State and Local Public Service called for accelerating procurement, eliminating lapses ("spend-it-or-lose-it" budget systems), and making the budgeting process more flexible (Thompson 1993).

Some observers warned that the NPR proposals would "fundamentally shift the relations between Congress and the executive branch" (Fisher and Kliman 1994, 19). While that has not yet occurred, "reinventing" and the NPR received enough attention to warrant, for example, numerous articles in the *Public Administration Review* (Gore 1994), *PA Times*, and an issue of *The Public Manager* (Fisher and Kliman 1994). One achievement is the Federal Acquisition Streamlining Act of 1994, designed to simplify and update notoriously cumbersome and expensive procedures.

In both corporate and governmental settings, TQM and reinvention/reengineering are so closely associated with downsizing that skeptics abound. Indeed, in February 1993, President Clinton issued Executive Order 12839, thereby instructing agencies to cut employment by 5% or approximately 100,000 positions from 1993 to 1995, and saving an estimated \$16 billion through 1998; the NPR translated its recommendations into an additional reduction of 150,000 employees from 1996 to 1999 (CBO 1993a, 2). Note that the NPR is not the only instance of staff cuts; more than 71,000 full-time positions were eliminated and the equivalent of 11,600 full-time workers laid off from 1981 to 1983 (CBO 1993a, 18). With options including attrition, furlough, and reductions in force or RIFs, reducing the civilian workforce is a difficult, complex undertaking that ripples throughout the federal bureaucracy through bumping and other procedures. The NPR's 1995 status report claimed 160,000 federal jobs eliminated, \$58 billion in cost savings, \$70 billion in newly recommended cost savings, and the elimination of numerous federal regulations (Brace 1995, 1).

D. THE 1974 CONGRESSIONAL BUDGET ACT

1. Sources of Reform

The signing of P.L. 93-344, the Congressional Budget and Impoundment Control Act (31 U.S.C. 1331), in July 1974 introduced substantial change in the congressional budget process. New procedures and institutions were established and new information made available. Most importantly, from a historical perspective, the budget act reiterated two preoccupations of US

budgeting: efforts at budgetary control and contention between the executive and legislative branches over budgetary dominance. The events presaging its passage can be compared with the events leading to the 1921 act, from which executive budgeting dates; however,

in two major respects conditions and goals were very different in 1974 as compared to 1921. First, the 1974 act was not only the product of a budget crisis but a constitutional crisis. Involved were the secret and unauthorized use of funds to bomb and invade Cambodia. In addition, money appropriated by Congress for farm and city programs was impounded by President Nixon on a grandiose and unprecedented scale.

Second, in 1974 Congress sought to retrieve power and authority it had delegated to the president (Shuman 1984, 183).

The issue of power and the institutional prerogatives through which power is exercised are preeminent in other analyses of the 1974 act as well (Piffner 1979). One observer writes, "The Constitution notwithstanding, Congress had yielded its power over the purse to the president" (Havemann 1978, 4). Phrasing the issue in terms of impoundments,* Schick (1980, 45) explains that, "More than any of the other budget disputes that racked Congress between 1967 and 1973, the impoundment controversy incited Congress to devise its own budget process."

The Committee on the Budget of the US House of Representatives concurs. "Despite the constitutional restriction that 'No money shall be drawn from the Treasury but in consequence of appropriations made by law,' the Congress had, in the eyes of many, lost the power of the purse to the Executive Branch" (Committee on the Budget 1981, 3). Reviewing the genesis of this act, the Committee's *General Explanation* argues[†] that

The causes were deep and long standing, mirroring in many ways the growth and complexity of American society itself.

First, the size of the Federal budget and its impact on the Nation's economy [emphasis added]. In little more than half a century, the budget had grown from \$3 billion to over \$400 billion; and since the turn of the century, the national debt had risen from \$1 billion to more than \$700 billion....

Second, past budget reform efforts which enhanced and centralized budget authority in the executive branch while permitting increased fragmentation of spending authority within Congress.... [emphasis added]

* "Impoundment" is any "action or inaction by an officer or employee of the US Government that precludes the obligation or expenditure of budget authority approved by Congress" (Committee on the Budget 1981, 119). If unrestricted, its potential effect on policy and programs is comparable to the line-item veto. Schick explains that Nixon's 1972–1973 impoundments "were designed to rewrite national policy at the expense of congressional power and intent" (1980, 46). In contrast to an "impoundment," "rescission" is the "consequence of enacted legislation that cancels budget authority previously provided by Congress before the time when the authority would otherwise lapse (i.e., cease to be available for obligation)" (Committee on the Budget 1981, 128).

† "Controllability" refers to the "ability of Congress and the President to increase and decrease budget outlays or budget authority in the year in question.... Relatively uncontrollable refers to spending that the Federal Government cannot increase or decrease without changing existing substantive law. For example, outlays in any one year are considered to be relatively uncontrollable when the program level is determined by existing statute or by contract or other obligation." Other examples include permanent budget authority; interest on the public debt ("for which budget authority is automatically provided under a permanent appropriation enacted in 1847"); and open-ended entitlement programs mandated by law (Committee on the Budget 1981, 110). Controllable versus relatively uncontrollable spending remained an important issue in the 1970s (Ogilvie, in Penner, 1981, 101–134), and emerged as an important distinction in the sequestration process associated with the 1985 Gramm-Rudman-Hollings Act.

Third, the nature and timing of congressional budget actions [emphasis added]. About 75 percent of the budget was regarded as “relatively uncontrollable” under existing law, and uncontrollables had become the fastest rising part of the total budget. Backdoor spending—that is, spending outside the regular appropriation process—represented more than half of all spending. [emphasis added]

Appropriation bills were seldom completed by the beginning of the fiscal year for which funds were to be provided, causing many Federal agencies to operate on continuing resolutions for part, and in some cases, all of the year.

And Fourth, the increasing use of impoundments by the Executive, which directly challenged Congress’ constitutional power to establish spending priorities [emphasis added] (Committee on the Budget 1981, 3–4).

Placing “the chaos that was congressional budget-making” among “the roots of budget reform,” Joel Havemann quotes Senator Sam J. Ervin, Jr.:

Congress never decides how much total expenditures should be, nor does it go on record as to whether the budget should have a surplus or a deficit. The total seems to just happen, without anyone being responsible for it, or knowing with much confidence what it will be (Havemann 1978, 4).

The 1974 legislation attempted to supplant a fragmented, dispersed, decision-making process with a systematic, coordinated, legislative budget process.

This was not the first attempt to move in this direction. The Legislative Reorganization Act of 1946 called for the adoption of a legislative budget as recommended by a joint committee, but in 1949, after two unsuccessful rounds, the legislative budget was abandoned. The Omnibus Appropriations Bill of 1950 sought to integrate all regular appropriation bills, but the attempt did not survive a second budget year. A Joint Study Committee on Budget Control was established in 1972 as part of legislation on the debt limit, and its 1973 report emerged with significant modifications as the 1974 act.

2. Congressional Budget Process and Procedures

The 1974 act did not provide for a congressional budget per se but for a congressional budget process—a systematic, routine, comprehensive procedure of initial targets, then binding targets, and subsequent reconciliation (see below), all scheduled against the deadline of the rapidly approaching fiscal year. As illustrated by the 1975 concurrent resolution, the budget resolutions were designed principally to elicit agreement on five figures, including total outlays, new budget authority, the deficit, total revenues, and public debt (see Figure 5.8). Together they add up to important, new information in the decision-making process. These numbers mean that the act “required Congress twice each year to do what it had never done before—to decide the totals of the federal budget” (Havemann 1978, 4).

Considering that congressional experience with temporary or partial appropriations dates to at least 1798 (GAO 1986a, 14), the probability was high that the procedural requirements of budget resolutions and timetables would slip into temporary funding measures and piecemeal budgeting. Bipartisan commitment among leaders in both houses held Congress to the procedures for a few years. Factors contributing to the eventual reversion to old habits included the retention of the committee structure (separating appropriations and substantive committees) and the thirteen appropriations bills that needed to be passed, coupled with the diminished authority of the House Ways and Means Committee. GAO’s 1986 study of continuing resolutions states that “Increased reliance on continuing resolutions and the incidence of funding gaps caused by late enactment of appropriations are serious problems associated with decision-making in the federal

Calendar No. 71

94TH CONGRESS
1ST SESSION**S. CON. RES. 32**

[Report No. 94-77]

IN THE SENATE OF THE UNITED STATES

APRIL 15, 1975

Mr. MUSKIE, from the Committee on the Budget, reported the following concurrent resolution; which was ordered to be placed on the calendar

CONCURRENT RESOLUTION

Relating to a determination of the Congressional Budget for the United States Government for the fiscal year beginning July 1, 1975.

- 1 *Resolved by the Senate (the House of Representatives*
 2 *concurring)*, That the Congress hereby determines, pursuant
 3 to section 301 (a) of the Congressional Budget Act of 1974,
 4 that for the fiscal year beginning on July 1, 1975—
- 5 (1) the appropriate level of total budget outlays is
 6 \$365,000,000,000;
- 7 (2) the appropriate level of total new budget au-
 8 thority is \$388,600,000,000;
- 9 (3) the amount of deficit in the budget which is
 10 appropriate in the light of economic conditions and all

V

FIGURE 5.8 1975 Concurrent resolution.

2

1 other relevant factors is \$67,200,000,000 under existing
2 law, and \$69,600,000,000 if the revenue measures re-
3 ferred to in paragraph (4) are extended and enacted;

4 (4) the recommended level of Federal revenues
5 under existing law is \$297,800,000,000 and, if certain
6 provisions of the Federal Tax Reduction Act of 1975
7 are extended to 1976 and additional taxes on energy are
8 enacted, the level of Federal revenues will be \$295,-
9 400,000,000; and

10 (5) the appropriate level of the public debt is
11 \$617,600,000,000 under existing law and \$620,000,-
12 000,000 if the revenue measures referred to in para-
13 graph (4) are extended and enacted.

14 SEC. 2. The Congress, in setting forth the amounts con-
15 tained in the first section of this resolution, estimates that
16 Federal receipts from the leasing of the Outer Continental
17 Shelf for oil exploration purposes will be \$4,000,000,000,
18 rather than the \$8,000,000,000 estimated in the budget sub-
19 mitted by the President. If the \$8,000,000,000 estimated is
20 realized, the deficit set forth in paragraph (3) of the first
21 section is \$63,200,000,000 under existing law and \$65,-
22 600,000,000 if the revenue measures referred to in para-
23 graph (4) of such section are extended and enacted.

FIGURE 5.8 (Continued)

budget process” (GAO 1986a, 10).^{*} The study found that the “resolutions have been used in place of regular appropriations bills and are so broad in scope as to resemble omnibus appropriations bills” (GAO 1986a, 14). With a certain delicacy, the study observed, “The underlying causes for these changes are certain inherent problems in the political decision-making process which affect budget choices” (GAO 1986a, 14).

New institutions were added to supplement the venerable ones already on guard against jurisdictional incursions and responsible in no small measure for the fragmented decision-making characteristic of Congress. The act established committees on the budget in the House and Senate, each with a staff, and a nonpartisan CBO to provide information and analyses on a par with OMB’s (Titles I–II). The CBO not only joined the information industry (see above), but the availability of alternative numbers—predictions, projections, estimates, and “technical adjustments” in the mid-1980s when attention focused on deficit projections—altered the terms and participants of the traditional annual debate (Blustein and Shribman 1986). One of the consequences of the increased administrative capacity and information is that the technical aspects of the discussion put it even further beyond the reach of many, even well-informed, laymen.

The 1974 act laid out a timetable and set procedures for the congressional budget process (Titles III–IV). The Budget and Accounting Act of 1921 and the Legislative Reorganization Act of 1946 and 1970 were amended by the 1974 act, thereby creating a new fiscal year adjusted to begin on October 1, changes in budget terminology, and changes in the information provided in presidential submissions (Titles V–IX). The president was required to submit a “current services” budget as well as a presidential budget.[†] In effect, a new baseline was provided against which to measure spending needs and proposals. The new procedures called for recursive crosswalks between broad functional categories and appropriations committees, in no small measure designed to prevent the usurpation of existing committees’ powers by the budget committees.[‡]

By the terms of the act, prospective new budget authority is reported and the first concurrent resolution or target is completed in mid-May; Congress completes action on new spending and new budget authority in early September; this is followed by the second concurrent resolution (binding target or ceiling) in mid-September (eliminated by the Balanced Budget and Emergency Deficit Control Act of 1985); by the end of the month, prior to the beginning of the new fiscal year, a reconciliation bill or resolution (or both) implements the second concurrent resolution. The resolutions are not laws, do not take presidential signature, and “only” affect Congress internally. According to one assessment,

The congressional budget resolution does not actually create programs or appropriate funds. It is, however, the single most important budget decision Congress makes each year and the foremost expression of congressional spending priorities (Collender 1986, 31).

^{*} “Continuing resolution” refers to legislation providing budget authority for ongoing activities when the regular appropriations are not enacted by the beginning of the new fiscal year. It usually states a maximum rate at which an agency may incur obligations. Although Congress enacts continuing resolutions as joint resolutions, they must be passed by both houses and approved by the president. Procedurally the House’s restrictions on general appropriations do not apply; the Senate considers them to be the same, and standard procedures apply (GAO 1986a, 10–11).

[†] “Current services estimates” refer to estimated “budget authority and outlays for the ensuing fiscal year based on continuation of existing levels of service... ignoring all new initiatives, presidential or congressional that are not yet law. These estimates of budget authority and outlays, accompanied by the underlying economic and programmatic assumptions upon which they are based (such as the rate of inflation, the rate of real economic growth, the unemployment rate, program caseload, and pay increases) are required to be transmitted by the President to the Congress with the President’s budget” (Committee on the Budget 1981, 111).

[‡] “Crosswalk” is any “procedure for expressing the relationship between budgetary data from one set of classifications to another, such as between appropriation accounts and authorizing legislation or between the budget functional structure and the congressional committee spending jurisdictions” (Committee on the Budget 1981, 111).

The 1974 act also spelled out procedures for congressional review of presidential impoundments (Title X), which had been the source of sufficient contention to lead to court action; this conflict peaked during the Nixon Administration in 1972. The impoundment procedures established by the act are comprised of four elements: an executive report to Congress of the budget authority permanently or temporarily withheld from obligation or expenditure; the release of proposed rescissions if Congress fails to approve within 45 days, meaning that no action is necessary to uphold existing statutory budget authority; the progression of deferrals if Congress fails to override, though either house may release funds by passing a resolution; and the empowerment of the comptroller general to seek court enforcement. According to one assessment, “The system has worked reasonably well until relatively recently” (GAO 1986d, 2). In 1983, as a result of the Supreme Court’s decision in *Immigration and Naturalization Service v. Chadha*, the one-house veto provision lost reliability. Consequently, deferrals were disapproved by legislative enactment and impoundments continued to be a source of congressional frustration and executive-legislative friction.

3. Reconciliation

Ironically, while the 1974 budget act did indeed realign the balance of budgetary power between the branches and initiate an era of legislative budgeting, it also set in place the reconciliation procedure used by President Reagan and OMB Director David Stockman to capture the 1981 budget round by converting a congressional procedure into a presidential tool. Reconciliation initially provided for the House and Senate Budget Committees to instruct their appropriations committees to come up with cuts or revenues to meet the second concurrent resolution’s binding targets. Reconciliation was changed in 1980 so that it could be brought into play as a part of the first budget resolution, at the beginning of the process. This is precisely what occurred in the Omnibus Reconciliation Act of 1981 (Collender 1986, 39–42; CRS 1981; Shuman 1984, 246–274; Stockman 1986). (By virtue of the 1985 act, reconciliation instructions are mandatory in the budget resolution (Collender 1986, 40).)

The only balance that was addressed was that between the branches (although statutory requirements for a balanced budget had previously been passed (Ceilings 1975; Stine 1985, 2038).^{*} The act also set the stage for the next change in federal budgeting, the passage of the Balanced Budget and Emergency Deficit Control Act in 1985, by not attending to the economic aspect of control, by not providing for a mechanism to deal with deficits or debt, and by not introducing mechanisms or incentives for prudence if not balanced budgets (Wildavsky, in Penner 1981, 87–100).

E. THE GRAMM-RUDMAN-HOLLINGS ACT OF 1985

1. Sources of Reform

On December 12, 1985, the president signed P.L. 99–177, the Balanced Budget and Emergency Deficit Control Act, commonly referred to as the Gramm-Rudman-Hollings Act (GRH). This was the response of the 99th Congress to the increasing imbalance between federal revenues and expenditures and the pressure to do something about deficits. What Congress did was to amend the Congressional Budget and Impoundment Control Act of 1974 via an amendment to legislation on the debt ceiling. The structural and political circumstances behind passage have been called “America’s great consumption binge” (Courant and Gramlich 1986), and can be traced to any or all of the following: tax cuts and indexing that reduced revenues; increased spending on defense and

^{*} Because the 1985 act had no automatic revenue consequences, the deficit ceiling, in effect, became a spending ceiling. Tracing earlier efforts at controlling spending from fiscal 1968 through 1976, one assessment concluded that “spending ceilings have a record of consistent failure as a means of controlling the growth of federal spending” (Ceilings 1975, 1624).

interest combined with inadequate cuts in other areas; economic conditions that failed to support the demands made on the federal treasury in response to demographic and other changes; and a lack of political will. If the issue can be reduced to one number, it is an impressive one; the statutory limit on the public debt was raised to over \$2 trillion in the fall of 1985. The purpose of the 1985 act was to reduce the federal deficit by interim targets to zero by fiscal year 1991. If the issue is one of perception, then the sense of pressure is communicated by Senator Domenici's statement in the *Congressional Record* of December 11, 1985. He remarked,

I think the American people sense that something evil is occurring right now, if we cannot get the deficit down. That is why they support this legislation.... It [GRH] is not the greatest way to manage a magnificent country. But we have political gridlock at this point, and the existing processes of our Government, executive and legislative, invite the continuation of the gridlock (S 17386).

2. Deficit Ceiling and Sequestration

The major provisions raised the debt limit, established deficit ceilings (in presidential submission as well), revised the budget process and accelerated the timetable, and required budget cuts to achieve the set deficit limits. In the words of the act, "The term 'deficit' means, with respect to any fiscal year, the amount by which total budget outlays for such fiscal year exceed total revenues for such fiscal year." The act required the president to submit a budget with a deficit in line with the maximum specified for that fiscal year, and required Congress to proceed similarly on its budget resolution, which was to include reconciliation instructions.

The deficit reduction procedure was to be triggered by deficit estimates, an automatic feature that was designed to substitute for political will and deliberation. (With Social Security removed from the budget for all purposes except calculating the deficit and all other off-budget entities now on the budget, the reach of the "unified" budget was altered (Schick 1986, 21) If the deficit was projected to exceed the target established for each of the five years until reaching zero in FY 1991, then automatic, across-the-board reductions (substituting for program-by-program decisions) would occur unless other selected cuts were made. One-half of the cuts were to occur in defense and one-half in domestic programs, although the interest on the national debt, Social Security, Medicaid, Aid to Families with Dependent Children Food Stamps, veterans' pensions, Supplemental Security Income, and other programs were completely exempted or protected by limited percentage cuts (Schick 1986).

The automatic deficit reduction mechanism was "sequestration," meaning permanent cancellation of budget authority and budgetary resources. Some saw it as possibly "the most innovative, far-reaching, and controversial change in the congressional budget process" (Collender 1986, 49). It was mandatory, nondiscretionary, and followed upon the issue of a sequester order by the president (see Figure 5.9).

Sequestration was triggered five times from 1986 to 1993, "once each for fiscal years 1986, 1988, 1990, and twice for fiscal 1991. The sequestration reductions made for fiscal year 1986 were voided by court action and later reaffirmed, the reductions for fiscal year 1988 were later rescinded, the reductions for fiscal year 1990 were modified substantially, and the reductions for fiscal year 1991 were applied in one instance to domestic discretionary programs and in another to international discretionary programs (the latter reductions were later rescinded)" (Committee on Ways and Means 1993, 84).

3. Constitutional Issues

Serious constitutional questions were raised about the provisions of the 1985 act and the procedures under which it was adopted (CRS 1985; Hoadley 1986). The constitutional insistence on separation of powers exerted its force on the federal budget process again when in 1986, in *Bowsher v. Synar*

SECTION 10—OVERVIEW OF THE BUDGET PROCESS

MAJOR STEPS IN THE FORMULATION PHASE

What happens?	When?
OMB issues Spring planning guidance to Executive Branch agencies for the upcoming budget. The OMB Director issues a letter to the head of each agency providing policy guidance for the agency's budget request. Absent more specific guidance, the outyear estimates included in the previous budget serve as a starting point for the next budget. This begins the process of formulating the budget the President will submit the following February.	Spring
OMB and the Executive Branch agencies discuss budget issues and options. OMB works with the agencies to: Identify major issues for the upcoming budget; Develop and analyze options for the upcoming Fall review; and Plan for the analysis of issues that will need decisions in the future.	Spring and Summer
OMB issues Circular No. A–11 to all Federal agencies. This Circular provides detailed instructions for submitting budget data and materials.	July
Executive Branch agencies (except those not subject to Executive Branch review) make budget submissions. See section 25.	Fall*
Fiscal year begins. The just completed budget cycle focused on this fiscal year. It was the "budget year" in that cycle and is the "current year" in this cycle.	October 1
OMB conducts its Fall review. OMB staff analyze agency budget proposals in light of presidential priorities, program performance, and budget constraints. They raise issues and present options to the Director and other OMB policy officials for their decisions.	October–November
OMB briefs the President and senior advisors on proposed budget policies. The OMB Director recommends a complete set of budget proposals to the President after OMB has reviewed all agency requests and considered overall budget policies.	Late November
Passback. OMB usually informs all Executive Branch agencies at the same time about the decisions on their budget requests.	Late November
All agencies, including Legislative and Judicial Branch agencies, enter MAX computer data and submit print materials and additional data. This process begins immediately after passback and continues until OMB must "lock" agencies out of the database in order to meet the printing deadline.	Late November to early January *
Executive Branch agencies may appeal to OMB and the President. An agency head may ask OMB to reverse or modify certain decisions. In most cases, OMB and the agency head resolve such issues and, if not, work together to present them to the President for a decision.	December *
Agencies prepare and OMB reviews congressional budget justification materials. Agencies prepare the budget justification materials they need to explain their budget requests to the responsible congressional subcommittees.	January
President transmits the budget to the Congress.	First Monday in February

*OMB provides specific deadlines for this activity.

FIGURE 5.9 Federal Budget Process, 2004. (From OMB, Revisions to OMB Circular No. A-11, July 2004, <http://www.whitehouse.gov/omb/circulars/a11/04toc.html>.)

SECTION 10—OVERVIEW OF THE BUDGET PROCESS

MAJOR STEPS IN THE CONGRESSIONAL PHASE

What happens?	When?
Congressional Budget Office (CBO) reports to Budget Committees on the economic and budget outlook.	January
CBO reestimates the President's Budget based on their economic and technical assumptions.	February
Other committees submit "views and estimates" to House and Senate Budget Committees. Committees indicate their preferences regarding budgetary matters for which they are responsible.	Within 6 weeks of budget transmittal
The Congress completes action on the concurrent resolution on the budget. The Congress commits itself to broad spending and revenue levels by passing a budget resolution.	April 15
The Congress needs to complete action on appropriations bill for the upcoming fiscal year. The Congress completes action on regular appropriations bills or provides a "continuing resolution" (a stop-gap appropriation law).	September 30

MAJOR STEPS IN THE EXECUTION PHASE

What happens?	When?
Fiscal year begins.	October 1
OMB apportions funds made available in the budget process and other available funds. Agencies submit apportionment requests to OMB for each budget account by <i>August 21</i> or within <i>10 calendar days</i> after the approval of the appropriation, whichever is later. OMB approves or modifies the apportionment specifying the amount of funds agencies may use by time period, program, project, or activity.	September 10 (or within 30 days after approval of a spending bill)
Agencies incur obligations and make outlays to carry out the funded programs, projects, and activities. Agencies hire people, enter into contracts, enter into grant agreements, etc., in order to carry out their programs, projects, and activities. Agencies record obligations and outlays pursuant to administrative control of funds procedures (see Appendix H), report to Treasury (see the Treasury Fiscal Requirements Manual and section 130), and prepare financial statements.	Throughout the fiscal year
Fiscal year ends.	September 30
Expired phase (no-year funds do not have an expired phase). Agencies disburse against obligated balances and adjust obligated balances to reflect actual obligations during the period of availability. Agencies continue to record obligations and outlays pursuant to administrative control of funds procedures, report to Treasury, and prepare financial statements.	Until September 30, fifth year after funds expire.

FIGURE 5.9 (Continued)

(106 S. Ct. 3181), the Supreme Court invalidated the automatic trigger mechanism for sequestration as violating the separation of powers. The effect of the court invalidation was contained because the act included a severability clause and provided for legislative enactment as an alternative route.

4. GRH II and III

The Balanced Budget and Emergency Deficit Control Reaffirmation Act (P.L. 100-119), passed in 1987 with the debt limit extension as the legislative vehicle, amended the 1985 GRH to reset deficit reduction targets. Budgetary balance was postponed to 1993. The automatic sequestration trigger was restored, this time with responsibility assigned to OMB. Following the stock market's plunge in October 1987, successful executive–legislative negotiations led to a two-year budget agreement.

GRH was yet again revised in 1990 (GRH III). The president and the Congress agreed to abandon the GRH II targets. Although the new system of deficit reduction was built on a more solid foundation and was more realistic, it was still labeled as “extremely complicated” by Donald F. Kettl and contained more realistic targets, including (Kettl 2003, 113–116):

1. Separate spending ceilings were established for the three major discretionary programs such as defense, international programs including foreign aid, and domestic programs.
2. The financing of the social security programs were separated from other parts of the budget through a so-called “firewall.”
3. The overall deficit targets of the previous GRHs were reduced to \$82 billion for FY1985.
4. Federal direct loan and loan guarantee credit programs, previously rarely included fully on the budget, were now required to be fully recorded on the budget and were part of the ceilings.
5. Congress was forbidden to make program changes that exceeded the ceilings within program categories.
6. The Office of Management and Budget became the scorekeeper for determining whether spending was kept within the ceiling or not.

F. THE BUDGET ENFORCEMENT ACTS OF 1990 AND 1997

Passed in 1990, the Budget Enforcement Act (BEA; Title XIII of the 1990 Omnibus Budget Reconciliation Act) made major changes in the 1974 and 1985–1987 budget reforms (see Table 5.1). The Congressional Research Service’s summary (Davis 1991, 1) states:

The major purpose of the Budget Enforcement Act is to establish temporary procedures to enforce the deficit reductions made by the 1990 Reconciliation Act and other laws, but the Act makes other permanent changes in budget procedures as well. The Budget Enforcement Act establishes discretionary spending limits for FY 1991–1995 and requires direct spending and revenue legislation to be deficit neutral (under a process referred to as “pay-as-you-go”) throughout the same period. In general, if discretionary spending exceeds any of the established limits for a fiscal year, or direct spending (mainly entitlement) or revenue legislation increases the deficit, so-called “mini-sequesters” will be triggered at the end of the congressional session to reduce spending across-the-board within the affected categories. The Act also revises and extends the Gramm-Rudman-Hollings deficit targets through FY 1995, and removes Social Security from the sequestration deficit calculations.

The BEA shifted gears from fixed deficit limits to spending control. It created new deficit controls based on variable deficit targets, and caps on discretionary spending (subject to annual appropriations, including defense) enforced through revised sequestration procedures (mini-sequesters). Revenues and direct or backdoor spending (meaning spending outside

appropriation committees' jurisdiction and determined by substantive legislation) were subject to the pay-as-you-go rule to ensure deficit neutrality.

Exemplifying the possibilities and complexities associated with off-budget financing, Social Security trust funds, off-budget since 1985, were counted in sequestration deficit estimates under BEA, while benefits were exempted from sequestration reduction (Davis 1991, 7). In other words, the BEA reaffirmed Social Security's off-budget status and removed the trust funds from deficit estimates in the sequestration process (see Collender (1992 and later), and Schick (1995) for detailed descriptions of the BEA and its application). The debate over BEA was revived later when the problem of budget deficit was so central that President Clinton signed The Balanced Budget Act (BBA 1997) to balance the federal budget by FY2002. The two most important aspects of BEA 1990—discretionary spending limit caps and pay-as-you-go (PAYGO) requirement—are also at the center for BBA 1997. The latter permitted more discretionary spending under the limits such as defense and non-defense for FY1998 and FY1999; violent crime reduction for FY1998–FY2000; and discretionary (a single category) for FY2000–FY2002.

The major points of BEA 1997 are summarized as follows (H.R. 898—Balanced Budget Enforcement Act of 1997):

1. The bill sets deficit reduction targets in addition to the amounts required by then-current law to reach balance in 2002.
2. The bill sets the institutional framework for sound economic estimates by establishing the Board of Estimates, consisting of the Chairman of the Federal Reserve and four private citizens nominated by House and Senate party leaders. The board must choose either the CBO's or the OMB's estimates of how much deficit reduction is needed in that legislative session. The Board's choice would be binding on the president and Congress, so that the deficit reduction requirement for each would be identical. Finally, the Board would meet again after adjournment to pick either CBO's or OMB's estimates of how much deficit reduction was actually accomplished by Congress during the Session.
3. The bill requires the president to submit a balanced budget and propose a budget that would reach balance by 2002.
4. Finally, the bill requires budget committees to report balanced budget and the congressional budget resolution must lay out a plan to reach balance by 2002. Under the bill, budget resolutions must use the estimating assumptions chosen by the Board of Estimates, meet all discretionary caps and entitlement and/or revenue deficit reduction targets, and achieve balance by 2002 and each year thereafter (<http://www.house.gov/visclosky/hr898.htm>).

Although there was substantial support for a balanced budget in theory, there are negatives to consider as well:

A balanced budget rule could make it even harder to conduct discussions of policies on their own merits, and could lead to distortions of policies simply to meet budget goals... [In addition,] burdens might be shifted to state and local governments (through unfunded mandates) or to the private sector (through regulation or trade policy) even when the public good would be enhanced by keeping the programs at the federal level. And spending cuts that would result in immediate savings most likely would be made first, without much consideration of the long-run merits of the programs. Major deficit reduction surely entails spending cuts, but the reductions should be based on the long-run effectiveness of the benefits provided, not on meeting a rigid annual dollar target (Reischauer 1992).

Several seasoned participants in the budget process have noted the major reasons why, although a balanced budget commonly is thought of as a good idea, a constitutional amendment requiring balanced budget may not be (Greenspan 1997). Robert Greenstein, founder and executive director of the Center on Budget and Policy Priorities, underscore the political and financial role of budget

deficits. A balanced budget amendment would: heighten the risk of recession by disallowing deficits to stimulate the economy for purposes of fiscal policy; increase the risk of default on US debt; enable congressional minorities to hold the Congress hostage if the amendment requires a supermajority (e.g., three-fifths) to approve a deficit; contradict intergenerational equity by shifting the Medicare and Medicaid burdens onto future taxpayers; make it harder to raise revenues and close tax loopholes that cut programs and thereby shift the tax burden to the middle class and the poor and away from the wealthy; and represent a risk to the banking system if the Federal Deposit Insurance Program could not make insurance payments in a banking crisis (Greenstein 1997).

According to Collender's view, the BBA was not a radical departure from BEA by any means. The BBA became anachronistic and inappropriate in his view when the budget deficit turned into surplus during fiscal year 1998 (Collender 1999, 24).

G. THE ELUSIVE BALANCED BUDGET

1. Resistance to Budget Reform

The reforms of the Reagan and Bush administrations did not succeed in achieving the fundamental goals of deficit reduction and budgetary balance. The deficit exceeded GRH targets for each fiscal year from 1985 to 1990. With a zero deficit easier to achieve in the future because current political agreement could be purchased with postponed political costs and programmatic cuts, budgetary balance became a moving target. In the 1985 GRH, the target date was 1990; the 1987 revised target pushed the deadline to 1993. The BEA again revised deficit targets for fiscal 1991–1995 and did not specify a target date for achieving a zero deficit (and the changed treatment of Social Security trust funds in effect enlarged the targets). When submitting his budget proposals in 1993 and 1994, President Clinton took the opportunity provided by the BEA rules to adjust the maximum deficit amount in accord with economic and technical assumptions. Moreover, during the 1995 budget stalemate, advocates pushed for their preferred target dates for a balanced budget—2002 or 2005—and budgetary balance was again a fundamental goal to be deferred.

2. Political Significance

Accumulated deficits translate into national debt, which historically has played an important role in US politics. In fact, the debt as a contentious issue dates back to the republic's founding and the Assumption Plan. The United States completely paid off the national debt only once, in the second term of President Andrew Jackson (Watson 1990, 162). For state and local governments, budgetary balance is viewed as the chief disciplinarian, "the most important constraint on budgeting" (Rubin 1993, 164).*

Public opinion polls trace public support for balanced federal budgets for over half a century. When in 1936 the Gallup Poll posed the question, "Do you think it necessary at this time to balance the budget and start reducing the national debt?" 70% of respondents answered affirmatively. The preferred tactic to accomplish this was governmental economies, favored by 80% of poll respondents (Gallup Poll 1972, 12, survey 16). In 1953, a majority of respondents favored balancing the federal budget, even in preference to tax reductions (Gallup Poll 1972, survey 510-K). In 1976, 78% of respondents indicated that they favored a constitutional amendment to balance the federal budget (Gallup Poll 1978, 679, survey 947-K). Similar questions on balancing the federal budget were posed in 1980, when 67% favored the amendment (Gallup Poll 1981, survey 150-G), and again in 1985, when support fell to 49% of respondents (Gallup Poll, 1986, special telephone survey). Respondents were asked in March 1995 whether they "favor or oppose a balanced budget amendment to the U.S. Constitution," and 71% responded in favor (Public Opinion Online, question 026). But consider that when, in January 2002, Gallup asked, "Which of the following comes closer to

* On budgetary balance at the subnational level, see especially Cranford 1992; GAO 1993a; Lewis 1994; National Association of State Budget Officers 1992; Rubin 1993, 164–206; and Snell 1993

your view of the budget deficit—the government should run a deficit if necessary when the country is in a recession and is at war, or the government should balance the budget even when the country is in a recession and is at war?,” 51% of respondents opted for a necessary deficit, compared to 46% preferring a balanced budget (and 3% indicating no opinion).

What is noteworthy about federal budgetary imbalance in contemporary politics is its repetition each year for over a generation and the size and attributed impact of the accumulated national debt. Also, net interest payments accounted for approximately 14% of federal outlays by the mid-1990s. As annual deficits soared and the national debt accumulated over the past decade, raising the debt limit and reducing the deficit increasingly dominated the budget debate. The legislative vehicle for both 1985 and 1987 GRH versions was an extension of the debt limit (initiated when Congress delegated authority to borrow under the Liberty Bonds Act of World War I). “[T]he politics of budget making was the central preoccupation of the Reagan presidency,” and “the budget policies of the Reagan years are directly responsible for the deficit-driven agenda.... of George Bush’s presidency.... [B]udget problems remain in the center—and at the bottom—of most Washington debates in the 1990s” (Fenno 1991, ix–x). Balancing the budget and/or limiting its growth also dominated the Clinton administration’s budgets and domestic policy (see Figure 5.9).^{*} Driven by a downturn in income tax receipts, the 2001 tax cuts, and the cost of war, the deficit scenario was repeated at the beginning of the twenty-first century. The turnabout was from a surplus of 1.1% of GDP in 2000 to a deficit of –2.8% of GDP in 2003 and CBO’s projections (<http://www.cbo.gov/showdoc.cfm?index=1944&sequence=0#table1>) show an accumulated deficit in 2004–2009 topping \$1.5 trillion. According to OMB, the 40-year historical average for the deficit is 2.2% of the GDP (see Figure 5.10). The concern over the federal deficit continues to sound at a roar in the popular press, including major daily newspapers, and Washington sources such as the Congressional Quarterly (<http://www.cq.com/corp/login.do?jumpto=http%3A//www.cq.com/home.do>) and National Journal (www.nationaljournal.com).

3. Constitutional Amendments

Among the several tools of budgetary balance are deficit reduction through specified, scheduled targets (described above), spending cuts and spending caps, the line-item veto, and proposals to amend the Constitution to require a balanced budget (see Table 5.1). An amendment calling for a balanced budget was approved in the Senate in 1982, but not in the House. In 1990, President Bush’s budget proposal included a constitutional amendment for a balanced budget. That same year, and for the second time in its history, the US House of Representatives considered a balanced budget amendment to the Constitution, but the joint resolution failed to muster the requisite two-thirds majority. Also in 1990, the Senate Judiciary Committee reported out a balanced budget amendment, and the BEA redirected efforts from deficit reduction to spending control. Multiple versions of balanced budget amendments were proposed in 1992, but failed to pass Congress (A Balanced Budget Amendment 1992). In 1994, 376 Republican candidates, including many congressional candidates, signed on to support the *Contract with America* (Gillespie and Schellhas 1994), which included a commitment to a constitutional amendment requiring a balanced budget, but the amendment failed to pass in 1995. The debt ceiling again occupied center stage in 1995, and this time was hostage to a budget standoff marked by executive–legislative conflict, partisan

^{*} On the Reagan and Bush administrations, see especially Collender 1983–1992; Fenno, 1991; Franklin, 1993; Schick 1995; Shuman 1992; White 1988; and Wildavsky 1992. On the Clinton administration, see Collender 1993–1998, 2000; Kettl 1995, 2003; Kettl and Dilulio 1995; and Schick 1995. On the George W. Bush administration, see Stanley Collender’s column, *Budget Battles*, in the National Journal (<http://nationaljournal.com>). See also annual articles on the president’s budget in *Public Budgeting & Finance* and the many resources available through the Brookings Institution (<http://www.brookings.edu>), Tax Foundation (<http://www.taxfoundation.org>), Washington Post (<http://www.washingtonpost.com>), among others.

FIGURE 5.10. Changing federal budget priorities. Growth rates exclude supplemental appropriations. Supplementals increase defense and homeland security growth rates dramatically (these categories received 90% of supplemental funding). (From OMB, Overview of the President’s 2005 Budget, Dec. 1, 2004 <http://www.whitehouse.gov/omb/budget/fy2005/overview.html>.)

contention, and notably different domestic political agendas. After his electoral victory in 2004, President George W. Bush and the Republican majority in Congress raised the debt limit in anticipation of higher deficits.

4. Line-Item Veto

Many presidents, including Reagan, Bush, and Clinton, have advocated giving the chief executive the authority to veto portions of appropriations bills as another tool to reduce pork-barrel spending and therefore, under current conditions, the deficit. The *Contract with America* (Gillespie and Schellhas 1994) included the line-item veto power among its objectives. Varying in specifics, this executive power is held by numerous governors and subnational chief executives.

Evidence of public support for giving the president the line-item veto dates at least to 1945, when 57% of respondents answered affirmatively to the Gallup Poll’s survey question (Gallup Poll 1972, survey 356-K). In January 1995, the Gallup Poll asked, “Do you favor or oppose giving the President a line-item veto, which would allow him to reject individual parts of a spending bill, rather than having to accept or reject the entire bill as current law requires?” Fully 73% responded in favor, 20% opposed (and 7% don’t know) (Public Opinion Online, question 005).

Congress has guarded its appropriating prerogatives against presidential rescissions and impoundments, effectively another vehicle to the same end. Presidential refusal to spend monies appropriated was a major factor in the adoption of the 1974 budget reform. After a serious debate over constitutional and other issues, the line-item veto was defeated in Congress in 1995, then subsequently enacted.

The use of line-item veto as a tool in reducing deficit is quite controversial. Governors in forty-three states have been using line-item veto but there is no clear evidence that it cut spending in an efficient way (Calmes and Barrett 1996). Moreover, pork-barrel spending itself, against which line-item veto is geared toward, plays an important role in budgetary politics. Donald F. Kettl notes,

Often such projects are the glue that holds together congressional compromises and the deals that presidents strike with members of the Congress.... If the president were to promise all such projects, the loss of this glue of compromise would make it far harder to produce key legislative packages (Kettl 2003, 188).

The symbolic meaning and the prospective political ramifications of the Line Item Veto Act of 1996 (P.L. 104-130) was much more important than its actual potential to reduce the deficit.

It authorized the president to cancel discretionary budget authority, new entitlements, limited tax benefits, and raised constitutional and statutory questions.

The life of the presidential line-item veto was short and US District Court Judge Thomas Hogan declared it unconstitutional on February 12, 1998. The case, *Clinton v. City of New York*, 524 US 417 (1998), argued that the presidential power to unilaterally amend or repeal parts of statutes that had already been accepted violated the Presentment Clause of the Constitution that prescribes a specific process for enacting a statute. Decisions over spending priorities have thus been placed back into the hands of Congress.

5. The Death of Sacred Cows

The paradox of efforts aimed at budgetary balance and deficit reduction is that they reveal both the power and impotence of the contemporary budget process. Allen Schick has described it as a more powerful, more encompassing budgetary process, but one constrained by “zero-sum competition for scarce federal dollars,” in which historical priorities preempt current choices (Association for Budgeting & Financial Management 1994, 2). The title of GAO’s *Budget Policy: Prompt Action Necessary to Avert Long-Term Damage to the Economy* (1992a) testified to an emerging and alarmed preoccupation with a problem that was increasingly framing public policy debates.

The consensus broadened and deepened around the proposition that almost three decades of annual budgetary imbalance and the resulting aggregate public debt were unsustainable and undesirable. In his budget message for fiscal 1994, President Clinton noted, “To ensure that our children’s generation is not the first generation of Americans to do worse in life than their parents, we must restore the American dream.” Tightening budget constraints pushed the expansion of politically admissible remedies, and policy options, and programs once deemed untouchable—the so-called sacred cows—came under scrutiny.

The GRH and BEA protected entitlement programs by according them special status under budgetary procedures such as sequestration. Their political status was undoubtedly related in part to electoral arithmetic. According to Census data, in 1980 almost 47 million people or 20.5% of the US population received Social Security or Aid to Families with Dependent Children (AFDC) benefits. By 1992 the 55.5 million beneficiaries of these two programs represented almost 22% of the population. This means that more than one in every five residents was a direct recipient of one of these two entitlements.

The CBO’s report to the Senate House Committees on the Budget, *Reducing the Deficit: Spending and Revenue Options*, is published annually. A comparison of the 1989, 1993, and 1995 reports suggests some significant shifts in the budgetary agenda. In 1989, the relatively few options laid out for consideration focused primarily on program reductions; outlay options included decreasing public consumption, devolution of programs to states and localities, and progressive redistribution; revenue options included broadening the income tax base, increasing its rate, and increasing the use of consumption taxes and user fees. By 1993, the CBO presented a far larger array and the focus had expanded to add termination options (which would recur in 1995). Attention in the 1993 report turned to discretionary spending, the item veto, spending caps, and cuts in formula-driven programs. Along with terminations and reductions, the 1995 report also

examined the enforcement of BEA's existing limits on discretionary spending, the possibility of increasing efficiency through restructuring, and a balanced budget plan to reduce the deficit to zero by 2002. The number of options for terminating entitlements was five in 1989, 13 in 1993, and 13 in 1995; there were eight reduction options for entitlements 1989, 21 in 1993, and 19 in 1995.

The CBO options illustrate how once-protected programs surfaced as analytical, if not political, options by the early 1990s. The entitlements' emergence as potential targets was pushed by budgetary arithmetic: direct payments to individuals were projected to reach almost one-half of all federal outlays by mid-decade. The budget process was captured by budget cutters, and the advocacy role was left by and large to nonauthoritative players, such as public interest organizations and lobbyists. In his budget message for fiscal year 1995, President Clinton claimed cuts in approximately 340 discretionary programs in 1994 and proposed cuts in approximately 300 nondefense programs, including termination of more than 100 programs. Describing this "spending restraint" in his budget message of February 2, 2004, President George W. Bush said,

We must continue to evaluate each Federal program, to make sure that it meets its goals, and produces the desired results. I propose to hold discretionary spending growth below four percent, less than the average rate of growth of American family incomes. And spending unrelated to defense and homeland security will be held below one percent growth—less than the rate of inflation—while continuing to meet education, health care, and other priorities of this Nation.

6. Spending Cuts through Devolution: Block Grants

Replacing existing federal programs or grants, block grants represent a compromise between a wholly federal response to a national problem and federal withdrawal from a policy arena. Block grants were pivotal to congressional efforts to reduce the federal government's role in domestic policy in 1995, when three major entitlements (Medicaid, food stamps, and AFDC) were revamped into proposed block grants by the Republican Congress. Although the first block grant was enacted under President Johnson, most are associated with Republicans. President Nixon succeeded in establishing two block grants as part of his new federalism. In 1981 President Reagan led the effort to consolidate more than 50 categorical grants into nine block grants. Spending increased in real terms for only two of the nine from 1983 to 1993. Although block grants account for only \$32 billion of the \$206 billion and 15 of the 593 federal aid programs to the states by 1993, they are likely to play a larger role in federal aid to the states (Gold 1995a; see also GAO 1995a).

H. BUDGET SURPLUS AND ITS DISAPPEARANCE

1. The Federal Budget Surplus of 1999–2001

The late 1990s brought something much unexpected to the history of the US federal budget: FY1998 saw a budget surplus for the first time in 29 years. The Congressional Budget Office reported around \$70 billion surplus instead of the projected \$5 billion deficit in 1998. Surpluses resulted in the next three fiscal years, through FY2001. The surpluses cannot be attributed to the success of any specific budgetary concept. Instead, it is largely derived from the economic boom of the late 1990s. Nevertheless, the end of the Cold War, tax changes, and caps on discretionary spending set forth in the 1997 Balanced Budget Act had contributed to the surpluses to some extent. There was an important change in the regular workings of the federal budget for these years: revenues grew beyond predictions and outlays decreased.

With regard to the 1999 budget surplus, Wildavsky and Caiden (2004, 207) mention that the growth of entitlement spending slowed down more than expected as early as 1996. While Medicaid, for example, was exploding at 20–30% per year in 1990–1992, by 1996 the growth slowed considerably to 3%. Discretionary spending also slowed down during these years.

The budget surplus was greeted with great fanfare, but most observers recognized that it was unlikely to last long, especially given the looming retirement of the baby-boomer generation. According to one prediction by the CBO (2000, 2–3), the cumulative on-budget surplus could total nearly \$2 trillion in the next ten years. In the spirit of the predicted bright future, Congress started to spend more. The year 2001 was marked by pork-barrel projects at a record high of approximately \$24 billion.

Robert D. Reischauer, President of the Urban Institute and the Director of the Congressional Budget Office in 1989–1995, warned lawmakers relatively early of the dangers of losing the surplus if it was accompanied by a splurge in spending. In a *New York Times* article entitled “The Phantom Surplus,” Reischauer noted that the “surplus will materialize only if Congress adheres to the spending caps enacted in 1997 or freezes discretionary spending for 10 years” (Reischauer 2000, A27).

After four years with surpluses, the undisciplined spending spree and an economic downturn ended the budget surplus. Tax cuts compounded the problem. Taking office in 2001, President George W. Bush proposed a significant tax cut for FY2002. It was not surprising that a president would propose a \$1.6 trillion dollar 10-year tax cut when experts predicted a multi-trillion dollar surplus. Some analysts argue that the 2001 tax cut proved unwise in the long run (Wildavsky and Caiden 2004, 213). The idea to cut taxes and preserve the surplus at the same time was a low-risk choice, given that increased revenues were the main reason for the surplus. Moreover, George W. Bush promised not to touch the off-budget Social Security part of the surplus. In addition to the tax cut and the slowing down of the economy, the terrorist acts of September 11, 2001 triggered a new emergency spending bill of \$40 billion to defend the country and fight terrorists abroad. Quickly, the budget surplus of 1998–2001 was history.

2. What Happened to the Surplus? The Reemergence of Federal Budget Deficit

Wildavsky and Caiden (2004, 215) point out that, with his budget for fiscal year 2003, President Bush returned to deliberate deficit spending without even trying to balance the budget to increase defense, bolster homeland security, and stimulate the economy. However, Bush’s earlier tax cut was untouched. Although the economy improved during 2004, according to the congressional testimony of Alan Greenspan, Chairman of the Federal Reserve Board, early in 2004, a better economic outlook will not be likely to translate to a smaller deficit in the near future:

This favorable short-term outlook for the U.S. economy, however, is playing out against a backdrop of growing concern about the prospects for the federal budget. As you are well aware, after having run surpluses for a brief period around the turn of the decade, the federal budget has reverted to deficit. The unified deficit swelled to \$375 billion in fiscal 2003 and continued to widen in the next several fiscal years. According to the projections from the Administration and the Congressional Budget Office (CB), if current policies remain in place, the budget will stay in deficit for some time (Greenspan 2004).

The fact that baby boomers will reach retirement age starting in 2008 and become eligible for Medicare and Medicaid remains the major reason for anticipating increasing budgetary pressure. Although in 2004, federal outlays under Social Security and Medicare amounted to less than 7% of GDP, the CBO projected that these outlays will increase to 12% of GDO by 2030 under then-current law. The future will require serious rethinking of the role of the federal government in providing medical services and how those are paid for. Greenspan’s testimony on future budget deficits and how to handle them point out a very important aspect of the politics of the federal budget:

The one certainty is that the resolution of this situation will require difficult choices and that the future performance of the economy will depend on those choices. No changes will be easy, as they all will involve lowering claims on resources or raising financial obligations. It falls on the eCongress to determine how best to address the competing claims. In doing so, you will need to consider not only

the distribution effects of policy change but also the broader economic effects on labor supply, retirement behavior, and private saving (Greenspan 2004).

3. The Federal Budget and Homeland Security

The terrorist attacks of September 11, 2001 fundamentally changed many federal budget priorities (see Figure 5.11). The fear that such events can happen again triggered a multifaceted government response often referred to as homeland security. The CBO defines homeland security as “a concerted national effort to prevent terrorist attacks within the United States, reduce America’s vulnerability to terrorism, and minimize the damage and recover from attacks that do occur” (Office of Homeland Security 2002, 2). However, the funding of Homeland Security reveals a very complex web of activities split among 200 different appropriation accounts. For FY2004, the Congressional Budget Office estimated that \$41 billion dollars were dedicated to these activities (see Figure 5.9).

I. OVERVIEW

Prevailing federal budget dynamics reflect a cumbersome process built up layer by layer, institution by institution, and procedure by procedure over two centuries. Each step represents a deliberate response to governmental challenges. The process is structured and constrained by arcane rules that have become increasingly complex, especially during the last two decades. Fenno (1991, 135) suggests that the process may be thought of as a set of variable “governing rules,” under which substantial variations in procedures and sequencing are possible. McCaffery (1987, 373) depicts the process as “a resilient and flexible procedure able to accommodate changing conditions.” Describing the many developments in federal budgeting, including new budgetary procedures,

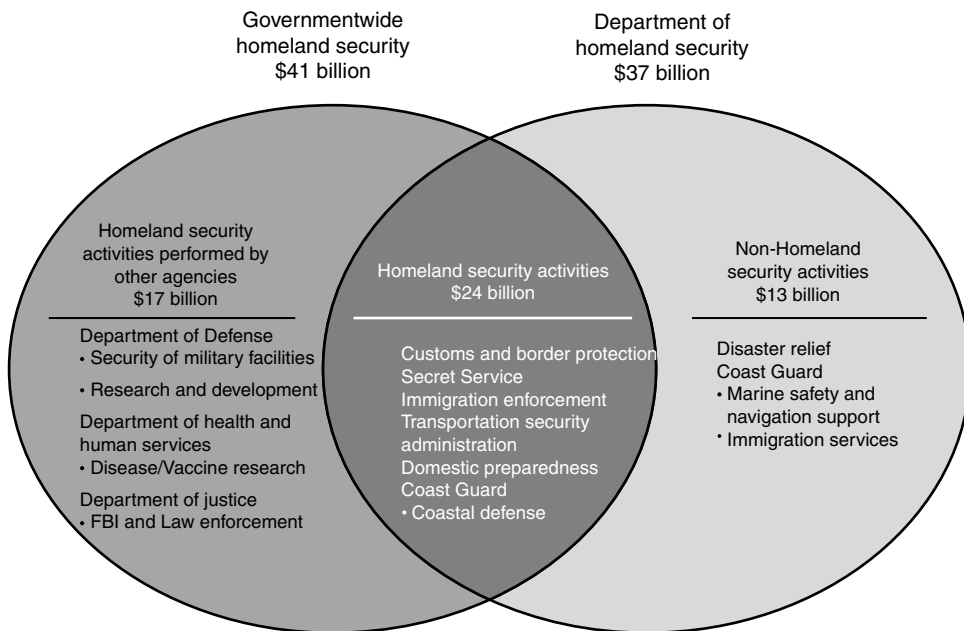

FIGURE 5.11 Funding Homeland Security, 2004. (From CBO, Federal Funding for Homeland Security, Economic and Budget Issue Brief, April 30, 2004. (<http://www.cbo.gov/showdoc.cfm?index=5414&sequence=0>.)

Schick (1995, 48) comments, “[T]he cumulative effect is to overload the process with more than it can handle in the time that is available.” OMB circular A-11 (1994) gives an overview of the current, formal process (see Figure 5.9).

Surely many concur with McCaffery (1987, 373), who points out that “history teaches us that techniques of budgeting are not as important as the purpose for which the money is spent.” White (1998, 165) argues that “[t]he budget process collapsed in the 1980s ...” and concludes that “pressures on budgeting will approach bursting, if the stakes of partisan battle are high enough” (White 1988, 194). That is what happened in 1990, when the government closed temporarily and the process again “reformed.” Several years later, in his budget message for fiscal 1995, President Clinton said, “We have ended drift and broken the gridlock of the past. A Congress and President are finally working together to confront our country’s problems.” Events again moved quickly, in a contrary direction. Discord and discontent over purposes and government’s proper role, coupled with institutional and partisan friction over policy and prerogatives, again led to a budget impasse in 1995 and the temporary shutdown of the US government.

The purpose of the federal budget process, laboring under paradoxical public attitude where by the public advocates specific programs but rejects the aggregate cost, evidently came to this: to oblige a feeding frenzy of pluralism, unfettered by the concept of public interest. Today, the process is both captive and creator of zero-sum realities and diminished play, and also victim of deliberate institutional fragmentation. It has been observed that “the federal budget is ... a sort of skeletal structure of our political system and public philosophy” (Franklin 1993, 9). In sum, a system designed for failure is succeeding.

J. CONCLUDING COMMENTS

Public opinion has judged government spending as wasteful and inefficient since 19768 (Ladd and Bowman 1998, 102–104 and National Election Studies, 2000, http://www.umich.edu/~nes/nesguide/toptable/tab5a_3.htm). The Pew Research Center (1998) reports that a majority of respondents agreed that “government is inefficient and wasteful”: 1990, 67%; 1992, 70%; 1994, 69%; and 1997, 64%. Testifying before a House subcommittee in 1996, US Comptroller General Charles Bowsher (1996, 2) said,

Today there is widespread frustration with the budget process. It is attacked as confusing, time-consuming, burdensome, and repetitive. In addition, the results are often disappointing to both participants and observers. Although frustration is nearly universal, there is less agreement on what specific changes would be appropriate. This is not surprising. It is in the budget debate that the government determines in which areas it will be involved and how it will exercise that involvement. Disagreement about the best process to reach such important decisions and how to allocate previous resources is to be expected.

Neither increasingly stringent professional standards nor advances in technology and technique appear to have altered public perceptions. Neither have they fundamentally addressed the underlying challenge of systemic change at increased transparency, comprehensibility, and responsiveness.

Public budgeting is adaptive, responding to social, economic, political, intellectual, and technological influences. It tends to adapt in small steps, apparently in slow motion, and generally by piling new rules, statutes, and institutions on top of the old.... The picture drawn is of a federal budgeting system that, to the uninitiated, is complex, cumbersome, convoluted, and perhaps even mysterious. Budget systems in many other large, complex jurisdictions also fit this description. Incomprehensibility and obscurity in this core decision-making process promote neither accountability nor trust in governmental institutions.

Trust and effectiveness speak directly to the role and function of budgeting in a democratic polity. Survey data show that trust in government is low compared to several decades ago; the average score on the National Election Studies' Trust in Government Index peaked at 61 in 1966, declined to 26 in 1994, rebounded somewhat to 32 in 1996, and reached 43 in 2002 (NES, http://www.umich.edu/~nes/nesguide/toptable/tab5a_5.htm). A broad gauge of the public's assessment of responsiveness, the National Election Studies' Government Responsiveness Index showed an average score of 57 in 2000, down from its high of 78 in 1966, but well above the 1982 low of 34 (NES, http://www.umich.edu/~nes/nesguide/toptable/tab5c_3.htm).

Public budgeting most likely will continue developing its multiple aspects, and in many directions. Perhaps its future will develop in tandem with other facets of public sector management; perhaps not. Surely theory will continue to draw attention from many in the discipline and professional practitioners will continue their refining best practices and techniques. What is unlikely to change is the heart and purpose of the matter: the allocation of scarce resources through democratic political processes. It is also unlikely that the future of public budgeting will be without new priorities to address and new challenges to confront.

I. INTRODUCTION

The discussion of broad-gauged budget theories that seek to describe the annual budget in public entities has been ongoing for nearly a century. These theories have met with mixed acceptance from both academics and practitioners. Scholars from a number of disciplines (public administration, political science, and economics among others) have sought to explain the enormously complex budgetary process via a relatively small number of propositions—some testable, some not—that

provide budgetary actors and scholars with an analytic framework for their actions. The question of whether or not these theories have value to practitioners or whether they serve as “tenure producing capital” (Neuby 1997, 139) for academics lies in the background in the study of budget theory. Budgeting may be too complex for any one set of theoretical propositions to explain. But an era of cutback management and enhanced interest in government performance suggest that as a new millennium begins, the search for tools that enhance the rationality of government expenditures—or justification for reducing government—will keep the search for a budget theory alive and well. A cautionary note is offered at the onset. Budget theory at the start of the new century is considerably different from that espoused during much of the last half of the previous century. Grand schemes of budgetary optimization put forward by economists and a wide range of budgetary formats such as zero-based budgeting, planning programming, and budgeting have gone by the wayside. In their place is a broadly defined theory in performance management and measurement that is intended to foster greater effectiveness in program delivery. Old budget theory might have suggested to a city manager that there was an optimal level of recreation services, road repair, and policing in a particular jurisdiction. The new budget theory would focus on whether the current levels of recreation, road repair, and policing in the city are consistent with mission, customer (i.e., citizen) expectations, and cost and quality in peer jurisdictions. Equally important, city managers (and the elected representatives under whom they serve) might ask if such services should be delivered by the public sector or by some alternative providers. In essence, the new theories of budgeting at the onset of the new millennium have a different fit and feel from their predecessors, and as will be seen below, have not yet been systematically articulated. And if there is a message from both academic and practitioner ranks, budget theory in our epoch is the theory of agency performance—how it is measured and enhanced over time. The first part of this chapter reviews what might be termed the classic or traditional budgetary theories that dominated discussion in this realm from the immediate post-World War II era to the 1990s. In part two, the various strains of thought associated with what might be termed the Performance Measurement Revolution and related topics such as benchmarking and re-engineering are explored. These approaches are contrasted and compared to see how and in what ways they overlap or differ from their predecessors. Perhaps more importantly, questions are raised regarding the study of performance measurement and its relation to methodological shortcomings inherent in public administration as a discipline. Lastly, some alternative approaches to the study of public budgeting are explored that might prove valuable to both practitioners and academics.

II. CLASSIC BUDGETING THEORIES

A. INCREMENTALISM

Incrementalism might be considered the grandparent of budget theory. As has been noted elsewhere (Frank 1998), many public administration students and scholars can peg their matriculation in public affairs programs to the *Politics of the Budgeting Process* (Wildavsky 1964) or one of its succeeding editions, a work thought to be the exemplar of incrementalist thinking. Indeed, for many, budget theory, incrementalism, and Aaron Wildavsky are nearly synonymous.

What are incrementalism’s major tenets? Taking a cue from the work of Lindblom (1980), Wildavsky and his colleagues (Davis, Dempster and Wildavsky 1971) contended the following:

1. Time and cognitive constraints preclude a rational assessment of the benefits and costs of all but a handful of budgetary and policy alternatives; decision makers are forced to utilize a handful of simple budgetary rules to address the political and technical complexity of the budgetary process.

2. With point one in mind, decision makers are likely to anoint a budgetary base or locus of programs that remain essentially untouched in the annual budget process; changes to this base are likely to be small or incremental in size.
3. During hard financial times, rules of fairness will dictate across-the-board budget cuts rather than careful prioritization; these budget cuts might lead to wholesale elimination of some programs as a means of preserving or enhancing others.
4. Line-item budgeting will be a preferred format. Rational budget types such as program budgeting, zero-based budgeting, or management by objectives, introduce too much political conflict by clearly specifying intended program outcomes. Equally important, the bureaucracy is generally ill-equipped to implement these intelligent forms of budgets, which elected officials fail to understand in the first place (Pilegge 1989).

The inescapable conclusion of incremental thought is that budgeting is essentially a sub-optimization effort in which the typical agency accepts a small increment (perhaps as little as 3%) in any given budget year. This increment is more likely than not the outcome of a gaming process in which the agency requests an amount in excess of what is expected with the knowledge that the amount requested will be reduced by the budget office or by some other actors. But this cooling out process will result in a budget that remains more or less static over time. The incremental mindset connotes a downplaying, if not derision, of rational analytic techniques such as benefit-cost analysis or program evaluation. From the incrementalist perspective, many view these as pseudo-scientific accoutrements of think-tankers rather than as the essential tools of budgetary trench warfare in which program reputation and lobbying strength are primary determinants of budgetary outcomes.

In retrospect, it is easy to understand the reasons how and why incrementalism was a victim of the zeitgeist from which it was born. Davis, Dempster, and Wildavsky (1971) operationalized and empirically tested their incremental model with data drawn from the middle and late 1950s through the early 1960s. This was an American era of good feeling (Halberstam 1994), when Americans' real wages were increasing and social issues such as race and crime were relatively moot. Against this backdrop, a theory of budgeting based on essentially inviolate budget bases and limited political conflict made eminent sense.

This era of social tranquility and economic growth coupled with low inflation came to a painful end in the 1970s when America was confronted with a previously unheard of combination of economic stagnation and high inflation known as stagflation (Eisner 1995; Thurow 1980). As Americans' real earnings shrank, their anti-tax sentiments grew (Kirlin 1982). The incrementalist mindset of a stable budgetary base came to an abrupt end in an era typified by increased political conflict and decreased financial resources: budget cuts as well as specific legislation, such as California's Proposition 13 which was passed in 1978, limited government's ability to raise revenue or increase expenditures even in the best of economic circumstances.

It was at this time that a number of scholars (Gist 1977; LeLoup 1988; Rubin 1990) began to question the value of incremental thinking. One aspect of the critique was normative. Is incrementalism prescriptive or descriptive? Another was technical. Empirical investigation of budgets at the department or divisional level may appear stable; however, closer examination at the departmental or program level might reveal a far greater level of instability and change. Still another technical question concerned the role of inflation: a small budgetary cut or increment may be augmented or eliminated when inflation is factored into the model. Consecutive cuts or increments in the context of price instability may add to significant cuts or may create a virtual standstill in real dollars, a fact that was neglected in much of the empirical work undertaken in support of the theory.

The advent of the Reagan era, with its widespread dismantling of domestic social programs (Stockman 1987), laid to rest the widespread belief in an incremental world whose foundation was a permanent budget base. At the local level, near-bankruptcies and wholesale reengineering efforts that resulted in significant reductions in force engendered a mindset that could not be typified as

decrementalism. Instead, it was an era in which governments at all levels had to do more with less or had to make intelligent decisions about what functions to eliminate (Caroley 1982; Ukeles 1982). In *The New Politics of the Budgetary Cut*, Wildavsky and Caiden (1997) acknowledge that the incremental world of the early 1960s with stable budgets and ideological consensus was replaced with a much more fluid budgetary environment where the annual budget process was a principal ideological battleground.

Despite the change in environment, incrementalist budget theory cannot be dismissed altogether. First, a closer examination of Davis, Dempster, and Wildavsky's (1971) work indicates that while year-to-year changes were very highly correlated, those comparisons showed considerable variation two or more years out. In essence, the budgetary base may have never been as inviolate as some of incrementalism's critics assert. Second, legal obligations, union contracts, program commitments, and politics suggest that a budget process for year X cannot ignore year $X-1$. Year-to-year uncontrollability is an ever-present reality; the past simply cannot be denied. And lastly, the incrementalist skepticism regarding rational analytic tools—including the current emphasis on performance budgeting—has a rightful place in the intellectual quiver used to understand budget process and outcome.

B. ECONOMIC-BASED MODELS

As noted at the outset, economics has been the keystone in budgeting theory. This is to be expected given that budgeting ultimately deals with the allocation of scarce resources, and the *raison d'être* of economics is how to answer the questions concerning resource allocation. The economic approaches that have dominated budgetary thinking are embedded in diametrically opposite views of government's potential as a service provider. Notwithstanding this difference, economic thinking lies at the core of classic and contemporary budget theory.

1. Models of Optimization: Budgeting at the Pigovian Margins

Assume for a moment that you are a city commissioner or city manager deliberating on the coming fiscal year's budget. Should you, for example, put incremental dollars into police or recreation? If you say the former, should the money be spent on enhanced street patrols or new data-sharing computers? If the latter, should it be for more midget league football or more day care? Presumably, these choices are not all-or-nothing in nature: street patrols would not be eliminated to enhance computing; midget league football would not be eliminated altogether to enhance day care; nor would the opposite be the case. The question would be decided at the margin with economic tools related to estimation of benefits and costs making the allocation simpler. The end result is an optimal allocation in which the marginal benefits and costs of a number of programs would be maximized at levels which maximize social welfare. This optimization is normally associated with welfare economics and the work of Musgrave (1980) and Pigou (1947).

This mindset may seem strange, indeed almost religious, to readers who have come of age in an era of governmental restraint and frequent doubt about government's ability to deliver what it promises. But as Howard McCurdy (1986) notes, the early 1960s marked a heyday for governmental intervention in the economy, and the applied microeconomic theories (as well as macroeconomic theories of full employment) were driven by optimization of government output based on marginal analysis.

The Pigovian perspective laid the groundwork for two major theories in budgeting: planning, programming, and budgeting systems (PPBS) and zero-based budgeting (ZBB). PPBS was an outgrowth of Rand Corporation thinktanking, an outgrowth that was applied to the allocation of resources for the American armed forces during World War II. Its introduction into the federal budget in the Defense Department in the 1960s was spearheaded by Robert McNamara and other whiz kids (1990) who were responsible for Cold War defense policies—most notably for the

creation of credible nuclear deterrents and at the same time for the maintenance of non-nuclear capabilities in potential theatres of operation around the world. While not as deeply rooted in applied microeconomics as PPBS and undertaken from a bottoms up perspective, ZBB is also rooted in the assumption that rational analysis at the margin can deliver answers to V.O. Key's "\$64.00 question on the expenditure side of public budgeting.... On what basis shall it be decided to allocate X dollars to Activity A instead allocating them to Activity B, or instead of allowing the taxpayer to use the money for his individual purposes?" (1148). In PPBS, this question is answered in the language of benefit-cost analysis and program evaluation; in ZBB, decision packages sent through the bureaucratic channels lead to senior executives and elective officials divining appropriate mixes and levels of public good and service delivery (Lewis 1952, 43). The success of PPBS and ZBB was short-lived in the hands of the federal government, and their imitators at the state level did not fare much better (Lynch 1995). Nonetheless, as ideal types in a Weberian sense, these budget formats represent the belief that rationality rather than politics can triumph in governmental resource allocation. As naive as this may appear, it is a powerful vision that has survived in a number of forms: program evaluation, performance measurement, and results-oriented governance. For better or worse, budgeting is political as well as technical. But if technocracy, though presaged by Pigovian thinking, was not altogether successful, elements of it remain in contemporary practice.

2. Public Choice

The rationality that informs the welfare economics and general equilibrium-driven models such as PPBS and ZBB also breathes life into another economic approach to budgeting. In this case, however, it takes up a political perspective at the opposite end of the spectrum from the 1960s-style optimization. Public choice adherents hold rationality of behavior and constrained choice in the same high esteem as their more politically liberal colleagues, but there the similarity ends. Adherents of the New Political Economy see government as a poor service provider at best, a threat to individual freedom at worst, and a meddler in a market system that needs little public intervention (Buchanan and Musgrave 1999) to function appropriately.

At the core of the public choice belief system is a fundamental mistrust of bureaucracy and its connection with elected officials. It can be sketched in the following interrelated propositions (Buchanan and Tullock 1962; Niskanen 1971; Ostrom 1989; Wagner 1983):

- The bureaucrat has critical knowledge of governmental operations that a cadre of predominantly part-time elected officials lack; this information asymmetry allows government agencies to overproduce public goods at wasteful prices.
- Elected officials' incentive structures make re-election paramount; this is the impetus for bureaucratic overcharging and oversupply through a bias towards increased size of the public sector.
- Operating out of self-interest, bureaucrats are predominantly members of the liberal parties of major democracies; hence political influence, particularly at the local level, can add to the oversupply of government with strong government unionization enhancing this accretion.
- Representative democracy is a messy means of translating collective desires into optimal levels of government service provision; the absence of referenda and direct forms of balloting for specific goods and services leads to an oversupply of government.
- Fiscal illusion allows current voters to consume in the present via the issuance of debt which will be paid for by future voter-consumers; these consumers will be represented by an ostensibly different generation of elected officials. This seemingly painless consumption in the present leads to over-expansion of the public service.

- Decentralized governance structures and multiple, competing jurisdictions allow voter-consumers to choose between jurisdictions that provide them with the best mix of goods and services for a given tax price; inefficient or oversupply jurisdictions will lose residents or businesses. Voting with their feet (the so-called Tiebout hypothesis) places a check on bureaucratic growth and oversupply of government services.
- A necessary check on the growth of government and the bureaucratic-elected official nexus is discernible in the constitutional limitation on revenue and expenditure. These tax and expenditure limitations (Advisory Commission on Intergovernmental Relations 1995) are, from the public choice perspective, the most effective means of thwarting the growth of government.

One could argue that public choice is not so much a budget theory as it is a theory of the bureaucracy or a theory of government in general. This line of reasoning is valid but nonetheless misses the point. The fact of the matter is that the public choice perspective of government and bureaucracy is probably the dominant mindset of governance over the past quarter century. As Rosenbaum and Gajdosova (2003) note, the growth of government and its capacity to effectively deliver public goods and services are front-burner issues in both the developed and less-developed nations. Recent efforts by the bureaucracy to shed its image as an inept oversupplier of public goods, efforts echoed in the many attempts to rebrand it re-engineering, comparative performance measurement, and customer-oriented governance, must be seen as direct reactions to the challenges that public choice has made to mainstream public administration and the Weberian bureaucratic model upon which it rests.

It matters little that many of public choice's tenets fail to hold up under careful empirical scrutiny. Service delivery in smaller, competing jurisdictions is not always perceived to be better than in larger, consolidated ones (Lyons and Lowery 1989). Movement of people and businesses between communities is not as frictionless as public choice adherents suggest (Raimondo 1992), and high tax jurisdictions that offer commensurately high quality of life may attract people and businesses (Bartik 1991; Savigeau 2000). Unfortunately, stagnation of real earnings since the oil shocks of the seventies has placed government at a relative disadvantage—people are unwilling to contribute to collective consumption when keeping roofs over their own heads becomes more difficult (Peterson 1994). This stagnation, coupled with what Aaron Wildavsky (1988, 753) terms the “ubiquitous anomie” of the American bureaucracy (i.e., the fundamental mistrust that Americans feel about government), suggests that from an operational perspective, government will be under constant pressure to deliver more with less and to prove that its services meet the needs of its customer taxpayers. This has created a double-barreled impetus to provision by private or non-profit providers (Osborne and Plastrik 2000). Within this context, public choice must be seen as a driving, if not dominant, budget theory as the new millennium is entered.

Incrementalism and both the liberal and conservative branches of economics applied to budgeting represent intellectual bookends along a continuum of thinking that can be seen in practice. Lynch (1995) correctly asserts that those who create and utilize budget theories must adopt a catholic view of major budgetary schemes if they are to be effective practitioners. History cannot be ignored; hence incrementalism will always have at least some validity in explaining budget behavior. Contrariwise, the fact that many federal, state, and local agencies have research, planning, and development division, suggests that the notion of getting the biggest bang for your buck with its associated benefit-cost mindset carries on even if PPBS is essentially dead. A strong reaction to the public choice critique of mainstream public administration is the driving force for much of the contemporary reengineering movement. The upshot is that incrementalist and economic approaches to budgeting provide much of the intellectual underpinning for the study of public budgeting despite the controversies surrounding their explanatory power and normative assumptions.

C. THE PERFORMANCE MEASUREMENT AND BUDGETING PARADIGM: BUDGETING THEORY AND INTELLIGENT SUBOPTIMIZATION OF PUBLIC BUDGETING IN THE NEW MILLENIUM

The sheer volume of writing in the performance measurement arena (Frank and D'Souza 2004) suggests that a new era in the arena of public budgeting has arrived. Lawrence Martin (2002) contends that the heightened emphasis on performance and outcome-related budgeting and management represents a break with the past in the study of budget theory. The intellectual warfare between incrementalists and non-incrementalists has been supplanted with the following question: Can governments begin to assess their provision of goods and services in a manner analogous to that of private entities (Kelly 2002)? The publication of *Service Efforts and Accomplishments Reporting: Its Time Has Come* (Hatry et al. 1990) by the Governmental Accounting Standards Board of the Financial Accounting Foundation will probably be remembered as a seminal event in budget theory history. This work established the need for state and local governments to systematically report on the quantity and effectiveness of their service delivery. Its publication was roughly contemporaneous with similar efforts made by the Government Performance and Results Act at the federal level as well as those by other organizations (e.g., the University of North Carolina-Chapel Hill, the International City and County Managers Association) devoted to systematic interjurisdictional comparison of performance. Osborne and Gaebler's *Reinventing Government: How the Entrepreneurial Spirit Is Transforming the Public Sector* (1993) and, more broadly, the movement towards more responsive, customer-oriented public service delivery are also a product of the early 1990s. Service effort and accomplishment reporting are an integral part of the reengineering model. In sum, Hatry et al.'s (1990) opus represents an exemplar (Ritzer 1975) in an emerging public productivity paradigm; as such it may very well dominate the study of contemporary budgeting.

Much of the public performance movement focuses on whether organizations are doing the thing right. Such an approach is in opposition to the aforementioned economic approaches to budgeting that were focused on answering whether or not governments were doing the right thing. This is unsurprising. In McLean's (1987) view, most public organizations are confronted with questions that deal with x efficiency related to execution of policies rather than y efficiency related to macro policy choices. Twenty-five years of cutback management and reengineering efforts have led to a public sector with wage gains and salary fringes on par with private sector standards. Since 1993, public sector job growth outside of education and criminal justice has been around 8%. By contrast, the private sector has seen a 19% gain (Mandel 2003, 16). On the other hand, to the extent that they can be measured, productivity gains in the public sector lag behind those of the private sector. This suggests that while the public sector does not suffer from the bloat imputed to it by public choice economists, its underlying processes and organizational design are problematic (National Commission on the Public Service 2002).

Public management scholars have long maintained the need for performance measurement and accountability in the administration of public programs (Murphy and Carnevale 2001, 2002). The last twenty years of research and implementation in the performance measurement (PM) arena is pregnant with the promise of improved practice. Reflecting a private sector mindset (Kelly 2002), PM implementation has brought systematic assessment of cost, quality, and citizen satisfaction to a number of venues in the United States at all levels of government as well as throughout government in Canada, Australia, New Zealand, and Western Europe (Dluhy et al. 2000).

The diffusion of PM utilization has many roots (Halachmi 2002) from economics and the public sphere to government, telecommunications, and beyond. The need to do more with less has spurred interest in ascertaining the value of taxpayer return on investment. A better educated public demands more information on how its money is spent. The legislative branch wants to enhance its relevance and credibility while in office, both of which are

made more difficult with the increasing prevalence of term limits. The increased use of advanced telecommunications and information technology has put the once novel processes of benchmarking and cross-jurisdictional comparisons within the grasp of many practitioners. Training in PM and budgeting is becoming a staple of Master of Public Administration (MPA) curriculums (Frank 2002; Rivenbark 2001). Survey results suggest that in many jurisdictions, PM plays an important role in identifying funding alternatives and establishing service funding levels (Gianakis and Wang 1999).

Simply put, the tenets of Hatry et al. (1990) and those of Osborne and Gaebler (1993) appear to be flourishing throughout the public sector, here and abroad. The provision of systematic performance measurement—an integral part of the Reinventing Government movement that focuses on results-oriented public management—is here to stay. The movement and its tenets have been institutionalized in the federal government via the Government Performance and Results Act (GPRA) of 1993, which has been emulated by other governments (Ogata and Goodkey 2002) and sponsored by respected professional associations like the American Society for Public Administration, the Government Finance Officers Association, and Governmental Accounting Standards Board (Dluhy et al. 2000).

On the face of things, the utilization of PM has deep roots and strong support. But upon closer examination of its implementation, a picture emerges that many describe as bimodal in a number of ways. At the municipal level, half the nation's jurisdictions still deploy the line-item budget (Gianakis and Wang 1999; O'Toole and Stipak 2002). Local governments that have deployed PM have tended to focus on widget counting and workload measures with little done to measure efficiency and effectiveness. Virtually identical findings have been noted at the county level (Berman and Wang 2000). At the state level, Melkers and Willoughby (1998) note that 47 of the 50 states surveyed employed what they termed performance-based budgeting. But none had clear penalties or rewards for substandard or above-standard performance and, in a topic that will be returned to shortly, allocation decisions and linkages with larger strategic issues appeared tenuous. Grizzle's (1999) findings reinforce those of Melkers and Willoughby. She found that after nearly a decade of program budgeting in Florida, there was a substantial difference between agencies and their respective legislative oversight committees in terms of implementation: most remained wedded to traditional line-items and budgetary control, and a small handful utilized performance data for tie-in with agency-wide budget allocation and individual performance appraisal. Nearly a decade after the GPRA (Hatry 2002), this bifurcated pattern has finally been noted in many federal agencies.

The possibility that the rhetoric of PM has outstripped the reality of implementation (O'Toole and Stipak 2002) is not surprising to at least some observers. The line-item budget is a very hardy perennial (Pilegge 1989) that is simply produced and easily understood. Furthermore, it readily facilitates the most elementary of budget functions control. Ammons (1999, 2002) and Behn (2002) note that many jurisdictions do not have an organizational culture that fosters critical assessment of service cost and quality. The widespread perception in the public sector is that good performance goes unheralded, while substandard effort, to speak in mafia jargon, gets whacked. The authors' experience in applied work and technical assistance in two large urban counties in Florida suggests that public managers may support PM as a generic concept but remain highly skeptical about implementation in their respective communities. While a sense of professional best practice leads them to embrace PM, managers' past experience with prior budget reforms and management tools (e.g., ZBB, quality circles, MBO) fosters a sense of *déjà vu*. In short, a strong veneer of support for PM implementation masks deep misgivings about its staying power and ultimate value to practice.

This dual mindset may be a function of unsubstantiated claims made by PM adherents. No doubt research of PM has been unsystematic. Practitioners have been surprisingly lax in evaluating PM implementation (Andrews 2002), generally failing to specify clear-cut goals, outcomes, and expectations of the institution of formal PM. Academics have aided and abetted this by failing to

address critical normative issues regarding PM implementation. Even worse, academic treatment has been methodologically inappropriate. A plethora of survey-based work provides the backbone of public administration's PM knowledge base. It is unlikely that these surveys will provide satisfactory answers to implementation issues in PM. Valid social science research, be it qualitative or quantitative, should align research purpose with the appropriate method (Ritzer 1975). To my mind, PM implementation and its research coverage have been poorly matched. The study of PM, as is the case any subject, should address fundamental, intertwined questions within the context of appropriate methods. In the social and managerial sciences, research substance, method, and paradigm are inextricably interconnected (Burrell and Morgan 1979; Ritzer 1975). PM in the public sector is currently pre-paradigmatic (which is to say, ill-defined in terms of means, ends, and analytic framework) and the predominance of one-shot case studies and surveys pertaining to this subject matter are both cause and effect of the pre-paradigmatic status.

As Andrews (2002) notes, academics strongly support program evaluation. Yet most PM implementation fails to specify organizational expectations regarding its roll-out. There appears to be a groundswell of support for PM, but its would-be implementers have only a vague idea of what they expect from it. From a workaday vantage point, a basic tenet of operations management is that the benefits of obtaining information should at least equal the costs of obtaining it (McKenna 1980). As will be shown below, there appears to be very little hard evidence that the expensive and time-consuming process of developing and utilizing PM really pays off in tangible or intangible benefits to public organizations and the citizens they serve. A likely prerequisite of achieving paradigmatic status in PM research will be the focus on a handful of big questions regarding, among other things, intended audience and the standards for good measures. For example, do they need an external referent such as professional standards or benchmarks with peer organizations (Frank 2002; Harris 1995)? Without widespread agreement on the critical means and ends of PM, implementation research may be circular at best, misleading and contradictory at worst. Indeed, failing to address PM implementation in a systematic manner without a minimal benefit-cost analysis of both pecuniary and non-pecuniary aspects could be construed as a moral breach in the study of public budgeting (Lewis 1992). Why is that the case? Failing to provide a preliminary benefit-cost assessment of PM implementation would only reinforce a belief held by many practitioners that PM is a feel-good exercise done to assuage an angry public's anti-government sentiment (Glaser and Denhardt 2000; Shelton and Albee 2000), rather than a *modus operandi* designed to address the strengths and weaknesses of public management. Seen in this light, honest efforts at assessing the benefits and costs of PM square with a basic tenet of organizational design and intervention called for by Swanson (1994), who notes that significant organization investment (e.g., new computers, enhanced training, expanded facilities) require careful analysis of costs and consequences.

One could argue that defining best or even effective practice in the PM arena may be premature. The Governmental Accounting Standards Board (GASB) published *Service Efforts and Accomplishments Reporting* in 1990. Perhaps more time is needed before researchers and practitioners alike adhere to an agreed upon set of expectations for PM implementation. Moreover, some might dismiss a benefit-cost framework out of hand as being too cumbersome to implement, particularly in light of the fact that very few governments have the capacity to apply activity-based costing to their activities. Nonetheless, as Robert Behn (2002) notes, it is important to begin separating the hype from the reality in the PM realm. At present, PM is portrayed as a worthwhile endeavor, but there is increasing evidence that the reality of implementation is nowhere near what many expect of how it will perform in practice. Many public organizations are simply not ready to undertake serious PM (Ammons 1999, 2002; Berman and Wang 2000) in terms of organizational climate, personnel, or information technology infrastructure. If research in the PM realm is intended to inform practice, it needs to account for these shortcomings and to help organizations develop their PM capacity.

Improving organizational capacity to implement PM is likely to require two things. First, it suggests that researchers in the PM realm need to answer some fundamental normative questions about good PM practice. Second, it requires a wholesale change in what constitutes admissible evidence in PM research. Granted, achieving these ends will not be easy. As noted earlier, research in PM has not focused on a set of big questions which might allow for accumulation of knowledge. More importantly, multi-jurisdictional, longitudinal research has been the exception rather than the norm in public administration (Forrester 1997). Without such research, it may be difficult to answer some of the more critical issues facing PM implementation. These limitations notwithstanding, it may be appropriate to examine some potential big questions and methodological expectations that might contribute to the making of a PM implementation paradigm.

1. Do Real Performance Measures Require an External Referent or Standard to Be Valid?

Assume for a moment that a fire battalion chief informs her superiors that over the past two years, average response time at her station for the most critical calls has trended down from nine minutes to seven. *Prima facie*, a 22.2% reduction in response time might sound impressive. But what if other stations in the same city averaged five and one-half minutes? And what if national standards suggested that when life is at stake, emergency response should be under five minutes? In light of these comparisons, does the 22.2% reduction sound all that impressive?

Elaine Morley, Scott Bryant, and Harry Hatry (2001) follow this line of reasoning. It is evident in their assertion that legitimate performance measures must be developed with comparisons to professional standards, peer organizations, other communities, or sister organizations occupying different geographical or organizational space (e.g., different schools in the same district, different regions of a state department of transportation). Simply put, without an external referent, public agencies will develop self-justifying, easily attained standards that may mask objectively subpar performance.

The logic behind their assertion is difficult to refute. Theoretically, private entities are obligated to compete; hence, their PM is automatically driven by market forces. Public entities may implicitly compete with neighboring jurisdictions (Raimondo 1992), but such competition takes place in the context of a bundle of public goods and services sold at a tax price. It is not likely, however, to impact public production costs as directly or immediately as a market model. Further, it is widely believed that if left to their repose, most public managers will set easily achieved benchmarks for success. The belief that performance standards will be used asymmetrically (i.e., as a means of punishment rather than a mechanism for reward; Ammons 1999; Osborne and Plastrik 2000) appears to be particularly true in the context of external benchmarks. This anxiety over the need for an external standard is frequently dismissed by those who assert that every jurisdiction is unique and therefore unripe for what Morley, Bryant, and Hatry (2001) term “comparative performance measurement.” With this fear handily repressed, it is unsurprising that very few public entities engage in cross-jurisdictional comparison (Berman and Wang 2000) or belong to PM consortiums such as those sponsored by the University of North Carolina or International City/County Management Association (Coe 1999).

In reply, one might argue that for many communities it would be a sea change to move beyond an item-of-expenditure budget. Many in the public service are still unsure about the difference between inputs, outputs, and outcomes; this is particularly the case with the latter (Frank 2002). Thus, the development of in-house measures without external referent may be a bridge to more advanced measures that would account for outside benchmarks (Ammons 1999). Unfortunately, our lack of longitudinal research in the PM realm makes it impossible to speculate if the crawl before you can walk progression to PM implementation ever takes place. Regardless, what Morley and colleagues have suggested amounts to a more scientific approach to PM development. Their model effectively requires PM designers to research and import

extant measures in particular service delivery areas. It also lends itself to systematic comparison with peer organizations.

Morley, Bryant, and Hatry (2001) have thrown down an important intellectual gauntlet that effectively tiers PM implementation. In-house PM measures are lower tier; benchmarked measures are higher. Morley and Hatry are long-time researchers in the PM arena—arguably two of its earliest and strongest promoters. Their call for externally referenced performance measures cannot be easily dismissed. This is because Morley, Bryant, and Hatry call into question much of what many practitioners would deem performance measures.

2. Is It Realistic to Expect PM Systems to Be Integrated with Strategic Planning Efforts, Individual Performance Appraisals, and Budgetary Resource Allocation?

In the best of all possible worlds, PM utilization should be connected to strategic planning, individual performance appraisal, and budgetary resource allocation (Bowsher 1985; Osborne and Plastrik 2000). Performance measures at the operational level would be aligned with broader strategic aims. These, in turn, would be linked to inducements and rewards at the individual level. In theory, superior organizational (and individual) performance should be rewarded with enhanced budgetary resources; less than satisfactory performance would be punished. This alignment of broad social aims, organizational goals, and individual-level performance appraisals is consistent with a reinventing government model in which the legislative branch focuses on policy outcomes as opposed to organizational inputs (Osborne and Gaebler 1992; Osborne and Plastrik 2000)

Evidence suggests that the marriage of PM, strategic planning, individual performance appraisal, and resource allocation is seldom consummated (Behn 2002; de Julnes and Holzer 2001). Some observers (Grizzle 1999; Melkers and Willoughby 1998) have noted this absence and the serious questions it raises regarding the true intent of PM utilization. If PM is not a linchpin for these critical functions, what then is it good for? This line of questioning is bolstered by the fact that most PM are output- as opposed to outcome-oriented (Gianakis and Wang 1999; Mikesell 1999) and offer limited information regarding program cost-effectiveness. The absence of alignment coupled with PM's limited use as an allocation tool suggests to at least some observers that PM is at best a tool for justifying the budgetary status quo and at worst a set of numbers published by governments to placate an angry, tax-averse public (Shelton and Albee 2000). Under this scenario, implementing PM can be deligitimated as oversold and, worse still, as that which increases the very public cynicism that it is ostensibly intended to reduce.

That PM has again and again been found to be linked to what might be termed higher level organizational functions raises the real possibility that PM study and implementation may be negatively impacted by a number of longstanding dysfunctions in public management. For example, are public personnel systems so slow in hiring and disciplinary actions (Lewis and Frank 2002; Ukeles 1982) that linkages to PM may be entirely unrealistic? And do limitations to strategic planning in the public sector (e.g., frequent turnover of senior managers, limited legal or administrative ability to lock-in strategic changes) crimp potential links with PM? Simply defining good performance might be a huge step in many public organizations. Linking this operationalization to other facets of the organization and ultimately tying PM to resource allocation may be beyond the capacity of many public organizations. Is the normative assumption that PM should be aligned with strategic aims and individual performance appraisals realistic? Is the linkage needed to improve service quality or reduce cost? Evidence from the performance consortium at the University of North Carolina's Institute of Government suggests that such linkages are the second or even the third things on the minds of many participants: obtaining useful information on service delivery expectations and unit costs is primary (W. Rivenbark, personal communications, 2000). Linking PM to broader strategic aims and individual appraisal may not be as necessary as some PM researchers seem to believe.

3. Who Is the Principal Beneficiary of PM Development—The Public, the Bureaucracy, or Elected Officials?

The easy and perhaps overly simplistic answer would be to reply: “all of the above.” In terms of ultimate beneficiaries, this is probably the case. But in terms of PM implementation, delineating a primary beneficiary may be a significant step forward.

The presence of a “troublesome cleft” (Whicker, Strickland, and Olfshski 1993, 531) between political science and public administration is clearly evident in our unwillingness or inability to satisfactorily address this question. Research since the seminal *The American Voter* (Campbell et al. 1980) has led to the development of a critical analytic framework; this research suggests that few Americans would have the time, inclination, or cognitive capacity to understand a PM system with detailed inputs, outputs, and outcomes. It may be one thing to tell parents that their children’s elementary school rates a B on a statewide, standardized test. It is still another to engage them with detailed cost and performance data on local garbage collection or waste water treatment. Indeed, as Coplin, Merget, and Bourdeaux (2002) make clear with respect to the Community Benchmark Program at Syracuse University, “In our experience, we have found the term ‘benchmarking’ is mentioned in discussions by citizens and government officials. In contrast, we have yet to find an editorial or public statement by a government official that uses the phrase ‘government-performance’ measure” (708). As these authors note, the public and elected officials find it difficult to deal with what might be termed the minutiae of performance time series or cross-sectional comparisons. In light of our knowledge regarding the American public and its relatively limited cognition of the political scene, this finding is anything but surprising.

This line of reasoning has two important corollaries. First, it speaks to the oft-noted frustration among elected and senior administrative staff regarding the public’s disinterest in PM development and reporting (Gianakis and Wang 1999). However, rather than being frustrated, perhaps would-be PM implementers should adopt the stance of North Carolina–Chapel Hill Institute of Government staff (W. Rivenbark, personal communication, 2000) who assert that a PM system which obviates tax or fee increases, reduces citizen complaints, or maintains superior bond ratings is effective; these actions speak louder than any detailed public reporting. Second, a private-sector analog to government performance reporting that includes detailed quarterly or annual reports may constitute an unnecessary administrative and cost burden. An annual performance report on a handful of key aggregate measures (e.g., bond rating, tax burden, service quality assessment) is probably more than sufficient; under these measures, the citizenry would be adequately informed about government performance. Even though Internet posting or dissemination of such information may lower distribution costs, neither can change the fact that a detailed breakdown of service effort by function, with interjurisdictional comparisons, may be too much for the average citizen to comprehend. In a word, it may be time to acknowledge that developing and reporting of PM may be the province of the technocracy; citizens and their elected officials may benefit from spillovers emanating from a relatively cloistered existence. Determining the appropriate primary audience for PM goes hand-in-hand with the concern about cost-effectiveness noted above. As Rivenbark and Kelly (2000) note, PM development and reporting are an expensive undertaking. Well-intended efforts that waste time, money, and effort on measures that are too complex for cognitively challenged recipients will do little to increase the public’s faith in government. Indeed, circulating overly complex PM material to the public could simply incur anger because it may appear exceptionally wasteful or unnecessarily obfuscating.

In the final analysis, PM may assist communities with strategic goal setting or citizen outreach, but it cannot be a substitute for sound planning or effective communications to citizens. Effective PM may or may not contribute to best practice in human resource management. But it is unlikely to make the public sector more attractive to potential applicants (arguably the central issue in public human resources management) or make it easier to discipline or remove unsatisfactory employees. This is particularly true if managers are unwilling to undertake the arduous path needed for such

action. In short, without some intellectual boundaries, PM potential may be oversold with unrealistic expectations. Hence, addressing fundamental normative questions such as those raised here has real world implications for PM implementation.

III. BUILDING A PM PARADIGM: MATCHING APPROPRIATE METHODOLOGY TO PM IMPLEMENTATION DESIGN QUESTIONS

Developing a paradigm within the social sciences generally implies linking an agreed upon base of knowledge with research methods necessary for building upon that base (Ritzer 1975). In economics and anthropology, for example, there is general agreement about both the knowledge base and the tools used for its expansion. Yet in political science or sociology, there tends to be a rift between disciplinary scope and research methods. As noted earlier, the “performance measurement revolution” only began a few years ago. Hence, it may be too soon to expect a clear preference of method and substance for research in the PM realm. As a result, it may be appropriate to typify PM development as pre- or multi-paradigmatic (Frank 2002).

Notwithstanding the relative newness of PM implementation research, competent practice in social science dictates that researchers match appropriate methodology to the question at hand (Judd, Smith, and Kidder 1991). Unfortunately, as Robert Stallings (1986) observed in his critique of PhD programs in public administration, research in the discipline often suffers from a serious method–substance mismatch. In addition, Thompson et al. (1998) asserted that the discipline’s absence of extramural funding led to serious methodological and substantive shortcomings. Public administration’s chronic research shortcomings are clearly evident in the PM realm, limiting our ability to answer implementation research questions.

Generally, there have been only two types of research in PM: one-jurisdiction case studies or fixed-response mail surveys. The deployment of one-jurisdiction case studies is typical of the discipline (Forrester 1997) and reflects a research ethos and lack of extramural funding that fail to sustain multi-site, longitudinal findings. The ubiquitous surveys are more surprising and even more disappointing. As Wang (1997) has noted, a comparison of mail surveys, content analysis, and face-to-face interviews in the same community shows that survey results grossly overstate PM utilization. Despite this, researchers—and the journal editors who publish their results—continue to produce findings that may be quite misleading for pedagogy and practice (Gianakis and Frank 1998). Because validity is one of the foremost criteria for evaluating the value of a performance measure (Grizzle 1985), the ongoing utilization of fixed-response mail surveys to build the PM knowledge base becomes all the more disturbing.

What methodology would foster a more valid knowledge base that begins to make possible a PM research paradigm which would produce usable knowledge and reality-based pedagogy? Those who were first privy to this problem (Hatry et al. 1990) advocated adoption of service efforts and accomplishment reporting: “Governmental entities should undertake experimentation to develop and test indicators that relate cost (dollars and/or employee-hours) to measures of service results, especially indicators that consider the quality and outcomes of the service” (36–37). Clearly, the beta testing of PM *in vitro* would provide the best answers to the normative questions posed earlier. Such testing would also facilitate a more generic benefit-cost assessment of PM utilization. As Behn (2002) notes, the glaring lack of carefully enumerated benefits (tangible or intangible) remains a stumbling block to more widespread utilization. Beta testing various reporting models could provide such insights on the benefits of PM implementation. Winston-Salem’s \$400,000 annual savings which came as a result of participation in the North Carolina IOG consortium is illustrative of how this approach can be implemented (Jones 1997).

In the absence of real world experimentation, it appears that PM researchers should rely more on open-ended questionnaires, personal interviews, or historiography than on fixed-response surveys.* Contextually rich, longitudinal studies will foster a deeper understanding of successful and unsuccessful PM implementation than simplistic (and frequently one-shot) fixed-choice surveys which tell us little more than that “X percent of respondents feel performance information helps them manage better” or that “Y percent feel PM cannot work in their jurisdiction.” These responses will not provide scholars the knowledge base necessary to advance practice or teaching and indeed may simply do more harm than good by providing a distorted picture of real-world behavior.

PM research which is driven by normative questions and which utilizes an evaluative framework is far more likely to advance practice than the simple reporting of survey results. Those engaged in PM research should take great pains to address the shortcomings of the current research and endeavor to partner with practitioners and their colleagues in other institutions to build a better-grounded knowledge base, one that has a much better chance of advancing practice.

IV. BUDGET THEORY: NEW DIRECTIONS AND REORIENTATION

As long as there are public budgets, there will be academicians who wish to develop theoretical frameworks that describe budget development and execution. With billions of dollars allocated and spent annually, there will almost certainly be successive generations of Antons, Lauths, and Wil-davskys seeking to reduce the complexities of the budget process to a set of propositions or axioms. But as mentioned at the onset, a nagging question remains: Is the pursuit of budget theory an exercise designed to inform practitioners and practice, or is it merely something that goes into a good academic curriculum vitae? This question is not meant to trivialize the study of budgetary theory. Moreover, it is not simply a matter of deciding whether budget theory is prescriptive or descriptive. This question alludes in part to a normative problem concerning whether social science is primarily intended to produce usable knowledge for those in the endeavor being studied or whether it is an exercise intended to illuminate behavior that actors may not see without academic intervention (Ritzer 1975). This, in turn, begs another question: how and in what ways can budget theory foster the economic wellbeing and fiscal survival of the institutions and managers who deploy it (Gianakis and McCue 1999, 2002)?

Gianakis and McCue’s normative assumption is that budget theory should indeed help practitioners operate in a more efficient and effective manner and thus should enhance their respective organizations’ chance for survival and long-term growth and stability. Accepting the Gianakis–McCue proposition requires embracing a pragmatic view of the future of budget theory. In addition, one must subscribe to the normative assumption that budget theory’s propositions should assist those in practice with their operations, providing them with usable knowledge. Of course, doing so means opposing a view of theory development that may seem utterly divorced from the reality it ostensibly describes or explains.

In what follows, I propose some potential avenues of budget theory research that would be beneficial to academicians and practitioners alike—of intellectual interest for the former, of practical service for the latter. No doubt these options are far from exhaustive. But they represent intellectual pathways that could move the theoretical discussion into new directions beyond the dead ends of budget theory research (Rubin 1990).

A. BUDGETING AS A CULTURAL EXPRESSION

In 1975, the City of New York was nearly bankrupt, with over \$13 billion of outstanding debt coming due. Many observers felt that without state or federal takeover, the city would effectively collapse. Within two years, the city’s finances were righted (albeit with federal loan guarantees),

* On assessing the progress of performance budgeting in Florida, see, e.g., Grizzle (1999).

and municipal services were more effective than prior to the near-bankruptcy, despite a nearly 75,000 reduction in employee headcount. New York went on to become the first large city to adopt GAAP accounting, and its performance measurement system became a national model (Caroley 1982; Ukeles 1982). Fast forward to 1994, and consider a very different case. Orange County, California, declared bankruptcy largely as a result of imprudent cash management policies that went awry when rising interest rates proved ineffectual Treasurer Robert Citron's strategy of gambling on future interest rates (Baldassare 1998; Jorion 1995). Within two years of bankruptcy, the County effected a workout plan with nearly 200 creditors and reestablished AAA bond ratings for its debt. Almost two years to the day after Orange County declared bankruptcy, the City of Miami, with a \$68 million deficit, rampant mismanagement, and deep-seated corruption in its senior management and elected officials, found itself on the verge of insolvency (Dluhy and Frank 2002). Even though its problems, though severe, were not on par with the cataclysms of New York City or Orange County, Miami went through five years, six city managers, two mayoral elections (one ordered by judicial fiat as a result of voting fraud), and extensive administrative turnover to overcome its administrative and fiscal woes.

Why did Miami take half a decade to straighten out its fiscal and administrative mess, while New York City and Orange County took less than half as long? The answer is simple: culture matters. After the shock of their respective fiscal meltdowns, leadership in New York and Orange came to painful realizations regarding maintaining a balanced budget and mustered the political, administrative, and technocratic resources needed to implement sound fiscal and administrative practice. An educated upper-middle class, coupled with an alert business elite, contributed human resources and political capital needed to spearhead profound administrative change—a “Crisis Regime” (Bailey 1985). In Miami, no such regime existed. Indeed, as Dluhy and Frank (2002) have noted, many of the city's business leaders were so disaffected with Miami's leadership that they wanted nothing to do with its administration. Meanwhile, an extremely poor electorate, whose primary focus is Latin and Cuban politics, continued to see the city's administration as a conduit for spoils rather than as a mechanism for efficient and effective service delivery. It was only when the state threatened takeover of the city in 2000 that a maverick, reform-minded mayor could begin to make the necessary changes in city administration.

Certainly, discussing culture—defined here in a traditional sociological sense as opposed to a narrower, organizational one—is often difficult. According to Harrison (1992), the concept of culture is viewed with trepidation in certain academic and practitioner circles. Proffering culture as a determinant of policy outcomes inevitably raises questions about which cultural norms are preferable; such a discourse in which these questions are raised makes some queasy. Discomfort notwithstanding, it would be impossible to understand Miami's fiscal crisis without interpreting it through the prism of a predominantly poor, Hispanic population, over 60% of whom were born outside of the United States. (Miami is the second poorest big city in the US; nearly a third of its residents live below the poverty line.) The onset of Miami's crisis—despite long-standing indicators of its financial deterioration coupled with its relatively long climb back to stability was a direct result of its demographics. Unlike New York or Orange County, Miami had no viable middle or upper-middle class that could hold its leadership accountable for honest, competent government (Frank and Dluhy 2003). Add to that traditional Hispanic antipathy towards civic, reformed political culture (Harrison 1992; Huntington and Harrison 2000), and Miami soon came to look like a perfect candidate for anti-best practice in public management.

There is a tradition in budget theory, albeit a relatively new one, which links culture to administrative and fiscal matters. Steven Koven (1999), for one, has deployed the notion of culture in his discussion of tax, economic development, and administrative reforms in local and state governments. Koven draws from Daniel Elazar's (1966) moralistic/individualistic and traditionalistic typology as a basis for his work. In essence, states or cities with immigration paths from Northern European or Anglo-Saxon countries would more likely than not adopt moralistic/individualistic norms, which support reformed government funded via income taxes

that are more progressive than their property or sales-tax alternatives. Contrariwise, states or cities with immigration patterns from Southern Europe or Africa would show more traditionalistic norms—higher levels of corruption, less governmental reform, and greater dependence on regressive forms of taxation. While Koven's empirical studies show mixed results for his hypothesized behaviors and outcomes, the work is a milestone for taking culture out of the closet and integrating it into the study of public budgeting.

Culture at the level of the organization may also play a significant role in whether a state or community adopts and utilizes performance measurement (Ammons 1999, 2000; Grizzle 1999; deLancer Julnes, and Holzer 2001; Behn 2002). It seems clear that without sufficient political and technical support, PM will be difficult to implement. Moreover, organizational readiness for change is itself a primary determinant of success in this arena. Stated differently, many public organizations may be poor candidates for PM implementation. Research that provided successful benchmarks or indicators of organizational readiness could be a boon for potential implementers. Understanding successful organizational determinants of PM appears to be an intriguing and useful matter in the budget theory realm.

B. BUDGET FORMAT AND ALLOCATIONS AS INDEPENDENT VARIABLES

Research in the budget theory realm has often focused on the budget format as a target or dependent variable that reflects the politics and operating culture of the polity or organization. But what if the tables were turned: Can budget format be seen as an independent or causal variable? Do cities, states, or other organizations that adopt performance-oriented budgets achieve better fiscal performance (e.g., larger than peer fund balances, higher bond ratings) over time? Do the entities that adopt high-end use of PM (i.e., linkages with strategic plans, budget allocations, and personnel appraisals) obtain better bond ratings and higher citizen satisfaction with services? These questions require careful consideration.

Klay (1987) asserts that agencies which take the risk of articulating clear program theories and outcomes should be rewarded for these actions with enhanced appropriations. These agencies should also be allowed to retain all or part of their unexpended balances and offer bonuses to employees as they see fit. By way of example, recent experience in Coral Springs, Florida, suggests that adoption of a performance-based budget and management system has paved the way for change in the municipal organization and its politics. Elected officials adopted a less parochial perspective on allocations, coming to understand that good performance was good politics. At the same time, employee performance and enthusiasm took a significant upswing. And the results were significant: Coral Springs became the first public entity in Florida to win the Sterling Award, Florida's equivalent of the federal Baldrige Award. What was once a city with marginal reserves and non-rated debt had now achieved AAA ratings from Standard & Poor's (M. Levinson, personal communications, 2002; City of Coral Springs).

Thus the question: can performance-oriented budgets be a catalyst for organizational development? As demonstrated earlier, the costs and benefits of PM remain largely unsubstantiated. Even so, this line of questioning might provide practitioners with the right outlook for investing the time and effort needed to adopt performance-based budgeting and management in their communities.

Timothy Bartik (1991) and Rauch (1995) have illuminated another aspect of the budget as independent variable—the long-term economic impact of expenditure configurations. Specifically, they have asked: do certain budgetary allocations, particularly in the realm of physical and human capital (i.e., in the realm of education), lead to improved economic development outcome variables such as lowered unemployment and higher growth in real personal income? Their work suggests that investment does matter and that state and local governments which consistently spend more money relative to how much their peers spend in these areas reap significant rewards in the aforementioned economic outcomes. When one considers that shrinking real income is often thought to be the catalyst

for the public's antipathy towards government and tax rebellion attitudes of the last quarter century (Kirlin 1982), one should welcome Bartik and Rauch's findings which are of great importance to public administrators. Unfortunately, academic public administration has paid limited attention to the connections between macroeconomic conditions and the administrative state (Carroll 1992; Frank 1992; Klay 1981). Whether this blindness is the result of ideological biases in the discipline against wealth generation of market forces or whether it is the result of impermeable disciplinary boundaries remains an open question. If Kirlin's (1982) assertion is correct and real wages are a prime determinant of the public attitudes toward government, then neglecting longitudinal studies of the linkages between expenditure patterns and economic outcomes would amount to a lost opportunity for a more relevant, practitioner-oriented study of budget theory.

This argument is in line with Gianakis and McCue's proposition (1998, 2002) that the budget process is perhaps the ultimate driver of organizational stability and growth. What this suggests is that linking budget allocations to economic development outcomes could confirm the suspicions of those who assert that government investment in people and places plays a critical role in economic competitiveness (Carroll 1992; Thurow 1980). Such studies could, in turn, provide at least some countervailing intellectual rationale for government intervention at a time when government is viewed as the enemy in a number of circles. This would be a positive spillover for budget theory development.

V. CONCLUSION

However it morphs in coming years, inquiry in public budgeting theory is likely to be right in the middle of two intellectual tugs-of-war: the first, political rationality versus analytic prowess; the second, socioeconomic stasis versus historical dynamics. The budget process reflects a synthesis of economics, ideology, history, and technocracy. None in public budgeting can afford to neglect these determinants of the budget process; nor can they afford to neglect its outcomes.

The widespread use of microcomputers in government and at home is likely to improve the quality of analysis deployed in the budgetary process. Virtually every major trade and professional association has a website that provides surfers with information on best practice. Elected officials, citizens, and civil servants alike have access to a wealth of knowledge unfathomable to prior generations. Asking the question—how and in what ways the Internet changes discourse in the budget process and how it changes the expectations of its many actors—is likely to bear fruit for those who study the development and execution of budgets.

Computerization aside, it is noteworthy that a conservative, Republican-controlled Congress and President saw fit to extend the Government Results and Performance Act (The Mercatus Center 2006), first passed under President Clinton in 1993. While GPRA has been inconsistently implemented by federal agencies, its continuation symbolizes that enhanced accountability is increasingly embedded in the body politic. The era of fiscal constraint that commenced with Proposition 13 in 1978 has not ended. Those who see the current broad-based interest in PM as a fad should think again. There is no doubt that PM as an ideal type supersedes current facts on the ground. Nonetheless, the groundswell of support for PM at all levels of government suggests that a bottom line orientation is slowly but surely coming to the fore in the public sector worldview. In theory as well as in practice, PM is likely to play a dominant role in government operations in the coming years. Those engaged in the study of public budget theory will feel obligated to study its implementation in a structured, theory-driven manner (Martin 2002).

Regardless of substantive direction, researchers in the budget theory realm should heed the advice of Forrester (1997) and Yeager (1992) and recognize that much of the research in public administration shows little accumulation and often fails to gel with practitioners. This shortcoming may not be easy to resolve given the discipline's chronic lack of external funding and our predilection for survey-driven, one-shot case studies. But if we fail to diversify our methodological portfolio, there is a real possibility that scholars in the budget theory realm will fail to correctly

represent the reality they are studying. In a professional discipline, this failure is doubly important as it heightens the risk of steering pedagogy and practice in the wrong direction. With this cautionary note, we conclude by asserting that the study of budget theory presents both a challenge and an opportunity to scholars and the discipline.

I. INTRODUCTION

Without constraints on length and time, a chapter on the history of decision making might well encompass thousands of years of human history and a dizzying array of approaches to the challenges of uncertainty and ambiguity. If the scope of goals and tasks for practice and research in public administration decision making proves vast, individual and collective decision making is important enough that the realization of those goals and tasks has value.

Recognizing such limits, a more parochial approach is adopted in this chapter, restricting our discussion to post-colonial public administration decision making in the United States. Even within this constraint, this chapter offers an overview of portions of a vast body of practice and scholarship. Moreover, this section serves as a starting point for further investigation.

Our presentation follows a broad chronology. Our selection of particular developments reflects a concern with the nexus of individual and collective decisions. The discussion has concerns for rationality in public and administrative decision making and the balance among elites and publics as the legitimate force behind binding, collective decisions. This introductory section offers a rationale for our focus and selection; a framework for organizing the analysis of decision making problems, practice, and research; and an outline of the specific topics to be covered.

Our concern with the interrelationship of individual and collective decision making has roots in the nature of public administration research and practice. Public administration has developed to become an endeavor to find and achieve rational ways to maximize collective welfare. While it is surely true that: “Administration is ordinarily discussed as the art of ‘getting things done’” (Simon 1997, 1), it is accepted that public administration is policy making (Appleby 1949, 169). Public administration inescapably centers on collective efforts to sort ends and means at a variety of social and organizational scales of common interest. Research in public administration also analyzes individual administrators’ decisions that ultimately determine what collective decisions are made and how effectively and efficiently they are carried out. These questions of *for whom* and *by whom* decisions are and should be made are central to two of the long-running concerns of American public administration: centralization versus decentralization and the effort to reconcile democracy and efficiency. Relevant theories and practices of decision making, therefore, cover the formation and aggregation of individual decisions. Theories and practices also concentrate on steering individual decisions toward the faithful execution of the common interest. Developments are emphasized that enhance our understanding of the interdependencies of individual and collective decision. Particular attention is paid to the question of how society has allocated legitimacy and actual decision making authority among elites and masses as American Public Administration scholarship and practice have portrayed them. Within those boundaries, this presentation

emphasizes three major analytic themes. First, it adopts the distinction between the judgment and choice aspects of decisions as articulated by Goldstein and Hogarth (1997) and uses it as a way to understand the concept of decisions. Second, it adopts James March's (1994) formulation of ambiguity and uncertainty as two pervasive and fundamentally different ways in which limited knowledge creates challenges for decision makers. Our third, and in some ways most fundamental concern, is the ways in which institutions structure both individual and collective decisions. Each of these themes will be briefly discussed below.

Our first theme looks at the decomposition of decisions into judgments and choices, or conversely with the composition of decisions out of judgments and choices. The body of psychological research on decision making can be divided according to whether it focuses more on judgment or choice (Goldstein and Hogarth 1997), and this analytic distinction can readily be extended to apply to decision making research and practice more generally. Judgment involves arriving at some understanding of situations, probabilities, causes, and consequences—the psychological appraisal of information—and implicates problems of knowledge, learning, and the discrepancies between the objective environment and human perceptions of those objective conditions (Simon 1997). Preferential choice involves the selection of courses of action, whether to achieve some expected utility or consequences in accordance with given preferences and an instrumentally rational “logic of consequences,” or else the selection of a course suggested by a less instrumental “logic of appropriateness” that emphasizes the inherent rightness of choice over calculations of consequences (March 1978, 1994). Goldstein and Hogarth trace contemporary research into intended rational-instrumental choice to the specification of utility by von Neumann and Morgenstern in the 1947 second edition of their seminal *Theory of Games and Economic Behavior*, 1972.

We define a decision to be a complex of some combination of one or more judgments and one or more choices. The combination of judgments has both positive, or descriptive, and normative, or evaluative, facets. Our sense of decision making lies in its being an inherently normative procedure overall with deliberate aims. Decision making can intend to achieve a better state of the world or to preserve an existing, desirable state of the world. Decision making can entail pursuing an appropriate course of action, rejecting available choices that lead to undesirable states, or simply failing to choose or act. The making of decisions, whether by individuals or collective parties, is significantly complicated by the twin challenges of uncertainty about the probabilities of events and consequences and ambiguity concerning causes, effects, and preferences. Uncertainty and ambiguity challenge the decision maker in both judgment and choice. Uncertainty proves the more tractable of the two, because it can be reduced or at least partially accommodated through the judgment-enhancing systematic collection of information about reality and about the probabilities of events and effects. Developments from the early formulations of probability theory in the 16th century, to the post-WWII boom in applications of operations research and formal analysis, to recent developments in computer-assisted data mining and decision-support systems, have sought to enhance rationality in the face of uncertainty by providing more and better information and analysis. At the same time, uncertainty or vagueness about the precise nature or likely consequences of certain policy decisions or states of the world may facilitate agreement among decision makers. Ambiguity resists systematic solutions. Ambiguous circumstances do require orderly discernment, despite a lack of clarity or consistency about reality and preferences (March 1994). Together with the usual multiplicity and incommensurability of goals and preferences associated with collective decision making, ambiguity poses challenges for both judgment and choice that are not readily addressed by additional ex-ante factual information or analysis. Rational models of decision making, for example, presume stable and relatively well-behaved utility functions that can serve as the basis for preferential choice, and additionally presume that actors possess adequate judgment about at least their own wants. Ambiguity, rooted in the boundedness of human rationality as well as in the tendency for human knowledge of reality, identity, and preferences to be constructed at least in part through social processes, undermines the foundations of rational judgment and choice and points to the employment of practical reasoning and logics of

appropriateness (Berger and Luckman 1967; March 1978; Scott 1995). In plain language, the problem of ambiguity in decision making is that even as individuals, we cannot always know exactly what we prefer, or that we will always want what we want now. For some understandings, such as conventional policy analysis, this is troublesome, while for others, such as the zone of acceptance central to Simon's (1997) conception of decisions in and by organizations, it is part of what makes cooperation possible. By decomposing decision making into the two sub-activities of judgment and choice, and by recognizing that decisions are made under conditions of both uncertainty and ambiguity, the technical problem of decision can be represented as comprising four basic elements, as depicted in Table 7.1. Judgments involve both positive and normative assessments of actual and possible states of the world. Tasks of positive judgment include determining what the actual state of the world is, at least in relevant part, and what causal relationships pertain to transform states of the world. Normative judgments are required to establish whether, for instance, current states are desirable and whether alternative states can be imagined that might be more or less desirable. Similarly, choices can be calculative, based on instrumental logics, or practical, based on logics of appropriateness. Uncertainty complicates positive judgment and the calculations of causality that undergird calculative choice. Ambiguity undermines our certainty about normative judgments and conceivably also our determinations concerning the inherent appropriateness of a particular choice. Administrative and policy decisions by their nature involve all four elements, because they involve evaluations of the desirability of actual and imagined states of the world as well as assessments of the actual characteristics of the world and the causes of alternative states, and choices grounded in logics of appropriateness as well as in logics of consequences. Thus, administrative and policy decisions are also subject to both uncertainty and ambiguity.

Finally, our concern with the interdependence of individual and collective decision making necessarily involves some degree of attention to social institutions—the shared systems of rules by which action is structured and order made possible (DiMaggio and Powell 1991)—because it is institutions that link the two, whether by design, accident, or both. Scott (1995) describes three broad ways in which institutions are understood to mediate the relationship between individual and collective decisions. First, institutions may operate in *regulative* fashion, employing coercion to make rationally self-interested individuals behave in accordance with rules meant to advance collective rationality *in spite of* individual rationalities seeking to advance exogenously formed individual preferences. Alternatively, institutions can operate through *normative* or *cognitive* mechanisms. These understandings place institutions as the antecedents of individual preferences

TABLE 7.1
Generic Problems, Elements, and Sub-Elements of Decision Making

	Judgment	Choice
Uncertainty	Positive judgments about the probabilities of current or future existence of particular states of the world; judgments as to the causes and effects of particular events and choices	Choices of means and ends based on instrumental logics of consequences: seeking to select the (best) means most likely to result in the most desired (best) ends
Ambiguity	Normative judgments about the desirability of particular states of the world; judgments about the appropriateness or inherent desirability of specific means to those ends	Choices of means and ends based on practical logics of appropriateness: seeking to select the means and ends that are the right ones, often as determined by institutions

G., *Bell Journal of Economics*, 9(2), 587–608, 1978; March, J. G., *A Primer on Decision Making*, Free Press, New York, 1994.

and judgments: institutions influence not just individual behavior, but the beliefs individuals hold about what is true and what is desirable. In this social-constructionist perspective, institutions are held to shape not just decisions but more fundamental decision premises as well. That is, they operate to influence the underlying logics of appropriateness that govern many aspects of judgment and choice, including choices about appropriate methods of, and participation in, decision making.

Additionally, the rules that constitute institutions operate in three interdependent “worlds” or levels of institutional rules: the “world of action,” or operational level, in which action is pursued and strategies about future choices and actions adopted; the “world of collective choice,” in which binding collective decisions are made about policies and operational arrangements; and the “world of constitutional choice,” in which rules are formulated to govern the process of arriving at collective decisions—“decisions about decision rules” (Kiser and Ostrom 1982). The design of constitutions, public policies, and administrative procedures can be understood as collective decisions. Collective decisions on these designs are premised, alone or as a group, on the ways in which individuals form judgments and make choices. The judgments and choices are bound by particular human institutions useful in compressing, extrapolating, or projecting individuals’ interpretation of particular states of the world.

The problems of decision making for public administration, then, implicate questions about the desirability of both the ends and means of making decisions, both states of the world and the ways in which our judgments and choices are developed. Thus, the problems of decisions for public administration entail matters of allocative as well as productive efficiency in the achievement of governance and policy outcomes. They also involve the effort to provide efficient processes for arriving at collective decisions and reconciling them with individual ones. Indeed much of the scholarly normative concern with decision making in public administration since the emergence of public administration as a self-conscious field of study has had to do with problems of efficiency in decision processes and outcomes, and of reconciling efficiency with popular democracy. For present purposes, the task in this essay is bounded by focusing on the question of balancing elite and mass roles in decision making. The question focuses on how prevailing institutional arrangements have balanced influence among elites and among publics in efforts to respond to the public interest by achieving desirable outcomes and processes of decision making. Elites include those whom any observer could identify as empowered by heredity and birthright, wealth and economic position, political power or electoral success, or professional training, markers that set them apart from the mass of humanity in terms of their ability or fitness to decide public questions. These elites may serve in administrative positions to decide matters in their own or the public interest. This essay will attend to the history of United States administrative decision making. In doing so, how the relationship among various elites and publics was created, defined, and institutionalized within the separation of powers, how those elites have responded to collective needs and priorities, and how they have made decisions to promote good governance, are described. It is argued here that—at least up until the end of the twentieth century—a progression can be traced both in the actual influence of various elites and in the degree of legitimacy accorded to the dominance of public decision making by them. The first part of our history traces the expanding power of the presidency from the Washington administration to the beginning of the reform era after the Civil War. The second section covers the period from the start of the reform era to the end of World War II. The third section depicts events from the end of World War II to the present. Each part narrates the primary events and the climactic trend, and each scrutinizes the role of administrative decision makers and what was expected of them. In particular, the definition of elites and their relationship to governance is examined and elite definitions of responsiveness and public interest are discussed. For example, the first section covering roughly the period 1787–1883 asks whether the rise of mass politics led to the overthrow of one elite—drawn from those who deserved to rule because they were born with the right or came to it through social position or wealth—only to replace it with another, one based on political success. In the second section on the reform era to the end of World War II, evidence is sought of institution building to bound political decision making and free

administrators to become a technocratic elite entitled to decide policy alongside political elites. In the final section, the period after World War II, the managerial approach to decision making is examined. This approach may not answer fully the responsiveness question—who should respond to whom in governance—but it does try to perfect decision making as a technique and as a science.

II. FEDERALISM AND SEPARATED POWERS

The separation of powers formed the basic decision making institutions in the US Constitution. The separation of powers operates through the checks and balances provided in duties and opportunities given to leaders in the three major branches of government: legislative, executive, and judicial. Separation of powers operates at two sovereign levels in a federal structure. The branch and level structure of separation predicts the existence of randomness and conflict. The structure has constants nevertheless. The most important constant is the one-office limit in which the Constitution and later statutes forbade a person holding more than one office at once in the three branches of national government and the two levels of national and state government. Unless elected, that person assumed office through the actions of at least two of the three national branches.

Reflecting the liberal democratic theory argument that separation of power permits representation of values in society (Hill 2004), the decision makers in government also stand for institutional values. Kaufman (1956) outlined three elements of the doctrine of public administration that can also serve as institutional values. Representativeness refers to a legislative body, politically neutral competence to administrative agencies or bodies expected to have specialized expertise, and strong central leadership to the executive—president or governor. As for representativeness, the people through their elected representatives know best. The State or nation can have no kings or tyrannical executives; no taxation without representation; and “no money ... drawn from the Treasury, but in Consequence of Appropriations made by law.” This tendency toward representativeness is also a tendency to have elections. Everybody who holds office should stand before the people election, reelection or recall, it was thought. As for politically neutral competence or expertise, those reformers who argued in favor of taking the spoils system, the corruption, the politics out of administrative management professed belief in neutral competence or the value of expertise in decision making. Let honest experts find the best way to execute the laws or implement the programs the legislative body created, they said. The core value lay in letting the work of government be done expertly—experts chosen on the basis of merit—and do it according to explicit, objective standards rather than personal or party or other obligations and loyalties. As for executive leadership, fragmentation of interests and government structures demands efficiency and effectiveness. Only strong leadership—the idea of unity of command—can effectively deal with large problems like natural disaster, war, or economic depression.

The limits on power to act, to risk stalemate, balanced with responsiveness, have led to a good governance emphasis on decision making by neutral competent authorities. Growing from efforts to balance the risk of stalemate with the growth of power, and also with a will to be responsive and accountable to both the public interest and the people, bureaucracy has become, many find, the center of power. There one can see combined managerial, political, and legal forms of decision making once thought to risk tyranny when not separated, checked, and balanced (Rosenbloom 1983). In any case, the separation of powers offers an institutional way of explaining decision making. Separation of powers offers researchers a basis for a claim of legitimacy in its elaboration of formal powers, a necessary element of traditional institutionalism (Wilson 1885). Separation of powers may or may not exist for either functional or legitimacy reasons. Observers contest the function the separation of powers serves. Consider Vile (1967) whose emphasis on values to embody in procedure-governed administrative agency governance has much to offer a study of the history of decision making in the United States. He argues that ideas about equilibrium and balance dominated thought about government power during the time leaders debated the provisions of a Constitution. Moreover, Vile believes the eighteenth century emergence of concepts like

division of labor and specialization gave debates about balancing power some depth. Both balance and specialization led to the ideas in the nineteenth and twentieth centuries of a frame of reference institution brought to decision making (Schön and Rein 1994). Vile (1967, 15) defines the frame of reference idea as “the demand for different sets of values to be embodied in the procedures of the different agencies.” Thus, “the diffusion of authority among different centers of decision making is the antithesis of totalitarianism or absolutism,” (15) Vile could argue, and the separation of powers functions to control power.

Freedom is a second function of the separation of powers. Hill (2004) argues that the separation of powers facilitates pluralism of interests and helps guarantee the checking and balancing of any one by the others. The pluralism idea Hill has in mind is one of different groups of people voting and controlling by balancing or even exploiting the clash of interests represented by different aspects of society. He elaborates on the liberal idea that a balanced diversity of interests serves to preserve liberty. The idea, he says, “underlies both the horizontal division of powers between the three branches of government, and the vertical distribution of power between the federal government and the states” (582–583). Freedom and liberty, Federalist No. 51 argued (Hamilton et al. 1961; Kurland and Lerner 1987), developed from the policy of supplying, by opposite and rival interests, the defect of better motives, and the division of power between the national government and the states provides double security... [so that] the different governments will control each other, at the same time that each will be controlled by itself. Therefore, Hill argues: “Counterbalanced interests throughout society serve as a corrective to democracy by controlling the majoritarian tyranny that can endanger it” (2004, 583).

Beyond the control of government, separation of powers also brings about the control of the governed, Hill says, especially in the strength of the factionalizing tendency among people in the United States but also in making a majority on more than a limited number of issues less likely.

Hill further argues that the checks and balances, separation of powers idea exerts an extended influence over other areas of society. Mimicry or simply the same tendency toward factional interests pervades sectarian and other social relationships. Hill points out that tyranny becomes less likely as other representative institutions compete, creating religious freedom and valued diversity, a wider distribution of property, freedom of speech and of the press, as well as trial by jury.

Hill raises interesting questions about the downside of diversity and the acceptable limits of association. He asks whether a sense of community develops as a way “to give the individual a meaningful sense of participation, thereby fostering the virtues of positive freedom, and as a buffer against expansion of the political sphere ...” (Goodhart 2004, 585). Or does the sheer diversity and intensity of individual interests dampen a will to participate communally, to give up to the community a good part of one’s authenticity as an individual?, Hill asks. If control of power and liberty do qualify as functional arguments for the decision making underlying the separation of powers and federalism, what about efficiency? The efficiency idea has haunted discussion of basic institutional structure at least since Woodrow Wilson (1887), if not directly in *The Federalist Papers* written by Alexander Hamilton. Gwyn (1965) sees a basis for efficiency in arguments about the separation of powers. In history:

The answer of Charles I to the Nineteen Propositions, without actually mentioning the term executive power, was very similar ... [to the idea] that those activities called legislative can best be performed by one kind of institution while those called executive can best be performed by another... (32).

Should the legislative body serve with no executive, naturally, a smaller committee of the legislature would take executive powers. Gwyn argued that legislative organization evolved because expeditious pursuit of legislative and executive duties required it. The view of separation of powers Gwyn relates has only an incidental concern with maintaining liberty. Rather, efficiency in the making of decisions underlay Charles I’s advocacy of an independent executive.

The version retold by Gwyn implies a reactive role for a legislature and even a judiciary rather than one balanced with the role of the executive. Such a natural role may exist in the United Kingdom, from which vantage point Gwyn writes, but history does not clearly side with that natural role in the United States (Wilson 1885).

Efficiency has often become an irrelevant consideration in judging the institutional decision making derived from separation of powers and federalism. Popular credit goes to President Harry Truman for the comment that whenever one finds an efficient government, one finds a dictatorship.

Lewis (2004) gives further support by recalling Supreme Court Justice Louis D. Brandeis' views. Brandeis made the argument that the separation of powers, including the creation of an executive "with great powers of initiative" was meant "not to promote efficiency but to preclude the exercise of arbitrary power" in his dissenting opinion in *Myers v. United States* (272 US 52, 293, 1926). The relegation of efficiency to some lower status may have posed a problem and explains why concern arose as executive power and administrative agent discretion grew (Peabody and Nugent 2003).

A. THE FEDERALISTS AND THE GOVERNING CLASS

The well-known debate between Alexander Hamilton and Thomas Jefferson about the powers of executives and the national government consequently has masked the real achievements of the Federalists, the original ruling group in the United States. White (1978) contrasted the Confederation with the constitutional government that existed at the beginning of Washington's second and last term as president. White said that when Washington took office as chief executive, practically nothing existed as a government. When Washington's two terms ended, he left a vigorous government. White noted: "The departments of [the national government] had been established and each was making its contribution to national unity ..., revenue ... [was] flowing into the coffers ..., the credit of the country had been restored ..., a diplomatic and consular service was stationed abroad ..., the Post Office was steadily extending its routes ..., [and] laws and revenue collections were being enforced in federal courts" (2–3). What institutions and decisions, what process of decision making, had led from almost nothing across tall, strong barriers to this happier state?

The question "What decision making?" has less to do with specific battles won than with the victory of a ruling class. White (1951, vii) gives the credit to fundamental agreement won about Federalist ideals and practice. The first ruling group, composed of Jefferson, Hamilton, and supporters of both their points of view, differed internally on political differences but decided with more ease "the manner and spirit of conducting the public business," so much so that Jefferson inherited "a going concern" from Adams and Washington. Did executive and national decision making power win over legislative and local power? Clear-thinking historians agree that the initiative in the executive branch, perhaps aided by a strong Hamilton treasury, and the strong national responsibility Jefferson as president accepted and advanced, won and, Jefferson found, made sense.

The more important lesson for decision making may lie in the covariates or even the seeds out of which the Federalist decisions grew. Consider White's (1978, 6–8) view of the first administrations as growing out of ideas about human beings' indefinite perfectibility and their control of their fate through institutions.

In control of one's own fate, energetic, perfectible—all seemed to describe an individualistic political culture. The culture rewarded individual merit and effort (Webber and Wildavsky 1986). However, groups at the turn of the eighteenth century contested the process of reaching perfection. Federalists, history tells, regarded an elite as rightful process designer and leader—defending a hierarchical culture. The Federalist elite approached governance with energy, decisive action, creativity, willingness to experiment, and pragmatism. The Federalist approach may help explain the wellsprings of success in the first Federalist administrations. Most of these qualities correspond commonly to executive action, not legislative consensus building or reactive judicial scrutiny or rumination. These qualities correspond to a top-down, national government-dominated society, not

a bottom-up federalist one. White (1978) always associates Hamilton with energy and decisive action, quoting him to the effect that: “Whenever the government appears in arms [and probably in every other role], it ought to appear like a Hercules, and inspire respect by the display of strength. The consideration of expense is of no moment compared with the advantages of energy” (511). Some hierarchy emerges from almost all analyses of the Federalist party’s administrations under Washington and Adams.

Bailyn (2003) connects the founders with provincialism as well as elitism. This provincialism is an extremely creative sort. The founders, he says, are like provincial artists who use their “simplicity and common sense ... [who are] concrete in their visualization, committed to the ordinary facts of life as they knew them ... have fresh energies [and lack] affectation and cynicism” (6–8). The founders, and especially the Federalists, Bailyn believes, felt they could question old-world assumptions and unless shown proof otherwise, try what no cultivated European thought possible. For example, Montesquieu and his admiration of the English constitution led him to admire also a separation of crown, nobility, and commons (Bailyn 2003; Montesquieu 1748). The provincial founders would experiment with the separation of powers in government itself.

Experimental the Federalists may have been, but they were not naive. A government could grow corrupt unless led by those superior in education, in economic standing, and in native ability (White 1978). Energy, decisiveness, creativity, readiness to experiment, and pragmatism were the required characteristics for the governing elite.

Only the able might bound the energy of the masses within a set of rules that ensured decisive action. The idea of merit had a specific meaning for the Federalists. Nevertheless, the distrust of the masses led the Federalists to the Sedition Act and the destruction of their political party. The distrust of the masses came from the feeling that the masses easily become “the dupe and tool” of a domineering faction (Washington 1939–1940 (1793)). The domineering purposes to the Federalists were the goals of groups who aimed to subvert the government and Constitution, hence “sedition” (Prince 1970; Smelser 1954, 1958; Smith 1966).

1. Jefferson

Jefferson commanded an era that projected Federalist ideals and practice, White argues. Jefferson himself calls his approach logical (Lipscomb and Bergh 1905):

Difficulties indeed sometimes arise; but common sense and honest intentions will generally steer through them, and, where they cannot be surmounted, I have ever seen the well-intentioned part of our fellow citizens sufficiently disposed not to look for impossibilities (112).

White, using this wisdom as a contrast, observes that Jefferson was skillful in using his decision making power for “far-reaching political ends” (White 1951, 4) and found himself forced to exercise [power] ruthlessly (White 1951). Jefferson, and the Democrat-Republicans who followed, Madison, Monroe, and Adams, became strong executive-centered presidents. Jefferson’s view of national power may lie in both opposition to the Sedition Act and pursuit of the Louisiana Purchase, Madison’s in the war of 1812 and realization of nationhood, Monroe’s and Adams’s in defense of national power even with a share given to Congress, especially in all cases in knitting together geographic sections of the country with canals, roads, and other internal improvements financed by the national government (Forsythe 1977; Larson 2001; White 1951). White argues that Congress became more assertive and the Jeffersonians more solicitous of state agreement in national measures. However, war as well as geographic and economic growth forced the hand of government so that the Jeffersonians ... carried the Federalist [institutional] machine forward without substantial alternation in form of in spirit for nearly three decades (White 1951).

Along with assertiveness by Congress and the President, the judiciary became powerful through Chief Justice John Marshall. His work in *Marbury v. Madison* (1 Cr. 137, 1803) created what

Corwin (1973, 173) called “that highly distinctive feature of American Government, Judicial Review.” The distinction lies in the power of the US Supreme Court to review state laws and acts of Congress on a case-by-case basis. Chief Justice Marshall seems to have ruled in a manner similar to Hamilton’s arguments in *Federalist* No. 78:

The interpretation of the laws is the proper and peculiar province of the courts. A constitution is, in fact, and must be regarded by the judges as a fundamental law. It therefore belongs to them to ascertain its meaning as well as the meaning of any particular act proceeding from the legislative body. If there should happen to be any irreconcilable variance between the two, that which has the superior obligation and validity ought to be the course preferred; or in other words, the constitution ought to be preferred to the statute, the intention of the people to the intention of their agents.

In the separation of powers sense, Marshall claimed a position for the courts as equal to the other branches, establishing a check over the acts of Congress. By implication, the decision established a check for the courts on the implementation of them by the President. Future decisions starting with *The Genessee Chief* (12 How. 443, 1851) gave the doctrine of stare decisis some flexibility by establishing for the Court the right to review and overturn previous Court decisions. The chief justice also claimed a position of strength for the national government relative to the states. *Marbury v. Madison* established the US Supreme Court’s dominance over state courts, especially when the Supremacy Clause of the Constitution (Article VI, Section 2) supplements the precedent set by the case.

III. THE MID-EIGHTEENTH CENTURY

Andrew Jackson came to the presidency as a war leader, a strong executive. Yet, more aptly he rode the swell of rapid change. Jackson gained the presidency as a result of a popular vote for electors in all states but Delaware and South Carolina, having done so due to widespread abolition of property and tax-paying requirements for voter participation.

The industrial expansion of the country had begun as well. As White describes the scene in 1829 when Jackson became President, steam railroad construction began an industrial revolution. The revolution propelled the growth of the United States through a rise in manufacturing, cities, and corporations.

Economic and social development had effects in political life as well. The right to vote spread rapidly, according to White (1954, vii), as wide enfranchisement of adult white male citizens and their taste for electing most, if not all, officials “rapidly became the rule ... [and] democratic dogmas overwhelmed Federalist and Jeffersonian ideas of a governing elite, and the mass political party replaced the congressional caucus as the means of selecting candidates for the White House.”

The impact of representativeness on public administration was a step in another direction from a ruling elite. If everyone need be elected, almost everyone had a right to vote, and everyone not elected had a right to a government job. White calls the practice of filling the bureaucracy with political supporters “the rule of rotation.” The practice clearly gained acceptance, as rotation took place not only when one political party succeeded another but when one faction within a party defeated another. White (1954, vii) recalls substantial “constitutional debate, party conflict, and sectional strife, comprising an era of tension that overshadowed the steady normal operations of government” during the Jacksonian era. The period also had “a remarkable stability in the structure of government and at the same time a profound change in its quality and its standards.”

Where did remarkable stability and profound change in government quality and standards come from? White (1954, 3) argued that Jackson inherited and accepted Jefferson’s political views: “The views led Jackson to a strict construction of federal powers, to reliance on the states, and to a guarded use of authority found in the Constitution ... that matters went well when the government

left people alone ... [and] frugality and economy in governmental operations, ... as well as the final discharge of the public debt.”

Despite his war experience and comfort with command, Jackson was not the civil administrator that his successor James Knox Polk became. According to White (1954, 69), Polk “devoted himself to detail not only by preference, but on grounds of principle, and great was his satisfaction when he could record at the end of an evening’s labor that he had cleared his table...” “I prefer to supervise the whole operations of the Government myself rather than entrust the public business to subordinates, and this makes my duties very great,” Polk once wrote (Quaife 1910, 130–131).

Along with dutiful and duty-oriented presidents and stable government, the Jacksonian period saw the birth and development of a national political party system. White (1954) remembers Tocqueville’s opinion (1899, I, 254) that adults who were not slaves took pleasure in politics and debated issues at length in every hamlet. With the end of the Congressional party caucus in 1824, White argues, the political party system that began at the state level informally and then formally began to serve as the national nominating device for the presidency. Certainly a centralizing force, the party system overcame or counterbalanced some of the restraints imposed by separation of powers and the strong separation of national and state governments.

The biggest issue of all was rotation. White justifies it as the biggest issue (1954) because rotation contrasted so clearly with the Federalist-Jeffersonian practice that “no man was subject to discharge for difference in political opinion or for a free expression of his political views.” The view lasted through Jefferson’s replacement of Federalists with Republicans. In fact, White (301) recalls Jefferson’s warning “about the ‘rottenness’ that begins in a man’s conduct when he casts a longing eye on office.” White concludes, “[The] expectation of federal office was held down by the scarcity of vacancies in a stable service, by choice from among those holding a ‘respectable’ station in social life, [and] by presidential success in holding off congressional interference...” The times changed and, White (1954, 301) says, “in the turmoil of ... politics a strident, pushing, and insistent type of office seeker took the place of the respectable sons of Federalist or Republican families.” The rotation led to changes among administrator jobs as one party succeeded the other but also from succession of one faction by another within parties. One observer noted that the desire for office had led patronage to threaten the popularity of any president despite his talent or accomplishments. Rather, office seekers as a group held the balance of power between the two political parties (White 1954).

Rotation grew with the length of the ballot, and one tendency reinforced the other. Democratic sentiment led voters to demand the election rather than the appointment of more leaders. Kaufman (1956) observes the rather uncritical faith in the electoral principle. Belief in elections took the form of universal adult male suffrage and an increase in the number of offices filled by competitive elections. Hundreds of names on the ballot meant that change in parties led to an almost complete turnover of the administrator corps. Each leader also commanded a certain amount of patronage, and leader succession helped rotation grow.

“Efficient?” we ask today. Probably not, White relates. Political parties, the long ballot, and rotation increased decentralization by investing power locally rather than nationally. More decisions, White says, were made by officeholders based on the advantage provided in controlling office and power than on the analysis and debate about policy. Political obligation became the basis for most decisions in the legislative and executive branch and at both national and state levels.

Consider rotation in terms of Rourke’s ideas about responsiveness before ceding rotation away as inefficient and thus useless or wasteful (1992). Jacksonian democracy has often paralleled thinking about the Reagan era (1980–1988) of the presidency and beyond that to the early part of the twenty-first century. Some have called the Reagan era and beyond neo-Jacksonian democracy (Kelly 2005). The argument is one of blunting distrust of government by placing in office individuals with whom citizens, voters, and taxpayers identify personally. The average, or the median voter or householder or consumer is the best to serve as a public administrator. If the median voter is in office, the thinking goes, discretion is used as the voter intends or would use it if

he or she were in office. The median voter in office as public administrator also speaks to Rourke's ideas of responsiveness. If responsiveness, the argument holds, may be defined as the change from the status quo in policy development and if the median voter is largely indifferent to change, the nation needs no independent public administrator to apply expertise with partisan neutrality. Rather, change comes from the political entrepreneur to whom the public administrator owes deference, because the political entrepreneur is a partisan, achieving office through election. A modern representation of political responsiveness in allegiance to a politically elected leader, allegiance felt by both the indifferent-to-change median voter and the deferential public administrator who resembles the median voter in thought and deed is found in the argument. In other words, in neo-Jacksonian democracy, a reprise of the politics-administration dichotomy is found. The political draws deference from the administrative activities in government based not so much on bureaucratic specialization as belief in the moral superiority of politics.

The Jacksonian period could be called a populist one, given the controversies over the Bank of the United States and the theory of nullification. In the bank case, economic power came from the bank's ability to issue promissory notes that some thought of as soft money. Hard money believers opposed the banks, whether the bank was a national one or was one of many state banks because they created inflation, sooner or later economic contractions, financial servitude, and disruption. During the early 1800s, people in the Western states felt that interests in the Eastern states benefited from banks at their expense. State rights advocates believed in state banks but not the national bank. Jackson's war against the national bank, one he eventually won, may have strengthened the states rights advocates. In the nullification controversy, Jackson opposed Calhoun's states rights doctrine, based as it was on the argument that states could nullify a federal law because the origin of the Constitution lay in the will of the states, rather than the people, in ratifying the Constitution. Issuing his Nullification Proclamation in 1832 (Wilentz 2005), he argued that the origin of the Constitution lay in the will of the people; that the nation existed before the states ratified the Constitution.

With both controversies, the national bank and the theory of nullification, one might understand that Jackson argued populism at the expense of major, powerful institutions, the national government and the national bank. Yet, following Riker (1982), one might see Jackson as opposed to any elite, whether state-related or merely institutionalized, but supporting the Constitution. One might see Jackson as supporting the will of the people to have the right to elect whom they please and replace them at the next election. Riker defines the populist view to follow the rule: "the opinions of the majority must be right and must be respected because the will of the people is the liberty of the people" (14). Voting is not simply another institution, Riker's populists would say; it is the judgment of right and wrong.

In this sense of populism held by Riker, rotation in office, in the context of the bank and nullification controversies, suggests the populist theory of administration. In staffing the administrative agencies, Jackson's populism, Karl (1976) observes, follows the idea that administration is a public service and politically appointed administrators are a more accurate reflection of the public, its needs as well as its desires, than any administrative professional would be likely to be. The Jacksonian theory of administration complements a bigger theory of strong national government in neutralizing the rule of an elite, whether that elite was Eastern business interests or the interests allied against the tariff and favoring state nullification of laws creating the tariff.

IV. THE CIVIL WAR AND RECONSTRUCTION

Between Jacksonian democracy and the reform era lies an era of institutional development ignored by public administration. Leonard D. White provides no guide, and the literature of public administration history has no major champion of the period other than Karl (1976), yet Alexander (1981) calls the era pivotal in the history of institutions. He argues for a reassessment of the role of the Civil War in any analysis of "the efficacy, even viability, of our political institutions" because the

Civil War “is not some monstrous [bloodletting or] extreme value that has to be excluded to make possible a sane weighing of the pros and cons of institutional performance, [rather] it was a fulfillment of our political institutions.”

What political institutions and how fulfilled, anyone can ask; Karl (1976) provides an answer. He describes the Civil War as a period of growth of presidential power as well as astute use of spoils as Cayer does (this volume). Karl emphasizes both the admirable and irredeemable in the era overlooked or neglected by a serious analysis of administration. Karl (500) argues, “No presidency since Lincoln’s has managed to reach such levels of unconstitutionality.” Karl mentions Lincoln’s call for troops to go to war without Congress’ initial consent, spending money from the Treasury without appropriation, the suspension of habeas corpus, “and Lincoln’s use of military force to assure his re-election in 1864.” Karl judges Lincoln’s use of power one that makes the “hanky-panky” of modern-day scandals involving presidential power look amateurish and “even more childish.”

Justification for executive power is not hard to find. Karl says that both Lincoln and Roosevelt get admiration for refusing to let legal principles stand in the way of compassionate or emergency use of their offices.

Bensel (1991) places Karl’s view in the perspective of preceding events. He describes the earlier time as one in which the Federalists such as Hamilton had attempted to establish a strong executive, but the national government was one dominated by the states with only a relatively weak presidency and Congress, one favoring Southern interests in free trade and low protectionist barriers relying on tariffs and “... a mere shell by 1860—a government with only a token administrative presence in most of the nation and whose sovereignty was interpreted by the central administration as contingent on the consent of the individual states.” That situation quickly changed and then unraveled with the Civil War and Reconstruction.

From the Civil War until the end of Reconstruction, DiLorenzo (2002) points out that Republican party and state were the same. Monopoly in the form of the Republican party expanded the power of the state and Northern industrial and financial interests. In turn, these interests provided the money for the party’s activities.

Policy followed the outlines of mercantilism and protectionism, dictatorship, and total war. Tariff rates increased. A federal income tax bureaucracy came into being. Federal government leaders levied excise taxes and repealed few after the Civil War. They also established a national bank system and, with taxes on state bank notes, tried to drive state banks into bankruptcy. Congress financed even more internal improvements and financially aided the new corporations and railroads. Agriculture aid and military pensions, DiLorenzo says, created strong interest groups in addition to corporations lobbying for favor in Congress. On the economic side, Republican party Congressional power forced policy toward intense economic development through necessity.

To some, including DiLorenzo (1998), President Lincoln imposed dictatorship and total war. As DiLorenzo observes, Lincoln initiated and conducted a war by decree for months without the consent or advice of Congress. As well, DiLorenzo relates other of Lincoln’s dictatorial acts: “declaring martial law; confiscating private property; suspending habeas corpus, conscripting the railroads and censoring telegraph lines; imprisoning as many as 30,000 Northern citizens without trial; ... and shutting down ... Northern newspapers” (DiLorenzo 1998, 263, citing Randall 1951). DiLorenzo accuses the Republican party of creating “three new states—Kansas, West Virginia, and Nevada—[to help] them rig the 1864 elections” (DiLorenzo 1998, 263, citing Donald 1956, 79). Lincoln’s presidency marked the intense development of the institution’s powers.

Reconstruction and the near-conviction of President Andrew Johnson after impeachment left Congress with substantial power. The freedom experiment or an experiment without race as the basis for liberty unfolded. Emancipated slaves gained freedom, some small amount of economic independence, and Congress and the states added the Constitution’s 13th, 14th, and 15th amendments. Yet, the experiment provoked “a ferocious reaction,” and in “the face of fraud and terror, the freedmen’s white allies, north and south, abandoned them” (Goodman 2006, 23;

Foner 1988, 2005). Government corruption increased and the *Crédit Mobilier* scandal came to represent the impact of Congressional supremacy. Bense (1991) suggests that financiers stopped a prolonged reconstruction that would have confiscated and redistributed land to build a stronger Republican party in the South. Bense contends that financiers opted instead for financial and social stability, further investment in the West, and less state direction of the economy anywhere.

Understanding the influence of business interests, was the United States a corporate state? The period between the Civil War and World War I represented the rise and interconnection of business taxation, activist government, and corporate capitalism. As Higgens-Evenson (2003) interpreted the period, some states and the federal government followed the vision of Alexander Hamilton, while other states followed a path advocated by Thomas Jefferson with the Hamilton group undertaking many large, ambitious tasks and the Jefferson group offering limited public services. As a way of understanding the origin and development of the relationship between government and business, Higgens-Evenson suggests the fundamental differences in the approaches the states took.

The development of transcontinental railroads stimulated the transformation. Again, Higgens-Evenson (2003) observes how many other industries developed and began to depend on nationwide markets and, therefore, railroad transportation. The telegraph system relied upon railroad lines for lines and further consolidated national markets through the communications system.

The internal improvements placed governments in the role of stimulus for economic development. Governments had played that role in the Jacksonian era, only to run up debt and often default during the 1837 economic depression. The stimulus effort began as the Civil War's need for railroads prompted further investment, growing still further with the investment in the race between the Union Pacific and the Central Pacific to join in Utah.

The railroads influenced much more than government investment. Most important, says Higgens-Evenson (2003), were the techniques that helped railroad administrators manage their vast enterprises including everything from capital equipment to timetables.

These techniques along with financial ones bred mimicry and a definite following among other industries and eventually government. Higgens-Evenson also points to the size and scope they permitted, especially the introduction of mass production and a survival of the fittest mentality in business. Higgens-Evenson points out that "firms ... integrated vertically, by buying up their suppliers and distributors, as well as horizontally, by buying up their competitors [and economic contractions or] depressions in 1873, 1893, and 1907 [allowed] well-positioned firms to buy out their weaker competitors and increase market share" (3). Bigger and bigger, corporations grew.

Hamilton-inspired business aggrandizement prompted Jeffersonian suspicion among farmers, laborers, and small business people. The suspicion grew to the point that government regulation became a reality. The first regulation of railroad rates and business practices grew into its institutionalization through the creation of the Interstate Commerce Commission in 1886. The Commission became a regulator to the Jeffersonians and, to the others, a national method of regularizing the varied paths the states took in dealing with railroad impacts and the unpredictability state efforts created for business expansion. Such national regulation would further competition with the institutionalization of antitrust efforts in the Sherman Act of 1890, some argued. Regulation crested in Wilson's presidency with the 1914 Federal Trade Commission Act and the Clayton Act.

Shortly after the regulatory crest, business got bigger and government financing needs for World War I prompted a major compromise between business and government. Henry Ford's success in mechanizing assembly line auto manufacture created mass production for mass consumption, and ideas spread across firms, leading to an ever-higher rate of growth among businesses. World War I created a worldwide demand for US products. The war also led to windfall business profits. Business efforts to gain a financial stake in the war prompted further government regulation of railroads, a takeover, and heavy taxation of business windfall profits.

Revolutionary change occurred in government as well. Women gained the vote. Open primaries, initiative, and referendum affected political parties, helping prompt the growth of interest groups and the dwindling interest in voting. Interest group representation of business and government regulation grew to an accommodation in what became the American corporate state. Such a state represented the responsiveness of government to influence by labor and the Progressives as well as the willingness of governments at all levels to tax business firms. The state also represented the smart decision by business leaders to cooperate with institution of corporate taxes and in so doing, become the major interest group in favor of tax reform and granting government a stake in business profits. Higher taxes led to pressure by business people to persuade government regulators to grant higher rate charges and to outlaw their competitors on the grounds that such competition would diminish their profits and hence the state's revenues (Higgins-Evenson 2003).

Progressivism led to growing government activity—positive government—institutionalizing public infrastructure construction, public education, and public welfare. Each level of government retained the power to borrow and the power to tax. Business leaders, probably gladly, agreed to concede responsibility for local infrastructure, schools, and income relief for their employees and families in return for paying taxes, chief among them the national personal income tax created through the ratification of the 16th Amendment to the Constitution.

What can anyone say about the American corporate state? Higgins-Evenson (2003) does not hesitate to recall the legacies of Hamilton and Jefferson. He points out that the rise of the corporate state fundamentally altered the relationship between government and business. For example, he argues that government administration drew much of its efficiency logic from business practices. Government also gained expertise (9) as “Business officials had gone from bribing and black-mailing state legislators to helping them run government on a paying basis.” Government deferred to business as “state officials ... abandoned their biennial attempts to soak the corporations and instead asked them to set their own tax rates” (9). The states also pursued business in characteristically Federalist or Republican ways as the state's political culture dictated, starkly differing but with some declaring, as Higgins-Evenson recalls, that that the new methods of government were using “Hamiltonian means” to accomplish “Jeffersonian ends.”

The most important insight gained from the era relates to institutionalism. National government regulation and taxation institutionalized the vision of interstate commerce prompted by the Constitution. Yet, states created institutions as well, from regulation and taxation to those giving them the lead in providing roads and canals, and the primary role in establishing public education and public welfare systems. Business firms depended on governments to regulate business competition and promote economic development. Governments depended on business firms for cooperation in a policy making process centered on an institutionalized, symbiotic relationship between business and government (Lindblom 1977).

V. THE ERA OF ADMINISTRATIVE REFORM

The period of administrative reform followed the resurgence of Congress. History marks this period as reactionary, with action countering the rise of political parties. The response to political parties' subversion of the electoral process lay in creating and building civil service and budget institutions to prevent political party entrenchment in office and corruption of elections (Frant 1993, 994; Milward 1978, 393). Kaufman (1956, 1059) argues that the long ballot and the rotation system led to confusion among voters. He observes that confusion “opened the way to power to political bosses who, while providing a measure of integration in the bewildering pullulation of government, often [advanced] their personal interests and the interests of the [political] organizations they headed [heedlessly]” (1059–1060). Disillusionment resulted, Kaufman relates, and the disillusioned called for reform.

The history of decision making to this time can suggest three ways in which anyone might understand administrative reform. First, the establishment of national power over the states, in the Civil War and Reconstruction through the principle that the union of states had a greater legitimacy than any state or group of states, through the evident superior force that might be brought to bear on major issues of state versus union, but also through the larger resources that lay at the national government's disposal. The power of the national government also had become evident as a force to balance national elites, especially a business elite. Second, events through history established a strong, unitary executive branch with the president as chief user of national power, checked by Congressional appropriation power and the right of litigants to contest the president's use of power in the courts. Third, the establishment of rotation in office, the spoils system, as a means of selection of the "good administrative decision maker" became a time bomb to go off after the Civil War.

The upshot of the three forces was the focus on the deliberate use of national power, rational, considered, and thoughtful. The unitary nature of the executive branch made administrative institutions inevitable. The spoils system became the focal reason for disillusionment.

Consider also a few lessons from the previous century. The administrative apparatus was small through the first century, and more, the government was small at all levels. The primary job was protecting the growth of the US economy through tariffs. Government leaders also allocated the revenue from tariffs and taxes as well as borrowed money to be able to make internal improvements. Improvements aimed to grow the economy further, to expand the country to provide still further growth. Leaders had the responsibility to protect the country from threats external and internal—and keep the country united.

In the previous century, the greatest struggle was the need for protective tariffs against the need for external markets, forcing a struggle to keep the country united even as the states contested the federalist structure and tried pull the country apart. Skowronek (1982, 29) called the early US history a period of "statelessness." He said that the national government left governing and any substantive task to the states.

Government size was the most important feature during the period before administrative reform took place. According to Wilson (1975):

1. At first, the federal government grew slowly with the State Department having ten employees, the Attorney General, close to the same number, War, 80, and only a few thousand soldiers, and Treasury several hundred employees.
2. Only the post office grew, accounting for 86% of the growth in federal employment to 36,672 by 1861.

Wilson (1975) explains that until the Civil War, the number of federal government administrative employees grew because public demand for government services increased, not because government assumed new tasks or administrative imperialism reigned. Rather, the increased demand existed for what were "bureaus of personnel performing essentially routine, repetitive tasks for which the public demand was great and unavoidable ... [responding only as] as population and commerce expanded" (81). The national government had little administrative capacity, and even more important, had few functions, Wilson observes. Small government persisted for almost a century after ratification of the Constitution. Stillman (1987) reported that federal government employment exceeded 50,000 in 1871.

The question then becomes: what decision making might be studied, institution or no institution binding it, when there is almost no one to decide or at least very little discretion? Certainly, dual federalism, the compact, or states rights meant something before the Civil War.

What these terms may have meant was distrust for any elite and opposition to government power. Skowronek (1982) argues that Jacksonian democracy led to the breakdown of the

professional class, the burgeoning aristocracy of merit on which the Federalists might have built a state and local government administrator class. He noted that the Jacksonian era's reaction to elites

rekindled America's anti-institutionalism and ... anti-intellectualism. The result was a ... nightmare come true. State legislatures swept aside the protective bulwark of the early bar by establishing general criteria for recruitment into the professions. Barriers on entry to legal practice were relaxed, local controls were nullified, and recruitment into the professions was opened wide. By 1850 formal professional associations had virtually disappeared from the American scene (33–34).

With a decline in professions, little apparent need for government administration, and a clear preference for infrequent government intervention in social and economic affairs, one might ask what happened.

Bustle and a survival of the fittest attitude among the movers and shakers is one way to describe the time. Consider the evidence:

1. The internal improvements encouraged by state governments, as well as the bonded debt for transportation and banking (English 1996)
2. Pet banks that developed as a result of President Jackson's removal of federal deposits from the national bank (Scheiber 1963)
3. The development of the railroad corporation through state debt
4. The development of both massive wealth among corporation leaders and stockholders and calls for control of the economic chaos resulting from railroad competition

The latter competition led to "dangerous chaos" with aggressive pricing and efforts at "ruining a business rival, forcing a merger, building up or tearing down a city, or punishing a state that threatened to impose restrictions on the managers of railroad corporations" (Larson 2001). The bustle led to calls for change.

The president and governors were relatively strong in exploiting situations within their control, the Louisiana Purchase, the national bank, and the military and diplomatic efforts in the Civil War. They were relatively weak given the nature of governmental decision making, that is, creating and enforcing the protection for the internal economy, making internal improvements, and pursuing Reconstruction, all of which were matters for Congress or state legislatures. Only in times of war, defensive wars and then expansive wars, did the president have control of an administration.

What changed everything? First, the rise of the presidency to activism with few limits to its power to decide matters related to his role as chief diplomat (Jefferson and the Louisiana Purchase), chief executive (Jackson, the spoils system, and the national bank), and commander in chief (Lincoln) mattered. The activist presidency implied the administrative capacity to fulfill those roles with administrators chosen on the basis the president required. Second, the rise of the market system as a result of almost continuous investment in improvements in the nation required an infrastructure of laws and regulations to enforce property rights and the right to contract as well as prevent collusion and to encourage, sooner or later, free trade. Finally, the administrative state developed on the basis of good administrators as experts and specialists responsive to the institutional imperatives designed by the president, Congress, and the courts after experiment and rejection of both an aristocratic elite and rotation in office.

Therefore, one of the reforms dealt with the definition of a good administrative decision maker. The content of the definition amounted to the substitution of merit as the basis of appointment to subordinate offices, at best an avenue for expert judgment rather than political loyalty. At worst, the definition heralded a return to the Federalist idea of a ruling class, the sanctification of business expertise, or a substitution of ideological loyalty for political party membership (Villanueva 1993; Waldo 1948).

A. NEUTRAL COMPETENCE OF EXPERTISE

The desire for competence and expertise created the need for a non-partisan source. Kaufman (1956) defined the need as “the ability to do the work of government expertly... according to explicit, objective standards rather than to personal or [political] party...” At the same time, the fundamental institution to which neutral competence and expertise should answer as the rules of game did not change. Kaufman (1960) says that the promise of institutionalized expertise would not “demean representative institutions [but would] strengthen those institutions by rationalizing governmental operations and improving their quality to such an extent that elected officers would be in a position to exert greater control over policy than they ever could hope to do in the prevailing political jungle.” Competent administrators could help fulfill the promise and purpose of representative institutions.

The case for expertise held that individual representatives through their consensus building decision making regimes set the goal of government work, and neutral competent administrators did the work of government. Yet, the case had its disdainful side as Kaufman points out. Some argued that the aristocracy of talent was a necessary reform, because rule by the masses had failed. The patricians issuing from generations before joined the urban mercantile and professional groups to support civil service reform. Hamilton and the Federalists reemerged in spirit.

B. A RULING CLASS

Waldo (1948) discussed the idea that public administrators should have “a place in and claim upon the exercise of modern governmental functions...” Why? He reiterates this ruling class argument as a high-stakes one (93):

In general the claim is that the conditions of the modern world require a large and skilful body of bureaucrats, administrators, or experts; that the scientific method and the vast changes which it has brought about in the externals of life, the existence of the nation-state (or hope of a world-state) system, and the demand by all classes of society that government be used as an instrument for achieving the Good Life—that these stupendous factors compel us to recognize the necessity for a “governing class.”

Waldo reflects the idea that the scientific method, or positivism, will open vistas for change more probably than political consensus building or political competition. Frames, reformers might argue, have very little to do with scientific investigation; only attention to method assures “the Good Life” through either “a Philosopher-King or a Communist or Fascist Party charged with a greater responsibility than preserving civilization” (91).

C. BUSINESS EXPERTISE

Strangely or not so strangely, expertise took on the modifier “business” to suggest the self-explanatory source. Waldo (1948, 91) senses this unmistakable, unarguable source in the early writings of the reformers as “a strong presumption that the businessman is the “expert” who is entitled to rule. The businessman has built this civilization; so he is morally entitled and mentally equipped to run it.” Waldo recognizes dissents from the “business is sole source for administrative expertise” view, including Wilson (1887) when closely read. Rather than a business manager, public administration required a non-partisan administrator, one whose primary loyalty was not to a political party, and a person not elected to office, one steeped in the value of efficiency “whose responsibility can be unmistakably fixed” (1887, 213). With the twin emphases on efficiency and responsibility, Wilson continued (1887, 213):

If administrative study can discover the best principles upon which to base [a distribution of authority in government], it will have done ... an invaluable service. Montesquieu did not, I am convinced, say the

last word. . . . All sovereigns are suspicious of their servants, and the sovereign people are no exception to the rule; but how is this suspicion to be allayed by knowledge? If that suspicion could be clarified into wise vigilance, it would be altogether salutary; if that vigilance could be aided by the unmistakable placing of responsibility, it would be altogether beneficent. Suspicion in itself is never healthful either in the private or the public mind. Trust is strength in all relations of life; and, as it is the office of the . . . reformer to create conditions of trustfulness, so it is the office of the administrative organizer to fit administration with conditions of clear cut responsibility which shall insure trustworthiness.

Wilson builds a theory of public administration on efficiency, expertise, and clear-cut authority aimed toward the ultimate object of trust by the sovereign people. However efficiency, expertise and clear-cut authority may be defined, the trust of the sovereign in the administrator is Wilson's ultimate objective. In this way, Holzer et al. (in press) have noted the strange complement public choice theory provides to Wilson's theory, that efficiency as an independent variable makes more sense than as a dependent variable, that trust in public administrators makes far more sense and difference. Wilson's (1887) metaphorical explanation has a large participatory element, and he explains:

The ideal for us is a civil service cultured and self-sufficient enough to act with sense and vigor, and yet so intimately connected with the popular thought, by means of elections and constant public counsel, as to find arbitrariness or class spirit quite out of the question (217).

The Wilsonian ideal administrator takes the best from the Federalists and adds the essence of someone aware and responsive, one-person political leaders and citizens can trust. Our interest in Wilson's view relates to how much more closely his comment implies a Jacksonian model, rather than the model of expertise and specialization described by others such as Hecló (2002). Wilson's comment does reveal the quintessential expression of an irresolvable tension between democracy and expertise.

The trust lies in the administrator and not the efficiency with which an administrator does the job and, most of all, not in elected officials. Frant (1993, 994) argues just this point when he says, "Statements of the late nineteenth-century civil service reformers do not reveal great concern about the difficulty of measuring output in the public sector, nor do they generally evince great disdain for the public sector as such. They do show a strong distrust of elected officials, but this distrust was far from irrational. It was based on an established fact of life: that elected chief executives could use their control of the political process to entrench themselves (or their party) in office, thereby subverting the electoral process." The distrust of elected officials hit a high mark in the civil service reforms. Milward (1978, 393), reflecting the feeling of the period in accounting for the reform causes and consequences, says, "... it was necessary to take politics out of the civil service and vice versa [and only] through depoliticization would it be possible to deny the spoilsmen patronage, their chief political resource, and thereby relegate the bosses to a minor role in the political system." Getting rid of corruption, rather than achieving efficient administration, dominated concern during the reform era. Rosenbloom and Obuchowski's (1977, 9) review of thinking in the era led them to argue that the civil service reform movement was only a part of an entire political system that reformers wanted to change. Efficiency became an intermediate goal, subordinate to the replacement of an entire class of politicians exploiting the masses.

Loyalty might be an underlying force, however, behind civil service reform. Patronage may have survived as a value in public administration. Villanueva (1993, 276–277) points out that, in hindsight, civil service reform has become an entry point for a "new patronage system." Recruitment may take place among those "who were ideologically compatible with policy objectives [of the president] ... whose views were compatible with his ideas on how foreign [or domestic, fiscal, monetary, or executive branch management] affairs should be managed." Early, reform era administrators may have supported reforms, and later the public policy aims of strong government presidents (Rourke 1992, 541–542). Patronage changed to loyalty in political ideology from loyalty in political party membership.

D. BUDGET REFORM

The executive budget reform movement resolved the conceptual conflict between a ruling class of neutral, competent, business-oriented experts and the ideologically loyal presidential followers in public administration. In this movement, different groups vied for the normative high ground. The competition took place with different metaphors of governance, as well as distinctive ways to build a budget institution, and alternative explanations for the institutional constraints on individual decisions. Reformers also created the local and national budget systems as now known.

The budgeting literature, from its early reform period to the present, has elaborated a normative model of what should take place among government agencies and between branches of government as well as within government agencies. In this section, this model is reviewed in the forms it took in the municipal reform movement, the state reorganization movement, and the national government's executive budget movement.

1. The Municipal Reform Movement

The traditional history of the reform period, from 1890 to 1920, draws a picture of reaction. Reformers reacted to a situation in which immigrants voted on long ballots for bundled groups of machine candidates who assumed office in a fragmented structure and then went about processing voter demands and lining their own and their cronies' pockets, driving up taxes and expenditures to the detriment of the middle and old-moneyed, patrician classes (e.g., Adrian 1987; Hofstadter 1955; Schiesl 1977).

Reformers reacted with a call for representativeness in political structures of a different sort. A genuine political community, not merely coalitions on both sides of a partisan struggle, would be achieved (MacDonald 1988). Specifically, according to Lineberry and Sharkansky (1971) the reformers had:

1. An aversion to "politics" as a means of arriving at public-policy decisions and specifically to political parties and organized interest groups
2. An holistic conception of the community, a belief that there is a single interest of the "community as a whole" to which "special interests" should be clearly subordinated
3. A strong preference for professional management of community affairs, implying preference for public policy-making by technical experts like the city manager
4. A strong faith in the efficacy of structural reform

At the root of the problem of partisanship was the ward election system in city governments of the time. Through divisions of the area, machine candidates could directly cultivate and exploit the new immigrant blocks, usually in homogeneous blocks of people who arrived from the same country. The machine politicians could then bundle their own ward candidates and run them without fear of their being able to be contested as a slate (Adrian 1987). The reformers tackled the problem head-on. They proposed at-large political offices that would be filled through non-partisan elections. The reform produced the desired results, a dramatic fall-off in participation (Lineberry and Fowler 1967).

The reformers also proposed a centralization of power in the form of strong mayors with executive powers. These powers included the ability to appoint, through a combination of political appointments and a merit system, the most qualified experts and specialists to run city departments. This departmentalization of expertise would be coordinated through principles of orthodox management, narrow spans of control, and a chain of command. The work of the city government would be financed by a budget in which the various needs of departments as determined by experts would be presented and deliberated over by the mayor and a council of at-large elected council members. The responsible administration that was created as a result would be held accountable on

the basis of economy and efficiency by the electorate (Adrian 1987; Schiesl 1977). In summary, the municipal reform model is the clearest normative model of budgeting today. The model views a genuine political community as operating with leaders elected at-large to represent the community's interest as a whole, an administration staffed by experts headed by a strong mayor with executive powers, including a budget through which process the work of the city could be financed economically and efficiently.

2. The State Reorganization Movement

The reforms at the state level generally reacted to legislative supremacy and its problems. As White (1933, 207–208) has pointed out before reform, “the typical state agency or institution prepared its own estimates, submitted them directly to the appropriations committee, ultimately received an independent appropriation, and spent its funds without supervision other than that provided by the auditor.” Such a system had led to an increase in total expenditure of the states by almost 650% over two decades, muckraking that revealed public ineptitude and corruption, and a growing following for “the new gospel” being spread by scientific management proponents (Cleveland 1915; Schick 1971):

The new gospel's provisions included an executive budget that resembled that developed in the municipal reform movement and included three perspectives. The first or planning perspective enabled the governor to use the status of sole representative of all the people to produce an authoritative statement of policies and programs (15).

From the second or management perspective, partisans argued that the governor be chief coordinator. The executive would “standardize and consolidate agency estimates and... ensure that the budget facilitated the efficient conduct of the public business” (Schick 1971, 16). The management perspective linked the budget with the reorganization movement itself, the chief goal of which was to functionally consolidate fragmented agencies and strengthen the executive's appointive and removal powers.

The third or control perspective would deter waste and fraud. The governor would become the state's chief controller, installing centralized purchasing, accounting, personnel, and internal audit controls to protect against corrupt or inept officials.

The tradition that developed as executive budgets were installed, however, limited executives' roles in the process. The legislative bodies guarded their constitutional duty and prerogative to appropriate by trading some of their former financial powers for control over expenditures. Schick observes (1971, 18):

De facto, the governor became the control agent of the legislature; his job was to present the budget accounts in a way that facilitated detailed legislative scrutiny of agency requests and enabled the legislature to intervene when it wanted to. The conception of the governor as active policymaker fell by the wayside, although his potential for this role remained.

In fact, Schick argues, prior unfettered agency initiative in the preparation of estimates did not change; rather, it provoked the creation of a centralized control role for the executive in checking unconstrained spending requests. Unchanged agency initiative and the new centralized check over it also displaced a policy and planning role.

3. The National Executive Budget Movement

The federal executive budget followed lines similar to that in the municipal reform and state reorganization movements. The movement at the national level emerged from the confluence of seven factors. First, Progressives wanted to head off the agrarian radicals and their proposals for

greater levels of government spending (Savage 1988). Second, Republicans wanted but did not have enough support to pass the Payne-Aldrich Tariff. Third, Progressives wanted but did not have enough support to pass the income tax. Fourth, Republicans blamed the panic of 1907 on spending and on the deficits of 1908, 1909, and 1910. Fifth, agrarian populism led to a widespread demand for schools, roads, and other government services. Sixth, the idea of centralized administration as essential to promote efficiency and accountability caught on as a result of the efforts of members of the Bureau movement (Waldo 1948). Finally, alarms were raised over World War I spending.

In reaction, over a period from 1907 to 1921, four major financial management events cascaded. First, centralization developed in the Treasury and in the Congressional appropriations process in the collection, reporting, and consideration of expenditure and revenue measures. Second, Congress passed parts of the Payne-Aldrich tariff that placed a 1% tax on corporate incomes above \$5000. Third, Congress passed the individual income tax. Finally, Congress passed the Budget and Accounting Act of 1921.

For budgeting, the 1921 Act brought centralized management into being, and it created a balance between the legislative and executive branches in pursuit of financial management as a whole. Mosher (1984, 33), following Stourm (1917), divides the ideal budget process into four steps and assigns responsibility in this system to a branch. These steps appear in Table 7.2 as a picture of the ideal budget system.

The ideal system balanced the branches and provided checks of one over the other. The creation of the income tax, despite its later dilution and laggardly implementation (Savage 1988), complemented the budget act and led to the maintenance of balanced budget symbols. The ideal budget system created an answer to the economic question in providing that the chief executive steer the economy. The ideal also answered the accountability question in providing responsible, hierarchically oriented management. Finally, the rational decision making approach offered a technically elegant way of joining steering to responsibility.

If neutral competence and expertise guided recruitment and retention of government administrators, that expertise became the hammer to the nail of fiscal problems. Through reform, the idea took seed that (Kahn 1997, 1) “A program may be good or it may be bad, but if it does not pass budgetary muster, it is dead.” The budget criterion served legislators who found the fiscal impact of a program easier to evaluate than policy or simply merit. The downside for decision making became clear. Information about a program’s advantages would come from a reading of the values and needs of constituents, but a program’s fiscal impact could come only from the analyses done by experts. These experts were steeped in an ethos of fiscal control—accounting detail and government revenue limits. More important, Kahn’s budget experts personified basic Progressive era

TABLE 7.2
The Ideal Budget System

Step	Branch	1921 Act
Preparation	Executive	Bureau of the Budget (BoB)
Appropriation	Legislative	Congress through appropriations committees
Execution and control	Executive and legislative	Agencies, BoB, General Accounting Office (GAO)
Post audits	Legislative	GAO

values—“efficiency, responsibility, accountability, politically neutral professionalism, management skill, fiscal integrity, parsimony” (Kahn 1997, 2).

Before reform, many observed an agglomeration of administrative fiefdoms serving members of Congress and their committees or local political machines with limited constituencies. The agglomeration of particularistic interests took public money and used it for the gain of each member of the committee or the political machine (Fisher 1975, 21–27). The national government collected revenue from a tariff and followed a policy of protectionism in trade internationally. Smithies (1955, 59–60) explained that:

a government that could rely on customs revenues enjoyed special privileges. The political pressures were in the direction of higher taxes rather than lower. . . . Revenues flooded the Treasury. . . . [Fears] that embarrassingly large surpluses should be used as arguments for lower protective tariffs. . . . [outweighed concern] about high expenditures [and extravagance]. . . . There was no process whereby the benefit of expenditures was weighed against costs in terms of taxation. . . . It is straining human nature too far to expect economy in the face of a budget surplus.

The revenue flood continued through the 1800s, except for a brief Civil War interruption. Congressional fragmentation, post-Civil War corruption (Dunning 1907, 229–293), and the appearance of deficits in 1903—due to pension bills, rivers and harbors projects, the Spanish-American War costs, and the cost of constructing the Panama Canal—brought Congressional inquiries, recognition of municipal reforms, and a realization that the president was the “protector of the purse” (Fisher 1975, 25–35). After reform, Kahn says that budgets became institutions. Budget institutions, he says (119), came to demarcate the public sphere of government action and thereby became indispensable referents for public discussion [“should this go into the budget?”] . . . a coherent, interrelated, and unitary state . . . [;] “imagining” the state, political actors were able to proceed to conceiving of more activist possibilities for the development and application of its power.

After the early twentieth century, Kahn notes (1997, 119), as budget reform extended to all governments in the US, the budget became “the ultimate means both to identify social problems—[if it gets into the budget, it’s a significant social problem]—and to represent what government could and should do.” Budget reform institutionalized action for the common good, and it identified the budget expert as the key decision maker in connecting public problems with government-administered solutions.

Reform, Kahn says, created a new theory of executive power, one in which accountability played the largest part. Kahn depicts a complex, growing federal government and a Congress without the institutional ability to take the leadership role. Realizing that the president had a far better institutional capacity for management and even leadership, members of Congress delegated. The thinking in Congress, Kahn said, amounted to the sense that only a hierarchy, a unitary government with “a single chief executive sitting atop a pyramid of bureaucratic authority” could produce a responsible and efficient government. If the practices of budget reform hold true to their promises, the Congress would become the principal and the president Congress’ agent. The delegation of authority from Congress to the president would work if members of Congress could define the task clearly and determine whether the task was completed successfully.

Kahn recognizes the logic in Congressional delegation of power leading to a gain in Congressional control. Congressional oversight, and accountability, lay in clear, certain delegations of authority. The system would create efficiency and responsibility in a strong executive who must account for his actions to Congress. The logic and the executive budget system could institutionalize Congressional or representative government’s control over a potential tyrant, and the logic and system could transform an elite corps of bureaucratic experts into a set of agents working in the interest of executives as leaders and ultimately of the people through Congress.

E. THE RISE OF THE BUDGET IDEA

Four different models vied for hegemony among reformers; we have begun to understand. One model is democracy. The model develops from the New England town meeting dealing with the tragedy of the commons (Hardin 1968). The model provides for wide participation among those with a stake in the outcome of decision making. All who participate have sufficient knowledge, and all, more or less, see the world in the same way, else they would not have a reason to participate. All have equal rights to participate, although some of the more able and respected take leadership roles. The purpose of the budget lies in proper use of the commons, the economic and social use of common resources. Finally, the purpose of the institution, all agree, is to represent “mutual coercion mutually agreed upon” (Hardin 1968, 1247–1248).

A second pro-business or corporate model exists. In this model, only taxpayers and bondholders vote. Organization managers maximize the use of taxpayers’ and bondholders’ resources, again pursuing economic development as a goal. Managers account for the returns from development to taxpayers and bondholders. Therefore, taxpayers and bondholders are consumers of private and public goods provided by government and must receive value for money.

A third progressive, positive government model competes (Dahlberg 1966; Kahn 1997; Schiesl 1977). Decision making may or may not include anyone other than managers and analysts. These legitimate decision makers take goals as given, represented in what taxpayers presently finance and for what purpose. The decision makers determine how well the costs and benefits of the work are distributed in terms of a decision rule such as: from each according to his or her wealth, to each according to need. Decision makers measure how well the government work is done—how well the work done in one program compares with the work done in others, the marginal rate of return. Decision makers believe in the fundamental proposition that government institutions are instruments for doing good, the common good, for solving social problems that developed as a result of industrialization and urbanization. Decision makers believe in the need for publicity of what the experts find important. Strong executives must order the work to make it efficient, thus they dominate government institutions. Decision makers, finally, believe that what government institutions do, when publicized, shows what the public responsibility is—what the responsibility for and to the commons is and that all with a stake in the commons delegate to government responsibility for efficient action.

The fourth model is a settlement house government model. Following (Addams 1902, 1905; Stivers 2000) and borrowing some from the Progressive Positive government group—government is an instrument for doing good, the common good, for solving social problems that developed as a result of industrialization, urbanization, and immigration. Social analysts conduct scientific surveys of social conditions. The surveys help determine the breadth and depth of social problems by talking with the poor and having the poor shape the interpretation and convey the significance of the social problems. Another survey or investigation helps the capacity of government departments to deal with the social problems. The capacity is found by talking with public managers, but the analyst interprets the information and conveys its significance. Analysts make the case for the budget to build capacity and direct that capacity to solve social problems based on data from the surveys. The analyst also reminds public managers and leaders of the citizen’s right to information and keeps efforts at oversight and surveillance going with strong citizen participation.

The models represent elements of need, merit, and mutuality. The models represent different ways to define the idea serving the common good. The actors represent the models as well.

Kahn (1997) describes the primary actors—the ABCs—and two other influential ones in budget reform and the evolution of government institutions and individual decision making during this intense reform period. First, William Allen was (1997, 47) “the publicist, focused on using budgets to create an educated citizenry capable of exercising intelligent control over their elected officials.” Allen was also “... an advocate, exhorting the general public to educate itself to full citizenship...” He urged and motivated members of the public to transform themselves into a kind of mass elite.

Second, Frederick Cleveland (47) was “the technical expert, [an accounting and finance professor at New York University who] concentrated more on educating public officials and devoted his time to the mechanics of administrative reform (47)”. Cleveland was “... a dispassionate investigator, addressing fellow experts and bringing the tools of scientific reasoning to bear on discrete problems of administration” (47).

Third, Henry Bruere was “the administrator, sought to maintain a balance between the two tendencies (and the two men)” (47). Bruere “... succeeded at building bridges between the bureau and government officials.”

Two others amplified the themes of the ABCs. John D. Rockefeller, Kahn argues (1997), wanted no work done by the Bureau of Municipal Research with his money outside New York State and no dabbling in issues that other experts might deal with better. Rockefeller, according to Kahn, wanted the Bureau to be a useful, local, fiscal, and technical advisory institution. At a financially sensitive time, Rockefeller offered \$10,000 for five years and help in raising another \$100,000. The sensitivity arose from the expiration of several substantial five-year grants the Bureau depended upon would expire and, when the principals at the Bureau accepted Rockefeller’s offer, effectively curbed Allen’s efforts to identify social problems and utilize budgets as solutions.

William F. Willoughby was an academic public administration figure, a Princeton University political scientist, skilled in practical public administration as a Department of Labor statistician, with experience on the governing board of Puerto Rico, in the US Bureau of Census, and as legal advisor to the Chinese government. Willoughby, according to Kahn, believed that government should run efficiently. He distrusted popular democracy and thought publicity like Allen’s of small importance, too technical. A more effective and realistic reform strategy, he believed, lay in concentrating on informing Congress as the people’s representative, than to address the people themselves.

The Bureau men had seen improved administration as a means to restore some measure of popular control over government and to address the dangers of a disaffected citizenry. Willoughby saw the public simply as a mass whose opinion might on occasion be aroused to support the institute’s independent goal of improving government administration. In Willoughby’s hands, the people became instruments of expert reform rather than its intended beneficiaries, Kahn argues.

F. THE 1921 ACT

The Budget and Accounting Act of 1921 (P. L. 67-13, 42 Stat. 20–27) created an executive budget process, the Bureau of the Budget, and the General Accounting Office. The budget became a set of “[e]stimates of the expenditures and appropriations necessary in his judgment for the support of the government for the ensuing fiscal year” (42 Stat., 20) transmitted to Congress on the first day of each regular session. The estimates included those on receipts for the ensuing fiscal year under current law and under the revenue proposals the president made. Also, the president included the “expenditures and receipts of the Government during the last completed fiscal year” as well as those estimated “during the fiscal year in progress” (42 Stat., 20). The president would also report to Congress on deficiencies in financing spending due to inadequate revenues or due to laws enacted after the transmission of the budget, including recommendations to Congress for new taxes, loans, or “other appropriate action to meet the estimated deficiency” (42 Stat., 21). The budget curtailed direct requests by agencies to members of Congress:

No estimate or request for an appropriation and no request for an increase in an item of any such estimate or request and no recommendation as to how the revenue needs of the government should be met, shall be submitted to Congress or any committee thereof by any officer or employee of any department or establishment, unless at the request of either House of Congress (42 Stat., 21–22).

The Act gave clear guidance on the nature of executive budgeting. The Bureau of the Budget in the Treasury Department (in the Reorganization Act of 1939, 1423 in the Executive Office of the President, renamed Office of Management and Budget in July 1970 Executive Order 11541), had clear authority as well. The top managers of the Bureau gained appointment by the president. Under rules the president prescribed, the Bureau staff “shall prepare for him the budget ... and any supplemental or deficiency estimates, and to this end shall have authority to assemble, correlate, revise, reduce, or increase the estimates of the several departments or establishments” (Budget and Accounting Act of 1921, 22). The Bureau had a constituency of one, the president. The Bureau gave the president the means to centralize budget control as well as to direct and manage agencies insofar as the budget could work instrumentally to gain management control.

Finally, the Act created the General Accounting Office (GAO, which in 2004 was renamed the Government Accountability Office). The Act made the office “independent of the executive departments and under the control and direction of the Comptroller General of the United States” (23). The Act located the office in the Treasury Department. However, the Act also moved the settlement of accounts, accounting and auditing to the Comptroller General from the Secretary of the Treasury and while giving the appointment of the Comptroller General to the President, provided for confirmation by the Senate and removal only by a joint resolution of Congress. Smithies (1955, 76) observes that Congress has regarded the General Accounting Office “as its own agency.... [and] has viewed its creation with jealous pride.”

Few if any have viewed with satisfaction the organizational arrangement given GAO. The ‘too much power, too little power’ problem lay in failing to distinguish between accounting and auditing as well as the proper functions of the president and Congress. Smithies explained:

The settlement of accounts can be regarded as exclusively an Executive function.... On the other hand, the Congress has a responsibility to review Executive performance and to do so it needs to prescribe the form [nature, and subject of the review. In giving the president the executive budget, the GAO section of the Act also] hampers Executive performance, reduces Executive responsibility, and gives the Congress more power than it requires to discharge its proper functions (1955, 76).

The two problems, who should account and who should audit, came out of Gladstone’s prime ministry in the “charter of the English financial system” (Wilmerding 1943, 252, footnote 9) and the Exchequer and Audit Departments Act of 1866. Wilmerding (1943, 252–253) noted that by 1921 the members of Congress had agreed with the reasons the English had long abandoned “complicated checks imposed before expenditure takes place.” The principle held that a “system of retrospective control” in the form of an audit, done independently of the president subject instead to Congress’ control, created a greater power over the purse and one that complemented the power of appropriation. Such a system had important support in the private sector, among advocates of the 1921 Act as well as among members of the president’s cabinet at the time (Wilmerding 1943).

The control emphasis in the 1921 Act did not give support to reform as much as a planning emphasis. Cleveland (1915) justified the budget idea as a plan, the lack of which had led to invisible, irresponsible government. Before, he said, estimates served the purpose of laying the foundation for work plans and financial plans that did not exist. Plans and thought about the responsibility for them marked the undeveloped idea of modern government. Centralized effort, he further argued, must bring together expenditure, revenue, and economic activity estimates so that someone can think in terms of the institution as a whole and the common good rather than the good of particularistic interests. The executive, the one actually implementing a plan, could be the only person held responsible for the success or failure of the plan. Therefore, the executive must exert leadership, Cleveland argued. Kaufman’s (1956) thinking suggests that besides strong executive leadership, the 1921 Act gave support to strengthened administrative expertise and political neutrality, and the Act weakened the idea of Congress’ representativeness relative to that of the president.

G. THE REFORM MOVEMENT AS INSTITUTIONALIZED VALUES

The reform movement represented many specialized movements, and the conflict among these movements and their constituencies resonates through subsequent events to reveal how institutions affect individual decisions. The movement created the institution of citizenship, and the movement changed the terms of debate about the appropriate size of the national and state governments in the federalist system as well as the hierarchy of status and representativeness among the three branches of national government.

Consider the Waldo (1948) study of the reform movement. The Progressive movement produced, through the National Municipal League and the New York Bureau of Municipal Research, the idea of a budget and a principle by which to unify all aspects of financial management. According to Waldo (1948, 32–33) the product was “efficient citizenship”:

1. Progressives grew sensitive to the appeals and promises of science, and put a simple trust in discovery of facts as the way of science and as a sufficient mode for solution of human problems.
2. Progressives accepted and even urged a new positive conception of government that resembled the idea of a planned and managed society.
3. The progressive reformers found in business organization and procedures an acceptable way to conduct the business of government, becoming evangelists for efficient administration of government.
4. They sensed that civic awareness and militancy, efficiency, and useful education would work to create an Efficient Citizenship movement.

Involved in this movement were three basic groups: positive government proponents usually called *progressives*, governmental research bureau professionals or the *analysts*, and *business interests* to which openness provided a way to check large increases in tax bills. The movement produced the principle that a well-informed citizenry, provided information through easily understood financial management procedures—line-itemized budgets, competitively bid purchases, and audited financial statements—could check the moves of detested politicians. Openness of government yielded a rudimentary medium through which action might follow. Efficiency stood as a scientific check on processes used in government, by providing a performance standard.

Openness became the great unifying principle that drew support and led to the coalition of interests supporting reform. The coalition that produced the reforms implementing efficient citizenship combined business interests, research movement principals, and positive government proponents. All of the goals were complementary only when the open government issue provided context. At other times, business favored restrained taxation. The researchers promoted the secular notion that “proper institutions and expert personnel” could create “good” government (Waldo 1948, 23). The positive government proponents sought to use government authority to provide services needed as a result of the demand for more roads and schools.

With restrained taxation, responsible procedures, and government leadership in economic and social development as fundamental positions of members of the original coalition, changes in the size of government could continually pull the coalition apart. In fact, the later developments integrating financial management derive from variations of these three goals: parsimony, efficiency, and equity.

The upshot of the Efficient Government movement efforts to add procedure to government administration for accountability sake led to the widespread institution of organizations for the purpose. The insistence on openness gave the institutionalizing movement momentum. The Budget and Accounting Act of 1921 became the major achievement. The Act created a budget office and an auditing agency, both of which would open government to scrutiny through publication of a unified budget. Unification and openness put the spotlight on the executive; all could follow the decisions

being made because they all took place in public view. Moreover, the other half of the Act's purview could check the implementation of these decisions: the expenditure audit.

The other members of the original coalition came off somewhat less well, even poorly. Researchers could look to the budget bureau and the accounting office as places where analysis might take hold. Greater faith in government decisions might come out of greater openness and might also lead to equity in vigorous government, a position of positive government proponents. Oddly enough, business interests, and parsimony, lost the biggest fight, that over the income tax when it was established just before the 1921 Act, and their share of the outcomes of the Efficient Citizenship movement was earned from the movement's acceptance of business operations as the standard to be observed.

H. COALITION CONVERGENCE AND DIVERGENCE

The leaders of the successive movements that have swayed thinking in public financial management shared one important belief—that openness in government's financial dealings served their own interests, whether they were efficiency, equity, or parsimony. Those interests might be very different—progressives wanted positive government, business interests low taxes, research bureaus analysis, and muckrakers punishment for thieves. However, the coalition built to pursue openness believed the basic currency of financial management to be procedures and routines that were able to be both observed and evaluated. Observable and able to be evaluated *for what* remained to be seen.

Openness was the currency among the members of the reform coalition. It united them all in opposition to what were referred to as political forces widely known as the political clubs that controlled local and often state government and which were themselves controlled by a political boss.

Openness was also the plateau to be reached before any of the beliefs of any of the reform coalition members could be realized. Positive government types had to have some measure of goodness and the data besides to determine equity, and to counter the effects of discrimination and less-than-ideal levels of political participation. Only openness could provide this measure and the necessary data. Analysts had to have openness to determine efficiency. Business interests had to have openness to pinpoint the threats to parsimony and the sources of inequity in their taxes. Muckrakers, finally, had to have openness to root out thievery.

Openness itself was not accountability. It was the necessary basis on which to build accountable systems of work. Accountability was the belief, the vision to be fulfilled, while openness was a way of employing technology and management to achieve the vision.

I. SYSTEMS OF ACCOUNTABILITY AS SOURCES OF DIVERGENCE

Reform coalition members held different beliefs, advocated different management systems, and advanced the use of different technologies, all of which implied different systems of accountability. If one considers muckraking as essentially the primary position of all members of the coalition, three major, sometimes overlapping, groups and systems of accountability are left: positive government types—more government as service needs expanded; analytical and research types—efficient government first and foremost; and pro-business types—low taxes for greater returns on investment in private enterprise. Consider Table 7.3 below and its portrayal of these systems.

Among the members of the group, differences existed over the *accountability premise*. Positive government advocates and pro-business interests tended to see needs outside the organization as having primary control over what the organization did; they saw responsibility in equity. This responsiveness to clients or taxpayers tended to outweigh the need for responsibility, especially that premised on the efficiency calculations esteemed by analyticals, and that premised on the parsimony arguments advanced by business interests.

TABLE 7.3
Comparison of Accountability Systems Implied by Reform Coalition Members in Government Financial Management

Group	Analyticals	Positive Government Believers ^a	Pro-Business
Accountability Premise	Efficiency	Equity	Parsimony
Technology	Productivity	Marginality	Monetized utility
Organization Theory	Hierarchical	Negotiated	Privatization
Belief System	Government as fixed sphere, neither expanding nor contracting necessarily	Government as expanding sphere	Government as contracting sphere

^a Waldo defines their views: “They accepted—they urged—the new positive conception of government, and verged upon the idea of a planned and managed society” (1948, 32); “they look favorably upon government, regard it as a desirable instrument for the accomplishment of individual and community purposes, profess indifference or express favor at proposal to extend the range of its operation or control” (1948, 68). Waldo subsequently cites Henry Bruere’s *New City Government* (1913) and Frederick A. Cleveland’s *Organized Democracy* (1913).

Source: From Waldo, D., *The Administrative State*, Ronald Press, New York, 1948; Schiesl, M. J., *The Politics of Efficiency: Municipal Administration and Reform in America, 1800–1920*, University of California Press, Berkeley, CA, 1977. With permission.

Technologies of analysis and decision making differed as well. Positives tended to compare programs with other programs, defining the best programs as those whose rates of return at the margin outweighed others. Efficiency as technology demanded a calculation of material inputs and outputs with effort taken to assure minimum loss in between. Typically, pro-business interests determined the worthiness of effort based on its perceived utility expressed in money terms and discounted for loss of value over time; the value of the preferred effort exceeded that of alternative ones.

Members of the coalition differed in their approach to the problems of management, in their *organization theories*. Positive government types wanted the goals and methods of organizations to be matters of cooperation reached through negotiation (Golembiewski 1977). Analyticals, from the Brownlow Committee on, tended towards hierarchy (Gulick and Urwick 1937). The pro-business interests favored private sector provision of most services that had before been produced by government (Wolf 1988).

Finally, the *belief systems* of the three elements of the reform coalition differed. Positive government types, by definition, believed in government as an expanding sphere of influence in direct proportion to the demand for public services. In contrast, pro-business interests lay in shrinking government’s sphere for the sake of both increasing business opportunity and decreasing taxes. Analyticals, however, tended to waffle on the size of government issue, emphasizing the efficiency issue whatever the sphere of government.

J. CONVERGENCE ON INSTITUTIONS THROUGH REORGANIZATION

The high point in reform took place after the 1921 Act in the first Hoover Commission. Gist (1998, 267) argues that after the 1921 Act, among reformers stress lay “almost exclusively [on] the themes of efficiency, centralization of administrative power, expertise, and the professionalization of administrators.” Expertise could check the power of politicians and gain the public interest (Keller, this volume).

The need for expertise rather than politics became evident as the US and then the world economy contracted during the period from 1929 to 1933. With efforts through government programs to deal with the consequences of the Great Depression, especially in the steady increase in government agencies, and president-centered reorganization and management study commissions that began in the 1930s, a consensus on institutions emerged. That consensus reasoned toward reforms to control the institutions that, in turn, control and apply technology, expertise, and knowledge.

Engineering institutions became a major effort. The first of these engineering efforts came with the work of John Maynard Keynes. In *The General Theory*, Keynes (1936, 378) reasoned “The State will have to exercise a guiding influence on the propensity to consume partly through its scheme of taxation, partly by fixing the rate of interest, and partly, perhaps, in other ways. . . . If the State is able to determine the aggregate amount of resources devoted to augmenting the instruments [of production] and the basic rate of reward to those who own them, [the State] will have accomplished all that is necessary” to achieve an optimum rate of investment, economic output, and full employment.

The second engineering effort came through the President’s Committee on Administrative Management or the Brownlow Committee. The reorganization efforts required study and a staff. The Committee staff did study and published the papers that became the essence of an engineering theory of institutions.

The *Papers on the Science of Administration* that emerged from the Brownlow Committee also continued in another form separation of administration and politics. Instruction comes in the last chapter (Gulick and Urwick 1937, 191–195):

Administration has to do with getting things done; with the accomplishment of defined objectives. The science of administration is thus the system of knowledge whereby men may understand relationships, predict results, and influence outcomes in any situation where men are organized at work together for a common purpose” (191).

It thus behooves the student of administration . . . to acquire the habit of separating (a) relationships and (b) value judgments as far as is possible in his work. . . . [The student of administration] should endeavor to say, ‘Under conditions x, y, and z conduct A will produce B; and conduct A’ will produce C.’ He may have discovered this because he feels that B is desirable and C is undesirable, but if another student, or a statesman, confronts the same problem he may none the less be able to build upon and make use of the scientific work of the first student even though he has a reversed scale of values. Whenever a student of government says: ‘The mayor should now do A,’ this is to be interpreted:

1. Present conditions are xyz
2. Under conditions xyz, A gives B
3. B is good, therefore
4. Do A

[If in the science of administration] the basic good is “efficiency” . . . we are in the end compelled to mitigate the pure concept of efficiency in the light of the value scale of politics and the social order (192–193).

The Papers immediately became a source for orthodox decision making (Miller 1991, 33–50). At about the same time, a more organic, textural explanation for administrative decision making emerged in the work by Chester Barnard.

1. Chester Barnard

Chester Barnard’s *Functions of the Executive* (1938) was significant as a bridge between the scientific management (Taylor 1911, 1947) and principles approaches and the groundbreaking

work of Herbert Simon (1947); in fact, Simon acknowledged his debt to Barnard in *Administrative Behavior*. Barnard's work has some of the strengths and weaknesses one might expect, taking into account that it is the work of a reflective practitioner attempting to explicate systematically his experiential knowledge and to integrate that experience with his informal studies in the social sciences. Barnard's writing is difficult; he never really delivers on his promise to describe in detail the actual functions of the executive, and he is occasionally inconsistent (e.g., his conflicting definitions of efficiency—first defined as being an absence of unanticipated outcomes from an activity, and only later defined as representing the equilibrium required for organizational maintenance). One might also take exception to his arguments in favor of informal executive organizations whose membership is based on uniformity of race, gender and religion: deliberately exclusionary elites. That said, one must be grateful for the fruit of Barnard's many years of keen observation of individuals and groups in actual organizations, his plainly deep and careful thought about those observations, and his humanizing ideal of executive leadership, particularly his emphasis on leadership by moral example.

One could speculate that Barnard did not seek to demolish scientific management, but only to put it in its place by articulating a range of criteria for deciding among means and ends beyond that of pure efficiency. His conception of organizational efficiency as an inducement/contribution equilibrium, after all, implicitly incorporates both the productive efficiency that was everything for Taylor and the allocative efficiency concept articulated in economic theory by Vilfredo Pareto. Rational productive efficiency is useful in helping to maximize the generation of surplus value, but cannot be an exclusive purpose in a complex organization based on systems of human cooperation. Perhaps most significantly, by introducing the allocative concepts of Pareto and other then-contemporary economists, Barnard thus offered a precedent for the application of microeconomic theory to the analysis of individual choices (that through aggregation form collective decisions and behaviors) in organizations. The literature on the economics of organization blossomed decades later, as discussed by Moe (1984), and continues to thrive. Barnard also adapted the then-recent development of indifference curve analysis to the internal economy of organizations as systems of cooperation. His concept of the "zone of indifference" (1968, 167) within which members of an organization are most easily influenced, because they are equally ready to accept any of the alternatives within the bounded set, formed the basis for Simon's (1947) later articulation of the "zone of acceptance," similarly grounded in a framework of viewing administrative organization as equilibrating the individual desires and contributions of its members.

K. MARY PARKER FOLLETT

Barnard's formulation of the economics of organization, with its reliance on a balance of inducements, shares with later rational choice-based models a presumption of relatively fixed rationality on the part of individual decisions makers. At about the same time budget and administrative reformers were remaking the federal government, however, Mary Parker Follett proposed an approach to organizations that was grounded in altering rather than accommodating individual judgments.

Widely cited in recent years as an underappreciated political and administrative thinker of the early twentieth century, Mary Parker Follett identified herself as a proponent of scientific management, but articulated a conception of the interaction of managerial with rank-and-file decisions that was considerably more nuanced than, and in some cases provided directly contrary solutions to, Frederick Taylor's attempts to prevent "soldiering" and other forms of inefficient behavior by subordinates. Her work illustrates a concern with making best use of the ways in which organizations' stakeholders form judgments about the world and about their own interests, and contrasts sharply in several ways with Taylor's ideal of supplanting the unscientific judgments and choices of non-managerial members. She went further, too, in anticipating stakeholder constructs of organization, by identifying consumers and other ostensibly external parties as

concerned with the results of organizational decision making. The core of her theory of human relations in administration can be found in four papers on "The Psychological Foundations of Business Administration," presented in January 1925 under the auspices of the Bureau of Personnel Administration (Follett 1940). Some of the ideas in these papers were articulated in earlier works, however, including the book *Creative Experience* (Follett 1924).

In "Constructive Conflict," Follett argued that because conflict or difference is inevitable in any organization, it ought to be put to advantageous use as much as possible. This could be accomplished, by seeking an "integration" of conflicting interests rather than simple domination or compromise, so that the conflict is exploited as a stimulus to the devising of new solutions rather than as a hindrance to resolution. Follett's integration would resolve conflict by devising solutions that respond to all parties' real interests. This requires bringing the differences causing a conflict into the open, focusing on the most significant rather than the most dramatic features of those differences to facilitate useful analysis of the problem at hand, and—by understanding the "circular" nature of human interactions—anticipating the responses of other parties and how those responses will in turn affect subsequent responses through the process of interpersonal "interpenetration." This approach to reconciling interests finds a more recent expression in the Harvard model of interest-based negotiation (Fisher and Ury 1983). In terms of our present analytic framework, it could be seen either as a way of incorporating multiple stakeholders' judgments and preferences into the premises each employs for preferential choice, or as a way of exploiting ambiguity by steering individuals' preferences in such a way as to yield compatible choices. In "The Giving of Orders," Follett asserted, "... orders will not take the place of training," and proposed that the most effective employees would be those who were induced to "work with" rather than "work under" organizational management, because this allows management and workers to reconcile the receipt of orders with the taking of responsibility and the ingrained "habit-patterns" and beliefs of the workers. This was to be accomplished by focusing on the requirements of the whole of a given situation to "depersonalize" the orders given, so that they clearly reflected the "law of the situation" rather than seeming to reflect only the arbitrary requirements of a supervisor. In this way, the organization could more readily secure what 50 years later would be termed "consummate" as opposed to "perfunctory" cooperation (Williamson 1975). Follett herself acknowledged that this required a faith in the possibility that calm, rational consideration would reveal common interests that might well be regarded as utopian. Again Follett emphasized the importance of understanding "circular behavior": the way in which the effect of the changing situation on the actors changes that situation and so on.

Responding to the increasing technical complexity and size of contemporary organizations, Follett (1940) emphasized the need to make all of the parts of an enterprise work together as a "functional whole," or "integrative unity." She asserted in "Business as an Integrative Unity" that the central responsibility of business administration was to integrate the interests of the range of its stakeholders, including owners, managers, workers, and customers. Making stakeholders see the ways in which all their interests can be simultaneously satisfied could allow the organization most effectively to make use of the abilities and knowledge of all its members. She noted too that in contemporary organizations the increased role of specialization and technical expertise had rendered the distinction between managers and the managed contingent at times unclear. In contrast with Taylor, then, Follett here suggested that managerial elites themselves could or should find themselves relying on the judgments of people with a more hands-on form of knowledge. This too may have been somewhat utopian, judging by some recent evidence about the use of production workers' knowledge (Schmidt 1993). In "Power," Follett advocated seeking a co-active "power-with" rather than a coercive "power-over" within an organization or society. She argued here in favor of the careful and thoughtful integration of multiple viewpoints through circular behavior and the interpenetration of ideas, together with submission to the law of the situation and the creation of the desired "functional unity" within an organization. The use of indisputable facts ascertained through scientific methods of inquiry can build up power-with and so reduce the scope for adversarial bargaining and power-over. This is meant to create an environment in which all members of

the organization gain power together, through active cooperation and participation rather than mere consent or acquiescence. Here are echoes of scientific management's search for the one best way, but Follett proposes to rely on a variety of stakeholders' judgments to identify the one best choice for any situation. Again, there is also a possibility that this exploits ambiguity by providing opportunities for actors to understand their own preferences in more compatible ways.

Taken as a whole, Follett's work in administration and her earlier work in political theory (Follett 1918) revealed a combination of normative commitment to popular self-government and confidence in the possibility for science to find win-win solutions to conflicts that in some ways anticipated the development of the policy sciences several decades later. Allowing for the open discussion of interests among the full range of those holding stakes in the outcomes of decisions (although she does not employ the term stakeholder) and the application of scientific models of problem solving might identify ways in which mutually advantageous decisions could be achieved without coercion—although not without conflict. The potential in her proposals for taking advantage of ambiguity to reconfigure individuals' judgments and choices prefigures in some ways McGregor's Theory Y (1960).

VI. WORLD WAR II TO THE END OF THE TWENTIETH CENTURY

Over the first half of the twentieth century, the development of systematic, executive-centered budgeting; the New Deal and its dramatic expansion of positive, activist government; and the growth of technical approaches to organizational management and decision making transformed the landscape of public policy and public administration. By the 1940s, it had become clear that as a result of these parallel trends, "Public administration is policy-making" (Appleby 1949, 169). Bureaucrats and technical experts had come to be a new elite, making policy from within the executive branch as well as implementing it. Paul Appleby argued that it is not possible to separate policy from administration, and that the separation of powers itself is not impermeable. Administrators make rules for the future, thus performing a legislative function, and interpret rules in the present, thus performing a judicial function. They also shape policy by making specific recommendations for legislation. At the same time, Congress intervenes in administration in a number of ways. While there is a continuum from policy to administration, the questions of "what to do" and "how to do it" are at all times intertwined, according to Appleby, and it is also possible for large policy changes to occur administratively. The politics-administration dichotomy, with its reservation of collective choice- and constitutional-level decision making for citizens and their elected representatives, is descriptively inadequate in the era of big, activist governments, whatever one may think of it as an inspirational ideal or as a formerly accurate description of limited government. The role of technical elites can no longer be confined to purely operational decisions.

A. THE DICHOTOMY UPDATED: THE FRIEDRICH-FINER DEBATE

The famous Friedrich-Finer debate framed the implications of this emerging expert, administrative elite in terms of the problem of administrative discretion and its implications for institutional arrangements. Friedrich (1940) argued in favor of expanded discretion for executive-branch bureaucrats, asserting that the increasing scope and complexity of modern government together with legislative delegation militated in favor of increasing reliance on expertise and professional norms. This, according to Friedrich, would achieve greater responsiveness of government to the actual needs of the public. Finer (1941) objected, arguing that traditional legal, political, and hierarchical standards, with their established mechanisms for sanctions, still needed to be pre-eminent. Administrators are rightly the agents of the citizenry and their elected representatives. As such, it is their responsibility to carry out the expressed wishes of those principals, not to decide on their own what is best for the public. The legislative delegation that can occur in the face of technical complexity or irreconcilable political conflict, he argued, could and should be remedied

by greater specificity. The judgments and preferred choices of experts must be subordinated to the wants—as distinguished from the needs identified by experts—of the people. The solution is not for the principals' roles of citizens and legislators to be usurped by administrators' specialized expertise, but rather to provide technical support that will enable non-specialists to evaluate the claims of technical elites.

The question of how much and what kind of discretion to grant administrators over decisions at all three levels remains an unresolved one, and an often unacknowledged problem in the schemes of reformers. For instance, Theodore Lowi argued that members of the Public Choice school, although normatively committed to limited government and the consumer sovereignty of the citizen, also favored technical expertise over representative democracy in the formulation of collective choices, abhorring as they did the “irrational inefficiency of politics” as a way to make decisions (Lowi and Simon 1992). The New Public Administration and the more recent reinventing government and New Public Management models of reform similarly have espoused in varying ways active roles for administrators in making discretionary decisions based on their own judgment and expertise at the same time as they avowed a commitment to serving the public—whether as citizens or customers— better.

B. EFFORTS TO ENHANCE RATIONALITY

The Friedrich–Finer debate and its continuations concern the appropriate locus of discretionary authority and the allocation by institutional arrangements of the authority to propose normative judgments and adopt preferential choices. The 1940s also saw the publication by Herbert Simon of a self-consciously revolutionary approach to understanding the interaction of individual and administrative rationality, Management Science, and the early stirrings of an attempt to eliminate the need for normative conflict in policy rationality, the Policy Sciences or Policy Analysis. Each approach held out hope for making its side of the politics–administration division more scientific and so more efficient, by replacing imprecise logics of appropriateness, such as that represented by the “principles of administration” Simon (1947, 1997) demolished in his second chapter, with more calculative logics grounded in the specification of ends and the discernment of the best means to those ends.

1. The Roots of Management Science: *Administrative Behavior*

Herbert Simon, for his part, proclaimed that decision was at the heart of administration and suggested that the politics–administration dichotomy be reconceived, but without abandoning the notion that the legitimate provinces of administrative and political decision could be distinguished. Instead of an abrupt dichotomy, a continuum extending from the purely factual to the purely ethical can be seen as a basis for sorting the experts' and popular representatives' realms of decision. The role of administrators is to arrange to realize the values selected in political institutions and to provide legislators with the information on which political judgments and choices can be based, and the role of administrative institutions in turn is to guide the choices of individual administrators and to perfect their judgments to facilitate both the implementing and informing functions of administration. Although his full explication of the problem of bounded rationality and the satisficing model of decision—limited search for alternatives and the adoption of a simple level of aspiration as a target rather than optimality or maximization—was still in the future, by the time of his doctoral dissertation, published as *Administrative Behavior* (1947, 1997), the outlines were visible. Organizations, Simon suggested, serve to steer the choices of rank-and-file organizational members toward the most appropriate of the possibilities within the “zones of acceptance” constituted by their inherent knowledge, skills, abilities, and predilections. That is, they simplify decision making for individuals by reducing the number of alternative judgments and choices organizational members must evaluate to do their work. Administrative organizations also serve to enhance the rationality of strategic and

tactical decisions made by individuals on behalf of the public by providing systematic supports to extend individual, bounded rationality so that it might more closely approximate synoptic or complete rationality aimed at optimal choices. The human mind and attention are among the scarcest of all resources (Simon 1978), so that even considering uncertainty alone as a challenge to decision (the reliance on extra-administrative political value judgments as the sole source of policy direction served here to simplify problems of administrative decision by essentially leaving major sources of ambiguity outside the model), fully rational decisions by unaided individuals are improbable at best. Even operational decisions tend to be so complex that organizational supports for rationality are required if one hopes to approximate complete rationality.

This reliance on organizational or managerial direction of individual workers' behavioral choices and on technical expertise and administrative organization to structure the managers' judgments and choices threatened to bump up against the challenge that "The central problem of democratic administrative theory ... is how to reconcile the desire for democracy ... with the demands of authority" (Waldo 1952, 102). Indeed, according to Waldo, self-conscious public administration shared a core set of values with private, business administration, and "the theory and practice of private administration were shaped in a context that was in very important respects undemocratic" (83).

To reduce the difficulty involved in reconciling democracy and administrative hierarchy, Simon strategically simplified the second-order analytic tasks entailed in making administrative decisions and improving the processes by which those decisions are made. He carefully bounded the scope of administrative decision treated by his work to exclude the policy, ideological, and partisan political decisions for which democracy—rather than analysis by or obedience to technical and administrative elites—was the normatively desired mode of decision making. Managerial elites could govern operational decision making, but would reserve to the citizenry as much as possible decisions at the collective-choice level—the selection of the political values in the service of which administrators would seek the instrumental value of efficiency. This would be accomplished partly as a result of institutional divisions between the realms of policy and administration and partly through their own efforts not to overstep the bounds of an intention to maintain an approximation of dichotomy. If it is true that administrative decisions bear consequences for policy, it is also true that scrupulous administrators can attempt to uphold rather than undermine policy decisions to the extent those decisions are relatively certain and unambiguous. Even so, Simon acknowledged, "In practice, the separation between the ethical [deeming states of the world "good" or not] and factual ["true" or "false"] elements in judgment can usually be carried only a short distance" (61).

Simon would continue to pursue a better understanding of actual human instrumental rationality and the ways in which it could be enhanced by and within administrative organization, including exploration of decision-support techniques, expert systems, and other aids to judgment and choice. Still, his focus on administrative choice in the context of an aspiration to maintain some form of distinction between the acts of selecting authoritative values and of getting things done implied an acceptance of partisan politics and other messy and likely inefficient means of generating public decisions at the constitutional and collective-choice levels. Decades later, Simon claimed the mantle of the Framers for his own insights, remarking that his works "proclaim a very limited form of human rationality ... that acknowledges the whole person: values, emotions, stupidities, ignorance, and all. Madison, Hamilton, and Jay would have had no difficulty seeing in the administrator of *Administrative Behavior* the same *homo politicus* that they described in the pages of *The Federalist* (Lowi and Simon 1992, 111).

2. Policy Analysis and Its Discontents

The same post-World War Two period, however, also saw the emergence of a technocratic approach that, with the best of intentions, hoped to render inefficient and contestable political means of policy decision obsolete by substituting scrupulous techniques of scientific policy analysis

that could help legislative and executive decision makers select objectively correct policies. The policy sciences were to be objective but also unabashedly normative, placing technical specialists from a range of disciplines in the role of intermediaries to democratic policy decisions, with the responsibility of “locating data and providing interpretations that are relevant to the policy problems of a given period” (Lasswell 1951). In the context of the continuing expansion in the size and scope of the federal government occasioned by the war, a problem-solving model placed government at the center of collective life, with a responsibility to identify and solve collective problems, with few limits other than those imposed by fiscal constraints. By systematizing value-based judgments and choices according to a rigorous logic of social efficiency, policy analysis appeared to some advocates to be a way to render politics and ideology less important than technical analysis in identifying and solving those policy problems and to overcome the limitations of individual and political rationality through science. Many of the analytic techniques of policy analysis had their origins in the decision sciences developed during the war, particularly operations research, adapting to matters of selecting public ends and the means thereto the problem-solving orientation used to support military logistics (DeLeon 1988). Economic theories and techniques of analysis formed another core set of procedures for conventional policy-analytic procedures of judgment and choice, amounting to what Lowi would later describe as “the new language of the state” (Lowi and Simon 1992). Lowi’s critique suggested that rather than serving as public-empowering intermediaries, policy analysts had instead become a technical elite whose judgments and recommended choices dominated even those of the political elite comprising the public’s elected representatives:

When the key elements of a policy problem have been defined tightly in economic terms, and when the proposal comes supported with elaborate methodology, such as cost/benefit analysis, legislators find themselves voting Yes or No on whether the costs outweigh the benefits [rather than setting the terms of the policy debate themselves] (108).

Hecló’s (1978) naming and analysis of the “issue networks” that by the late 1970s had come to share policy space with and even in some areas supplant the older “iron triangles” consisting of bureaucrats, congressional committees, and special-interest representatives, revealed another aspect of the inadvertently elitist implications of specialized policy analysis. Hecló argued further from the example of the Carter administration that issue-network membership rather than traditional political and ideological affiliations had come to be the requisites for appointment to key federal political-administration positions. For Hecló, the very real benefits of this arrangement—it mirrored the general public’s decreasing alignment with political parties, linked Congress and the executive in new and useful ways through shared understandings and vocabularies, and allowed for greater maneuverability by public managers—were not quite sufficient to dismiss the disadvantages. Those disadvantages included the loss of democratic legitimacy through too much complexity, too little consensus, too little evident self-confidence in prescriptions, and no closure to policy problems (in large part consequences of the academic orientation of the networks and their members who now fill the appointive posts); the diminution of the president’s political leadership, and potentially severe problems of “the accountability of a political technocracy” (122). Hecló’s issue networks are in fact a form of institution, helping their members know what is important and true, and defining their interests in specific ways (Scott 1994, 1995). “Network members reinforce each other’s sense of issues as their interests, rather than (as standard political or economic models would have it) interests defining positions on issues” (Hecló 1978, 102). “Sharing policy knowledge, the networks provide a minimum common framework for political debate and decision in the two branches... Like experienced party politicians of earlier times, policy politicians in the knowledge networks may not agree; but they understand each other’s way of looking at the world and arguing about policy choices” (117). While the parallel is not exact, to some extent this echoes the concern expressed by Waldo (1984) that administrators in a large and

activist public sector tend by default to construct a particular political philosophy grounded in precepts of efficiency, possibly at the expense of other societal values and goals that might otherwise be identified and pursued in a democracy. The 1980s, however, saw an appreciable increase in the degree of partisanship of expert analysis applied to policy problems, so that some degree of ideological competition of ideas began to occur in and around policy networks, moving the system at least to some degree from elite consensus toward a real competition of ideas (Fischer 1993).

C. THE GREAT INCREMENTALISM DEBATE

Another critique of the policy analytic model, or at least of a straw-man version of the policy sciences, was presented by Charles Lindblom in the form of a defense of the more traditional “muddling through” model of administrative decision making (Lindblom 1959). In the traditions of both Plato’s *Republic* and neoclassical economics, Lindblom generalized from a descriptive portrayal of the decision making procedures employed by individual public administrators, first to a similarly patterned depiction of collective decision practices and then to a claim that “incrementalism” was both accurate description and reasonable prescription for collective decisions, employing marginal reasoning, and continuous incremental adjustments of policy based on learning from previous adjustments. Rather than attempt, and fail, to identify global values, corresponding policy ends, and optimal means thereto—a model of what would later be termed synoptic rationality—actual political and administrative decision makers tended to mix ends and means, limit the scope of values and alternatives included in the analysis, and conduct policy as a series of small and easily amplified or corrected experiments. This was not only how it was, but also as it should be, given the practical limitations on individual and collective analytic capabilities and the incommensurability of many social values. In the face of what might be termed uncertainty and ambiguity, incremental analysis and change, and the “mutual adjustment” of competing interests and ideas, made it possible for actors to reach agreement and to continue pursuing policies with favorable results while changing course before undesirable results accumulated to an unacceptable degree if policy changes proved to have undesired results.

Weighing in several years later on what had by then become a voluminous and contentious literature debating the descriptive and prescriptive validity of incremental versus synoptic rationality, at both the individual and collective levels of analysis, Amitai Etzioni (1967) proposed to resolve the debate by suggesting in effect, “all of the above,” with his “mixed-scanning” model of collective decision. “Mixed-scanning provides both a realistic description of the strategy used by actors in a large variety of fields and the strategy for effective actors to follow” (388–389). Etzioni argued that actual individual approaches to decision do, and processes of collective decision making ought to, combine relatively comprehensive but not highly detailed “scanning” of a broad range of values, means, and ends to “set basic directions” with “incremental processes which prepare for fundamental decisions and work them out after they have been reached” (388). Further, Etzioni claimed, “Incrementalism was shown to overlook opportunities for significant innovations” (1986, 8). This effectively presumed the desirability of a “more active approach” to the selections of values and policies and the possibility that such a more active approach could improve on incremental models by establishing a larger perspective and encouraging decision makers consciously and strategically to allocate attention and analytic resources between comprehensive and incremental analyses. Implicitly echoing Keynes’s interventionist dictum that “in the long run (over which incremental adjustments through market mechanisms achieve optimal results), we’re all dead,” Etzioni further suggested that a mixed approach could reach preferred states more efficiently than purely incremental models, in part by working to specify actively desired states rather than just reacting to problems. “Often what from an incremental viewpoint is a step away from the goal (‘worsening’) may from a broader perspective be a step in the right direction” (1967, 389).

Two decades after his initial exposition, Lindblom (1979) clarified and elaborated upon his notion of incrementalism, identifying four related aspects of incrementalism and articulating its relationship with pluralist models of political decision. Political incrementalism—"political change in small steps," not to be confused with pluralism and its reliance on partisan mutual adjustment for the reconciliation of conflicts of ideology and interests—is distinct from incrementalism as an approach to policy analysis. As an analytic approach, incrementalism encompasses "simple incremental analysis," which considers as alternatives only incremental changes from current conditions, "disjointed incrementalism," which employs "a mutually supporting set of simplifying and focusing stratagems" including the "fragmentation of analytical work to many (partisan) participants," and "strategic analysis" (517–518). Analytic incrementalism and pluralism are not ideal procedures for collective decision, Lindblom argued, but they are better than the realistically available alternatives such as totalitarian centralized decision and/or inevitably failed attempts at comprehensive scientific rationality. Further, they could be improved through the application of "strategic analysis," the systematic and conscious simplification of problems in order to achieve a collective version of individuals' bounded rationality through "skillful incompleteness" (524). Lindblom concluded this article by promising to develop further inquiry into the use of knowledge and analysis in social problem solving, beginning with *Usable Knowledge* (Lindblom and Cohen, 1979).

Lindblom and Cohen's book was prompted by their "dissatisfaction with social science and social research as instruments of social problem solving." Where Hecló (1978) expressed concern about the loss of democratic legitimacy associated with an essentially academic approach to solving policy problems, Lindblom and Cohen pointed out that there were fundamental problems of usefulness as well. Professional social inquiry (PSI), they argued, was useful only insofar as it was integrated into a larger process that also included ordinary knowledge, social learning, and interactive problem solving of which political bargaining is one variety. Such an approach would accept PSI as an increment of knowledge but not one that is distinctively authoritative, and would not necessarily privilege understanding above simply arriving at agreed and agreeable solutions to problems: "agreement is the test of 'best' policy" (Lindblom 1959, 84).

By 1990, however, Lindblom's continuing investigations appeared to have rendered him somewhat more pessimistic about the use of scientific techniques to guide collective policy decisions. In effect, he argued in *Inquiry and Change* (1990) that society has serious problems of impairment in its collective ability to learn that cannot be solved merely through improvements in professional scientific inquiry. Elite models of decision making were no less subject to inconclusiveness of judgment than lay probing by non-specialists and in fact were likely to contribute to greater "impairment" of social problem-solving abilities.

These critiques of synoptic rationality as realistically descriptive of individual decision making (Simon 1959, 1997) or usefully prescriptive for collective decision making (Lindblom 1959, 1979; Lindblom and Cohen 1979) suggested that sequential and bounded models of rationality were more realistic both as description and prescription. Limited search and satisficing, and incremental choices allowing for redirection without excessive disruption, can be seen as responding to the ambiguity associated with the endogenous and emergent qualities of individual and collective preferences as well as to the uncertainty associated with the constrained rationality of both scientific and ordinary knowledge.

Processes of interaction and mutual adjustment facilitate the discovery of values and of what one might call social zones of acceptance as an alternative to the central specification, or worse, the taking for granted, of values, ends, and means thereto in an effort to seek rationality in spite of politics (Waldo 1984). But this in turn requires significant improvements in the capacities of both practitioners of PSI and ordinary citizens, involving significant changes in power relations as well as expertise and factual knowledge (Lindblom 1990). By 1990 in fact, Lindblom was fairly explicitly advocating some approximation of radically egalitarian direct democracy, of better informed lay citizens, as a means to reducing the present impairment of social decision making

by establishing a genuine competition of ideas. In light of the chicken-and-egg problem of “mutual interaction between improvements in inquiry and improvements in social structure” (287), this would require addressing problems of inequality and propaganda as well as the centralizing tendencies of the policy sciences and the Progressive-era legacy in public administration (also see Schneider and Ingram 1997). Interestingly, Lindblom’s (1990) work offered a program for social learning and problem-solving with marked similarities to Fay’s (1976) call for a critical social science, albeit without the explicit focus on bettering the circumstances of traditionally repressed groups in particular.

D. FORMS OF INDIVIDUAL AND COLLECTIVE IRRATIONALITY

The period from the 1960s to date has seen a wide range of work produced exploring individual and collective rationality, or irrationality, in decision making. Scholars of organizations attended to some of the ways in which actual organizations failed to produce collective decisions that improved on individual bounded rationality in the way that Herbert Simon’s work suggested would be desirable. Actual collective decision making, in organizations and in politics, it seemed, diverged from the idealized rational model of problem identification and goal setting, comprehensive identification and analysis of alternatives, and optimal choice, at least as much as Simon’s boundedly rational individuals—or even more so, to the extent that collectives may fail even to satisfice by working toward an initially stipulated objective or objectives. Public-choice economists and political scientists identified a number of theoretical grounds for predicting that representative democracies might readily transform individual rationality into irrational and inefficient collective decisions. As if that were not bad enough, psychologists identified a number of ways in which individual judgments tend to be biased, or simply incorrect, to an extent that results in distinctly irrational choices at the individual level as well.

1. Organizational Decision Making

In the fourth century BC, Plato famously presented the psychological makeup of individuals as a suitable analogy for the ideal structure of political collectives (Plato 1979). The three competing parts of an individual mind—appetite, reason, and passion—were paralleled by three proposed classes to discharge the basic social functions of production, reasoning and governing, and implementing governance—craftsmen, rulers, and auxiliaries in Cornford’s translation. In both the individual and the *polis*, Socrates and his interlocutors agreed, it was best for reason to rule, so that a well-governed person or state could be expected to behave rationally rather than responding merely to appetites and passions.

Two millennia later, Allison (1971) pointed out that—unlike Plato, who offered his unified, rational-state conception as an ideal at odds with the actual Athens of his day—observers of organizations fell into a trap of mistakenly assuming that organizations would inevitably act rationally and with unity of direction. Allison concluded from his examination of the Cuban missile crisis that the assumption by foreign-policy officials and analysts that governments could be understood to decide to behave as monolithic, self-interestedly rational actors led them to misinterpret actions and so misunderstand situations and their risks. “The ‘maker’ of government policy is not one calculating decision maker but is rather a conglomerate of large organizations and political actors” (3). Allison proposed two alternative ways of understanding how organizational decisions were made, each of which, he argued, could better account for actual responses and decisions than the black-box rational-actor presumption.

Essence of Decision (Allison 1971; and see subsequent commentary and updates by Allyn et al. 1989) examined the mechanisms of political-administrative formulation of government policy and responses to events, through an examination of the Cuban Missile Crisis of October 1962. Allison contrasted three alternative models of organizational decision making. Model I, the classical

rational-actor model, presumes that governments' and agencies' decisions can be understood as responding rationally to circumstances to maximize some value or set of objectives, just as *homo economicus* is presumed to decide and act. This model takes into account uncertainty as a problem at the organizational level, but not ambiguity, and logics of consequences are presumed to dominate. Model II, the organizational-process model, depicts organizational decision as governed largely by routines and standard operating procedures of the component units that make up a government best depicted as a "conglomerate of semi-feudal loosely allied organizations" (67), such as the Navy, the State Department, and various sub-units within them. Model II is grounded extensively in the work of Chester Barnard (1938) and the Management Science researchers of the so-called Carnegie School (Cyert and March 1963; March and Simon 1958; Simon 1997) and depicts organizational behavior as composed in significant part of the sum of numerous, loosely coordinated incremental decisions by sub-organizations. Here, logics of appropriateness are important determinants of choice, and organizational judgments are subject to considerable ambiguity. Allison's Model III, the governmental politics model, focused on bargaining and power within governments among elected officials, appointees, and administrators, and borrowed some of Lindblom's (1959) argument that agreement on a course of action is a central criterion for assessing the merits of a policy. Model III also relies on Neustadt's (1960) examination of federal executive authority, and Almond's (1950) application of political pluralist analysis to foreign policy with its attention to the interactions and competition among general and attentive publics, policy and opinion elites, and official policy leadership. Here, even if individual members of the organization are invariant in their normative judgments and preferences, ambiguity exists at the organizational level.

Models II and III helped to explain the behavior of both the US and Soviet governments during the crisis in ways that Model I could not. On the other hand, they also required much more information to be collected and analyzed: at the time he wrote his book, Allison was unable to collect enough information about the Soviets to perform an effective analysis of their behavior using Model III. Understanding the practical implications of constrained organizational rationality to predict behavior in actual policy settings ironically requires more extensive rationality and analytic capacity than simply treating organizations as if they were monolithically, strategically rational. Organizational inertia, challenges of communication, parochial interests within organizations, and the use of informal channels and forums for decision making all undermine the rationality of governments as decision making entities. Allison concluded by calling for greater attention in policy analysis to implementation, bureaucratic politics, and administrative feasibility.

Also emphasizing the complexity and non-linearity of decision making processes was the garbage-can model of decision and the theories of agenda-setting and policy formation that descended from it. In its initial formulation, this model took the example of decision processes in universities, an example of *organized anarchies*, "organizations characterized by problematic preferences, unclear technology, and fluid participation," to "suggest that such organizations can be viewed for some purposes as collections of choices looking for problems, issues and feelings looking for decision situations in which they might be aired, solutions looking for issues to which they might be an answer, and decision makers looking for work" (Cohen et al. 1972, 1). As Cohen, March, and Olsen noted, the three properties that characterize organized anarchies are common in public as well as educational organizations. They suggested that in such organizations, traditional theories of management control and coordination were less useful, because they typically assumed firmer knowledge of goals and technologies, and more dependable engagement of organizational members, than exist in organized anarchies. Choice opportunities, the recurrent "occasions when the organization is expected to produce behavior that can be called a decision" (3), can be viewed as garbage cans into which people toss problems and solutions as they arise. Thus the flow volume and timing of the streams of attentive people, problems, and solutions, and the access of particular solutions and problems to choice opportunities, can be expected to influence decisions. Garbage cans are not necessarily a consistently effective means for solving particularly

identified problems in a structured, instrumental fashion—in fact they often result in a choice being made before a problem has reached the choice opportunity (by oversight) or after it has left it (by flight)—but they do allow decisions to be made and problems dealt with even when the organization is plagued with goal ambiguity and conflict, with poorly understood problems that wander in and out of the system, with a variable environment, and with decisions makers who may have other things on their minds (16). In short, although Cohen, March, and Olsen did not press normative claims for the superiority of the form of decision making they described and modeled in this work, the garbage can does allow for decisions to be made and problems to be dispensed with in complex environments characterized by pervasive ambiguity and uncertainty that may stymie more structured and strategic models of problem solving and analysis.

2. Multiple Streams in Policy Making

Whereas the initial formulation of the garbage-can model generated a computer model and a series of hypotheses, Kingdon (1984) applied the model to a conceptually elegant and empirically rich descriptive/explanatory analysis of the selection and matching of policy problems and solutions in the US federal government. Kingdon modeled the policy process as broadly divisible into agenda-setting, alternative-specification, policy-choice, and implementation components. His focus was on how the attention of decision makers came to be focused on particular issues, and how issues and solutions did, or did not, move from the “specialized” agendas of particular issue networks and interests, to the “governmental” agendas of recognized public concerns, and finally to the “decision” agendas from which particular policies are adopted, or aborted, by mating issues, solutions, and politics. Kingdon framed his question as “How does an idea’s time come?” Incremental models, he argued, were more accurate as descriptions of the federal policy process than models presuming comprehensive rationality and systematic, top-down analysis. Ideas for policies, he observed, can come from a variety of sources, such as interest groups, the media, elected officials, bureaucrats, academics and other professional researchers, and generalized public opinion, with no particular set of participants consistently leading with their ideas. In fact, he argued, the garbage-can model was more apt descriptively for characterizing the diverse origins and development of policies in a fragmented government with its diffuse and complex flows of information.

Kingdon operationalized the issues–solutions–people–garbage cans model by specifying three distinct and partially independent processes, the fortuitous combinations of which into “policy windows” he hypothesized to yield policy change or action: problem recognition, policy formulation, and electoral politics. Problems are constructed by normatively redefining observed conditions, so that a given condition may be viewed as any number of problems or as completely unproblematic for different observers and at different times. Crises and disasters help to focus attention, and the ability to quantify or explicitly model a problem can be a significant factor. In keeping with the original formulation of the garbage-can model, problems can go away even if they are not solved, including through inattention or calculated neglect (if, for instance, the expected costs of solving a defined problem seem unacceptable). Policies emerge from the “primeval soup” of ideas floating around in policy communities of content-area specialists. Among the participants in policy communities are policy entrepreneurs who assume the role of advocates for particular policy solutions and actively seek problems to which those solutions may be attached. Policies are more likely to emerge from the soup and rise to the public decision agenda if they are matched with problems and so “ready to go,” and value acceptability within the policy community is among the other criteria for survival. The political stream involves electoral and legislative politics, with competition among jurisdictions and among branches of government, bargaining and logrolling, and the play of perceived public moods and organized lobbying all influencing the setting of the agenda for policy adoption.

Kingdon cited an informant's analogy of surfers gathered waiting for a big wave to ride in describing the policy windows that briefly present policy entrepreneurs and other attentive participants with opportunities to join the three streams to move bundles of problems and solutions onto the decision agenda. Windows are amenable to being opened up when changes occur in the political stream, such as perceptions of urgency or the turnover of political actors, and can occur fortuitously, such as in response to a natural disaster, or predictably as a result of elections or the routine budget cycle. They close when participants feel they have resolved a problem, or that they cannot get action on a policy, or when events or personnel change again before action is taken. Limits of time and of individual and systemic attention are important and not always predictable factors in the outcome of a window's opening. One of the ways in which action can fail to be achieved during a window's opening is if too many solutions get stuffed into the same window, and the "entire complex of issues falls of its own weight" before issues and solutions can be joined together (185).

Returning to his larger model of the overall policy process, Kingdon concluded that the agenda-setting sub-process is driven primarily by (a) the emergence of problems, (b) the course of politics, and (c) the activities of the process's visible participants—elected officials and their key appointees, the media, and the political parties. Alternative specification is more the work of the hidden participants—policy communities of issue-area specialists, such as bureaucrats, analysts, Congressional staffers, consultants, and professional researchers—who generate and evaluate the solutions in the evolving primeval soup of the policy stream. Once a window opens, it becomes possible for policy entrepreneurs to promote the joining of problems and politics from the governmental agenda with policies, to move a bundle composed from all three streams onto the decision agenda for action, or rejection. Throughout the process, Kingdon is clear, alternatives precede agendas: the normative model of strategic problem selection and solution is not adhered to in practice. On balance, Kingdon's research indicated that the central active participants in the policy process are members of a variety of elites, political, professional, and to some extent economic. The general public plays a role primarily insofar as elected officials and others are alert to shifts in the public mood or attention, so that matter of deciding what public problems are to be solved and by what means is one that involves only indirect involvement by non-specialists and depends in large measure upon the solutions advanced by specialists. Kingdon's multiple-streams model of agenda setting has been examined and formalized by Zahariadis (1999), who concluded that "ambiguity is a fact of policy making" (89) that presents both costs and benefits for policy design/choice. Ambiguity (Zahariadis cites March 1978) renders the importance, meaning, and value of solutions and problems difficult to ascertain precisely and invariantly. Thus, "Choice becomes less an exercise in solving problems and more an attempt to make sense of a partially comprehensible world" (Weick 1979, 175) (75). Further, Zahariadis suggested, there are very real advantages to policy makers of selecting solutions first, rather than attempting to solve problems directly (83). Zahariadis also provided in this chapter an extensive review of policy literature grounded in Kingdon's model, and proposed a policy-research agenda centered on three questions: (1) how is the attention of policymakers rationed; (2) how are issues framed; and (3) how and where is the search for solutions and problems conducted?

3. Framing

Questions about the dominance of either institutions or individuals in decision making can consider the power of either to limit the other, the impact separation of powers and federalism have on the balance between the two, and the implicit view of each of the other. First, institutions emerge as a result of the careful cultivation of a frame of reference toward society (Schön and Rein 1994). For example, Schön and Rein (1994, 129–161) discuss the problem of homelessness in Massachusetts in the 1980s and contrast the frames brought to the problem—market, social welfare, and social control by different staff members from state departments asked by the governor to pool expertise and help solve the problem. An institution's frame of reference deliberately excludes many other

frames, asserting primacy for a frame that accords with the institution's history, member training and socialization, and the expectations of society (White 1951, 1954, 1958, 1978; Krasner 1988; March and Olsen 1984; Kaufman 1969; Scott 2001, 58–61). The frame of reference may have developed as individuals shaped institutions with policy choices, but the continuing influence of those first choices have a large, perhaps decisive impact on future choices (Skocpol 1992; King 1995; Krasner 1988). Future choices include the alternatives considered by individuals. Schattschneider (1960, 66, 102) understood that a person, party, or institution that dominates choice alternatives dominates the entire decision making process. Institutions, it is argued, dominate individual decisions.

4. Public Choice Theory and the Irrationality of Politics

One institution that dominates individual decisions is the requirement of some degree of consensus for collective choice (Miller and Robbins 2004). The degree of consensus and process for obtaining it characterize fundamental rules of US governance and decision making. Consider the theory. Voting analysis demands that individuals' preferences toward a project be known. Obviously, 100% voting participation resulting in a consensus decision on a matter would guide decision makers or provide evidence of a valid decision. The first variable in voting analysis, therefore, is the probability of violating validity as the vote allowed for decisions departs from unanimity. Such a problem occurs in sampling as well as in choosing majority rule over consensus.

Gaining unanimity has drawbacks, not the least of which is the cost entailed in cajoling participation and informing voting. The counterbalance to total participation and consensus is the cost that both would entail. The closer to total participation and consensus in voting, the higher the cost of the voting process. The lower the cost of the voting process, the less likely decision making has any validity. That is, the majority of votes of the number of voters may not be valid expressions of the preferences of the total population even though such an election may cost less than any methods that could be used to secure unanimity.

The appropriate system of voting involves trading off the cost of exclusion against the cost of the election, a calculation easier than it looks. No issues exist in which an individual has choices and perfect information about them all. Rather, a continuous stream of issues appears, and individuals have varying levels of intensity of preferences.

The intensity of preferences among voters tends to form a regular pattern. Very few voters feel intensely either way about an issue. The vast majority, the middle, have no feeling at all about an issue and probably do not find the issue itself salient.

Arrays of preferences yield themselves to vote trading—logrolling—as well as coalition building. In cases of public provision of goods, conditions for bargaining emerge: costly participation, isolated issue salience, and unclear estimates of who benefits or pays for policies and by how much. These conditions can create inefficient government action or waste and overspending (Buchanan and Tullock 1962) or just as much inefficiency in solving public problems and achieving the common good through underspending (Downs 1960).

Consider an example Buchanan and Tullock (1962) offer as support for the idea that logrolling tends to create more expenditure than would ordinarily be the case if economic efficiency controlled. Consider the case of 100 farmers in a locality, each of whom is served by a separate access road requiring maintenance. Maintenance of a specific road must have the consent of a majority of voters and, if so, is financed out of general tax revenues levied on all 100 farmers equally. If each road's maintenance is voted on separately and no logrolling takes place, no road improvements would pass under general tax financing. Each road improvement benefits only one person but the cost is borne by several.

Suppose vote-trading agreements can take place. To have his or her road repaired, each farmer must agree to support the road repairs of fifty other farmers to get the fifty-one votes required for his/her own road repairs. The benefit to one farmer is having his own road repaired. The cost to the

farmer willing to trade votes is his/her share of the repairs to be done on the other fifty roads he/she agrees to support. In the general case, each of the farmers will attempt to secure an agreement with fifty other farmers and the agreements will probably be overlapping, because all 100 farmers want to get their own roads repaired. In the end each farmer will have secured agreement to have his/her road repaired. In determining the level of road repairs on each road, the benefit to the farmer whose road is being repaired is weighted against the costs of fifty farmers of repairing it. The costs incurred by the other forty-nine farmers not included in that particular agreement are neglected. Overall, the cost to all farmers will exceed the benefits from the chosen level of repairs in each road. The logrolling process results in over-expenditure.

Anthony Downs (1960) demonstrates the opposite case, the case for spending less than would be necessary. Considering the same example above but substitute higher education for road repair, it might be found that the calculation of benefits each farmer made would result in undervaluing the public expenditure. Arguments, except for the agricultural experiment station, the cooperative extension service, and the college of agriculture at the state land grant university, would probably tend toward belittling most benefits and stressing higher education's costs because the farmers believe the funding should support farming activities. In the end, higher education might be underfunded, given some notion of adequate or efficient funding, and the entire government budget made smaller than economic efficiency might otherwise dictate.

Decision making may be approached through legislative-style logrolling or through executive-centered, means-ends analysis. Logrolling—using the political process to allocate—examines a project in the context of all projects on the agenda for study at one time. The supporters of a project ultimately get their way only because they trade favors with supporters of other projects. The result is a sharing of benefits, costs, knowledge and preference for technique, and collaboration or compromise on goals so that all sets of supporters, as a whole, are better off. Analysis is that allocation principle in which decision makers select a program or project when the benefits and costs are weighted and the result makes society better off. Analysis may take the form of cost-effectiveness analysis or risk-benefit analysis. Cost-effectiveness analysis collects and arranges data to facilitate a comparison of the costs of achieving a desired public program objective required by various alternative treatments, interventions, programs, or policy designs. The criterion for judging the best alternative is either least cost for a given level of effectiveness or greatest effectiveness for a given level of spending. In risk analysis or risk-benefit analysis, risk—the probability of an event multiplied by the event's severity—takes the place cost holds in other forms of analysis. The benefit calculation rests on an estimate of society's willingness to pay to reduce a risk or to forego a benefit.

The problems with logrolling tend to be those related to overspending, a condition supporters of logrolling think is a function of viewing of the needs of the individual as greater than the needs of society. That is, those who favor analysis, and who believe logrolling results in overspending, tend to be those who favor the right of individuals to reach their goals in competition with others without help from government. Those who favor logrolling rather than benefit-cost analysis see the needs of society as paramount, at least those needs that, in the end, are believed to make social benefits greater than the costs to society. The problem with analysis lies in implementing shared benefits in such a way that those who bear most of the costs get enough of the benefits to offset their losses.

5. Individual Irrationality

Public choice theories, like economics-based approaches to policy analysis, depend in both their positive analyses and normative prescriptions on a presumption that individuals behave in largely rational, *homo-economicus*, fashion, at least on average: narrowly self-interested and instrumentally employing logics of consequences in making choices, with the ability to form good factual judgments including accurate estimates of probabilities, and possessed of stable preferences not overly burdened by ambiguity. Even conceptions of bounded rationality, although implicitly allowing for some ambiguity in the form of Simon's (1947, 1997) zone of acceptance, take

limits on attentiveness and ability to calculate, rather than instability or ignorance of preferences and self-interest, to be the fundamental weakness of individual decision rationality. These assumptions, while leading ineluctably to the conclusion that individual rationality tends to produce collective irrationality if left unchecked by coercive institutions (Elster 1989) as well as to the public choice theorists' pessimism about democracy, does at least provide a stable base for analyzing decision problems and prescribing more efficient models of collective decision. Researchers examining individual judgment and choice, however, have identified a number of ways in which the mutability of preferences and tendencies toward biased or otherwise erroneous judgments create significant challenges of ambiguity and uncertainty for individual decisions. Perhaps most widely cited is the work done during the 1970s and early 1980s by Daniel Kahneman and Amos Tversky, for which Kahneman won a Nobel Prize in 2002 (Tversky died in 1996, and Nobels are awarded only to living recipients). In a series of empirical studies and literature reviews, Tversky and Kahneman demonstrated that very small risks are given disproportionate weight, that prospective losses and gains are not treated symmetrically, that the presence or absence of non-selected alternatives can reverse preference orderings, and that the manner in which options are semantically or mathematically framed can exert undue influence on decision makers. These violations of normative standards, in turn, are apt to distort private decisions and public policy alike (Arrow et al. 1998).

An early collaborative article by Kahneman and Tversky reviewing their own and others' empirical work (Tversky and Kahneman 1974) identified three common heuristics that facilitate decision by conserving individuals' attention, but also act as sources of systematically erroneous biased judgments in the face of uncertainty. Many of the observations in this article turn on the reality that probability theory and its implications for statistical analysis are not highly intuitive, but some also identify pervasive challenges to the assumptions that underlie both descriptive and normative theories based on rational-actor models. *Representativeness* heuristics lead decision makers to focus on the degree to which one thing resembles another, and in so doing to neglect more useful information about actual probabilities of occurrence. Thus, in an example offered elsewhere, intuitive thinking leads people to presume that Linda, an intelligent woman concerned with issues of social justice, is more likely to be a bank teller and active feminist than simply to be a bank teller. *Availability* heuristics lead to biases favoring reliance on more readily recalled or located information or more readily imagined possible states of the world, or illusory correlations, rather than correct probabilities. *Anchoring* and *adjustment* produce bias when subjective assessments of probability distributions or of the likelihood of sequential events are based on adjustments to an initial point estimate or other starting point. Although Tversky and Kahneman do not say so in so many words, their findings here are consistent with bounded rationality and the conservation of attention: intuitive heuristics "are highly economical and usually effective" (1974, 1131) but they produce errors in individual judgments that in turn threaten the usefulness of analytic models that presume unbiased rationality of individual judgments in calculating the likelihood or usefulness of particular collective decisions or institutional arrangements. To the extent such biases are in fact systematic rather than random errors and so can be estimated and factored into calculations, of course, it may be possible to account for them in modeling (or manipulating) collective behaviors. In subsequent collaborations, Kahneman and Tversky identified further biases in individual judgment as well as—somewhat more problematically for modeling—ways in which not only positive judgments about objective states of the world but individuals' normative judgments about their own preferences, and hence their choices, could vary according to context.

Still in the category of systematic bias, or at least of errors that are relatively predictable and therefore could potentially be accounted for in economics-based policy analysis or other efforts to structure collective decisions by employing instrumental logics, were the formulations of *prospect theory* (Kahneman and Tversky 1979) and *loss aversion* (Tversky and Kahneman 1991). The 1979 article extended and refined the formulations from the authors' 1974 work, identifying ways in which individuals' choices between alternatives tended to violate the model of decision implied by

expected utility theory. First, they found that evaluative judgments of alternative financial gambles tend systematically to underweight outcomes that have probabilities of less than 1 compared to events believed to be certain. This *certainty effect*, together with a *reflection effect*, causes individuals to tend to be risk-averse facing gains—settling for a smaller but perfectly certain gain over a risky gain with a higher expected value—but risk-preferring when facing losses—choosing a probabilistic outcome with a greater loss over a smaller but certain loss. The *isolation effect* describes the way judgments of value tend to use a simplifying strategy of eliminating from consideration the common features of alternatives to concentrate on the differences. This can result in different choices between alternatives, depending on how they are decomposed into common and different elements. This treatment was extended by their analysis of loss aversion (Tversky and Kahneman 1991) that describes the phenomenon that individuals tend consistently to weight losses more heavily than equal-sized gains. This helps to explain other researchers' findings that individuals often are willing to pay less for a good than they would be willing to accept to surrender it. For an application of prospect theory to the analysis of voting, see Quattrone and Tversky (1988). Somewhat more troublesome for the normative decision theory supporting conventional economic policy and organizational analyses are some of the implications of the ambiguity associated with framing effects (Tversky and Kahneman 1981, 1986) related to heuristic decision processes that rely on the simplifying editing and decision-weighting intuitions identified in prospect theory, and the potential for preference reversal or other effects of context on individual preferences (Tversky and Simonson 1993; Tversky et al. 1990). Different descriptions of decision problems, the use of different procedures for making decisions, and different orders of presentation of alternatives all can alter the choices made independently of the values of the options from which the choice is made. This presents complications for efforts to perform value-neutral policy analysis and even for efforts to direct individual decisions toward organizational purposes. At least as troublesome are the implications that both predictable decision biases and the susceptibility of preferential choices to manipulation by framing. For example, if the public choice theorists' presumptions about the motivations of bureaucrats are correct, this susceptibility of decision to manipulation by framing presents abundant opportunity for manipulations by self-interested administrators. On the other hand, consciousness of the central role of framing effects in the construction of individual and collective judgments can also be seen as offering a way to begin resolving differences toward the adoption of more satisfying collective decisions (Schön and Rein 1994). Additionally, there is at least some evidence that public administrators are on average more motivated to service than exploitation of the public (Hecl 2002). Responding in part to the findings of cognitive psychologists as well as to Simon's insights about the boundedness of irrationality, contemporary work in the field of behavioral economics has begun extending formal neoclassical models for economic analysis by explicitly incorporating various forms of individual irrationality and biases in judgment. Prominent scholars in this area include Thaler (1991) and Matthew Rabin (see Camerer et al. 2004, as well as his prolific output of working papers and journal articles) among others. Colin Camerer (1999) offers a convenient article review of the nascent sub-discipline, and recent articles by Kahneman (2003a, 2003b) explicitly draw together his work with Tversky and other descriptive analyses of decision making psychology, behavioral economics, and bounded rationality. Empirical work by Elinor Ostrom and others has demonstrated, too, that appropriate institutional designs can structure individual judgments and choices, or at least the premises underlying them, in such a way as to suggest that the constructability and manageability of preferences (Slovic 1995) may in fact provide opportunities to enhance collective rationality rather than necessarily diminishing it (Justice 2003).

E. THE NEW INSTITUTIONALISMS

The 1970s also brought renewed interest in the explicit examination of the implications of social institutions for individual judgment and choice and for the aggregation and interaction of individual

decisions into collective action and outcomes. Following Scott (1995) these new-institutionalist frameworks may be grouped broadly into those that emphasize the importance of social institutions as constraints on the decisions and actions of rationally self-interested individuals (the social-realist approach), and those that emphasize the role of institutions in shaping the knowledge, values, and interests—and so the decisions and actions—of individuals and groups (the social-constructionist approach). While the wellsprings of the various new-institutionalist approaches are numerous, the analyses of the Public Choice theorists, agency theory, Mancur Olson's *Logic of Collective Action* (1971), the cognitive revolution in psychology, and the attention of Berger and Luckman (1967) to the social construction and institutionalization of knowledge may be seen as antecedents.

1. Institutional Rational-Choice Frameworks

Rational-actor frameworks build on economic models of human motivation and methodological individualism to analyze descriptively the structures of choice-directing incentives and constraints embodied in particular institutional design features. This analysis in turn leads to prescriptions for the design of institutions meant to improve the likelihood of efficiently and reliably achieving collective rationality in spite of individual rationality. Transaction-costs analysis and agency theory direct the analyst's attention to the roles of costly information and bounded rationality in structuring judgment. The meta-theoretical institutional analysis and development framework (IADF) extends those insights and attempts to identify a comprehensive set of institutional design characteristics and extra-institutional variables that structure individuals' judgments and decision rules in collective action settings. The IADF is grounded in part in a critique of the tendency of some rational-choice frameworks to emphasize hierarchy as the primary means to collective rationality (see, for example, Ostrom 1990).

a. *Transaction Costs and Agency Theory*

Moe (1984) recognized the emergence over the 1970s of a "new economics of organization." He suggested the "new" would be the primary alternative to "the behavioral tradition," that tradition he associated with Simon (1997), March and Simon (1958), Cyert and March (1963), and Cohen, March, and Olsen (1972) for the examination of organizational decisions and behavior relevant to the formation and operation of public bureaucracies (1984, 740; 1995). Moe noted that the development in the 1970s and 1980s of transaction-costs and principal-agent theory approaches to understanding organizational formation and decision could be traced to Coase (1937) but were rooted more immediately in the work of Alchian and Demsetz (1972). Both approaches apply fundamentally neoclassical assumptions about individual self-interest-maximizing motivations and the centrality of incentives to direct individual choice in ways that promote optimal collective efficiency, or inefficiency, but with somewhat more realistic assumptions about information availability, human rationality, and judgment, and the complexity of social interactions. Each has generated an abundant literature of prescription and description, with an emphasis on the analysis and design of organizational incentive structures meant to solve problems of cooperation and hierarchical control.

Like Olson's (1971) analysis, the seminal formulations of transaction-costs approaches emphasized the need for centralized, hierarchical solutions to the coordination of cooperation in the face of presumed tendencies to shirk. Because individual contributions to joint production can be difficult and costly to assess, information and monitoring deficiencies are likely to facilitate shirking, as members of a collective realize that their individual shares of collective surplus may not be closely correlated with their individual contributions. The problem is compounded by the fact that the monitoring of contributions is effectively a collective good, costly to produce but with diffuse and non-appropriable benefits in a hypothetical state of nature, so that there is little incentive for individuals to perform it. Alchian and Demsetz (1972) developed an argument that business

firms arise to facilitate the efficient elicitation of individual contributions towards “team” production. By mutual consent or contract, cooperators select an entrepreneur to specialize in monitoring individual contributions and distributing rewards accordingly, thus maintaining a balance of contributions from, and inducements to, contingently attached cooperators reminiscent of Barnard’s (1968) formulation. Being granted a transferable property right in the net earnings of collective output (the residual) motivate the entrepreneur. This effectively internalizes the externality associated with costly performance monitoring. Williamson’s (1975, 1981) formulations of the transaction costs approach developed more extensively the implications of bounded rationality, environmental complexity, and the costliness of information for buyers’ (we might say principals’) judgments and of human opportunism (“self-interest with guile”), repeated tasks’ “information impactedness,” and small-numbers bargaining for sellers’ (or agents’) choices within transactional relations. Williamson argued that hierarchies are often a more efficient solution than markets in cases of information-related market failures, or “organizational failures.” Bounded rationality and environmental complexity and uncertainty render the formulation and enforcement of “complete” contracts stipulating responses to every conceivable contingency very costly, if not impossible. Opportunistic agents can further take advantage of the “information impactedness” created when repeated contracting for a specialized service enables them to gain unique knowledge of the tasks involved. This reduces the number of competitors at the same time as it makes possible the concealment of true costs and contingencies from buyers, thus facilitating shirking and “perfunctory” rather than “consummate” cooperation by sellers. At the same time, however, the specific expertise acquired in repeat performance of similar transactions, like site- and physical capital-related forms of asset specificity, can create reciprocal dependencies or long-term bilateral relations between buyers and seller (Williamson 1981). An extensive and growing literature in public administration examines the implications of the transactional dimensions of information asymmetry, uncertainty, frequency, and asset specificity, together with the human characteristics of bounded rationality and opportunism for judgments and choices by political principals and agents about operational rules, collective choices, and constitutional arrangements in such areas as legislature–bureau relations (Horn 1995), budgeting (Bartle and Jun 2001; Patashnik 1996), local economic development (Clarke 1998; Feiock 2002), policy implementation (Calista 1994), and the analysis of policy and administrative networks and partnerships (Hindmoor 1998; Jessop 1998; Milward and Provan 1998).

Principal–agent frameworks, or agency theory, also emerged during the 1970s, and have served as vehicles for examining conflict-of-interest-generated problems in aligning the choices of principals (buyers of services) and agents (sellers of services) in the face of information asymmetries that tend to impair principals’ abilities to form accurate judgments about the knowledge, motivations, traits, and performance of agents. These information problems give agents whose interests conflict with those of their principals incentives to shirk (moral hazard), and may even lead to the selection of precisely those agents least suited to a principal’s needs (adverse selection). Halachmi (2003) offers a good summary of the content of agency theory, some issues in the application of agency-theoretic frameworks, and a useful list of references for further reading.

As Moe (1984) noted, there are significant difficulties in translating economic approaches to organizational analysis to the distinctive operating and task environment of the public sector, however. What Moe describes as a central strength of economic approaches—their use of the optimizing logic and many of the parsimony-promoting assumptions of neoclassical economics—can also be seen as making them less realistic descriptively and so somewhat less useful prescriptively in a world of multiple principals, ambiguous goals, and labile preferences. Although attentive to nuances in questions of incentive- and constraint-responsive choice on the part of agents and factor owners seeking to advance their own interests in maximizing personal utility, these frameworks treat principals’ or employers’ choices of goals largely as unitary and unproblematic. They do, however, offer a powerful complement to the behavioral approach for those seeking to understand how the interaction of organizational designs and task structures can

influence individual decisions, and how those individual decisions in turn influence organization-level processes and outcomes.

b. The Institutional Analysis and Design Framework

The IADF (Kiser and Ostrom 1982; Ostrom 1986, 1990, 1999b; Ostrom and Walker 1997) retains the core premises of methodological individualism and rational choice in understanding people's responses to collective action dilemmas while expanding the scope of analysis to understand better how the interactions of multiple rules and multiple levels of rules work in specific social and physical contexts to shape individual judgment and choice and thereby influence collective decisions and outcomes. The IADF also differs from other rational-choice frameworks in avoiding the implicit or explicit presumption that hierarchy is necessarily the most efficient design for reducing uncertainty, opportunism, and the resulting collective irrationality in the face of joint production or consumption. Among the innovations of the IADF is its explicit attention to the interdependence, or configurational nature, of rules governing decisions and actions. Like those considered above, this framework attends closely to the effects of operational rules governing monitoring and enforcement, but it also takes account of the ways in which their effects are mediated by the nature of rules governing policy making and management in a variety of formal (such as courts and legislatures) and informal (such as teams and committees) arenas at the collective choice level of analysis, and by the rules determining how collective choices will be made at the constitutional level of analysis. The configuration of rules at all three levels is understood to structure the decision situation faced by an individual and thereby to influence his/her judgment about the consequences of alternative choices, and thereby his/her choices among alternative courses of action.

Empirical applications of the IADF have led to a number of insights into the contextual factors that increase the likelihood of successful self-governance and self-organization, and to a range of institutional-design prescriptions for effective and sustainable collective action. Paralleling some of the extensions of transaction-costs analysis that suggest hierarchies need not be the most effective devices of social coordination (Calista 1994; Frances et al. 1991; Hindmoor 1998), research using the IADF to analyze common resource-management regimes has demonstrated that in fact self-governance is often more effective than hierarchical control for securing collective action and collective rationality (Ostrom 1990; Ostrom and Walker 1997; Tang 1992). These findings prove challenging to reconcile with traditional rational-choice assumptions about self-interested preferential choice, however. Potential explanatory mechanisms, such as social capital (Ostrom 1995), the centrality of trust and reciprocity as well as mutual expectations (Ostrom 1998), the evolution and individual adoption of norms and beliefs (Ostrom 2000), and the possibility that self-governing institutions function as complex adaptive systems (Ostrom 1999a), suggest even to committed rational-choice scholars the need for "second-generation models of empirically grounded, boundedly rational, and moral decision making" (Ostrom 1998, 15).

2. Social-Constructionist Approaches to Institutional Analysis

An alternative group of institutional analysts focus more on the cognitive and normative consequences of institutions than on their rational-individual-constraining designs and incentive structures. "Social constructionists embrace the most far-reaching and all-encompassing version of institutions: institutions are seen as constituting the rules, defining the players, and framing the situations. The interests and identities of the principal actors are socially defined and expected to vary across place and time" (Scott 1995, 137). Preferences and meanings, rather than being stable and exogenous are in fact institutionally contingent and endogenous (March and Olsen 1984, 1989), decisions and policies can aim at symbolic as well as instrumental ends (Yanow 2000), choices can reflect practical logics of appropriateness as well as instrumental logics of consequences, and

“decision structures themselves create the premises of decision” (March 1994). From this perspective, the task of institutional analysis is to understand how social institutions constitute individual and collective rationality, judgment, and choice. Although there are examples of constructionist analyses of instrumentally constructed institutions (DiMaggio 1991; Galaskiewicz 1991), the constructionist perspective has not to date generated as large a body of prescriptively oriented institutional-design studies as has the realist perspective.

An example of a mixed realist–constructionist descriptive analysis is Searing’s (1991) examination of the decisions and behavior of British members of Parliament (MPs) extended a rational-actor framework that assumed self-interested individuals pursued instrumental maximizing strategies by also taking into account the mediating effects of coercive institutional-role-specific rules and sanctions (such as those governing ministerial assignments) as well as “informal” institutional rules that established norms of appropriateness for MPs who accepted roles such as “constituency member” or ministerial aspirant.” In another example, Miller found that the judgments informing capital financing decisions by public financial managers were structured by their ongoing relationships within debt management networks (Miller 1993).

Recent work by Klijn (2001) also indicates some of the potential for synthesizing social-realist and social-constructionist approaches to understanding the implications of institutional characteristics for decisions and formulating second-generation models of decision making. Klijn’s research examined both the behavior-regulating rules (governing such actions as policy setting entry/exit, positions, interactions, distribution of rewards, and so forth) and the reality-constituting rules (such as actor identities and professional standards) at work within a policy network. Although this research was not prescriptively design-oriented, it demonstrated the configurational effects of rules governing cognitive and normative premises as well as those regulating behavior. Cognitive, normative, and regulative rules proved interdependent and to some degree mutually constitutive, and differences in the configurations of rules accounted for differences in the decision processes and outcomes associated with different policy networks. Another synthesis of realist and constructionist perspectives, in an institutional analysis of business improvement district governing bodies, found that greater levels of cooperation resulted from the cognitive and normative effects of behavioral constraints stipulating both compulsory finance and self-governance (Justice 2003). At the same time, the design of the behaviorally coercive elements of institutional rule configurations reflected normative and cognitive bases for judgment and choice as well as rational calculations of efficacy. Individual judgments and choices at the operational and collective choice levels were observed to mix rational and practical bases inseparably.

3. Summary

A number of frameworks for institutional analysis have been developed, elaborated, and tested from the 1970s to the present. The rational-choice frameworks complement the insights of the behavioral and psychological understandings of judgment and choice by offering a guide to the analysis and design of structures to constrain the choices of self-interestedly rational individuals and thereby to simplify judgment by reducing uncertainty. The social constructionist perspective helps to elucidate the ways in which institutional structures shape the cognitive and normative premises of decisions.

Synthesis of the two thus holds the potential to facilitate the effective integration of insights into individual decision and choice derived from psychological decision research as well as insights into the collective consequences of individual decisions drawn from the behavioral approach and economic analyses of collective action problems. Systematic attention to the decisional contexts created by configurations of cognitive, normative, and regulative institutional rules can elucidate their implications for individual decision premises and choices as well as for the ways in which deliberation and other forms of collective choice interaction alter individual and collective decision premises and preferences.

Institutional arrangements are important determinants of the bases for individual judgment and choice and can increase or decrease uncertainty and ambiguity as well as conflicts of interest, with consequences for collective decisions. Intended rationality in decision employs preferential and judgmental elements that are in significant part institutionally created, and practical logics can supplement or supplant intended rationality as the basis of choice. Systematic analysis of institutional design properties and their effects thus can advance the larger project of using social structures to enhance collective rationality in decision making by both constraining and constituting individual rationality.

VII. CONTEMPORARY DEVELOPMENTS AND TRENDS OF THE EARLY TWENTY-FIRST CENTURY

Over the past two decades or so, decision makers and decision researchers have integrated previous experience with, and study of, decision making in a variety of ways. A number of techniques have been developed that integrate normative and intuitive judgments with more systematic and technical approaches to rational decision making. At the same time, dramatic developments in digital computer and telecommunications technology have facilitated the storage, transmission, and use of vast quantities of data and transactional records for inductive analysis to support decisions and enhance their rationality. Contemporary instruments have also made possible the study of human physiological processes of decision making in a variety of laboratory settings. The resulting explosion of new techniques for making and understanding decisions is too vast to be addressed comprehensively here, but the following section attempts to identify very briefly some recent developments of interest for public administration and sources for further reading.

A. INTEGRATIVE MODELS OF DECISION

A number of recent developments involve proposals or practical attempts to transform the making of policy-related decisions by better or more explicitly integrating aspects of public policy and administrative decision, as advocated 80 years ago by Mary Parker Follett (1924, 1940). Some efforts to promote the integration of practical knowledge within organizations, negotiation and conflict resolution, the integration of normative and instrumentally rational logics of policy analysis, and the integration of expert and lay preferences and knowledge through models of collective decision making that employ technology to mitigate traditional obstacles to direct participatory democracy are noted here. Within organizations, efforts to enhance decisions over the past half-century or so have included attempts to integrate the knowledge of multiple members of organizational elites, such as the Delphi techniques, and efforts to bring the knowledge of rank-and-file members of organizations to bear in the analysis and improvement of production processes, such as Edward Deming's total quality management (TQM; White and Wolf 1995a, 1995b). As with management by objectives (MBO; Drucker 1976)—an approach to eliciting organizational members' knowledge of both production processes and their own capabilities—TQM was understood and implemented in a vast range of ways over the second half of the twentieth century, including many that proved to work in ways that countered their inventor's intentions to foster relatively more egalitarian and empowering modes of decision, and often with results considerably different from expectations. More recently, researchers and practitioners have been explicitly attentive to the problem of knowledge management, often advocating the nurturing of communities of practice as ways to ensure that individuals' knowledge of organizational processes and environments is systematically available to other members whose judgments and choices can thereby be enhanced (Newcombe 2002; Wenger et al. 2002).

The last quarter of the twentieth century also saw the burgeoning of a literature concerned with integrative approaches to resolving disputes; reaching mutually agreeable negotiated choices, and collaborative decision making. Like McGregor's Theory Y, the method of integrative,

interested-based, “principled” negotiation articulated by Fisher and Ury (1983) is nearly ubiquitous by now as an espoused norm, although perhaps less frequently observed in practice. In a related vein, a substantial literature has developed that offers favorable assessments of the value of, and suggestions for, the implementation of collaborative forms of decision making.

Collaborative models seek to promote multi-party models of integration and interest-based efforts to identify and realize common goals among multiple sectors, organizations, and individuals (Chrislip and Larson 1994; Gray 1989, 1996; Gregory et al. 2001; Huxham 1996). Chrislip and Larson in particular set out to answer the question, “Can civic community be created?” beginning with the premise that “if you bring together the appropriate people in constructive ways with good information, they will create authentic visions and strategies for addressing the shared concerns of the organization or community.” Stakeholder participation of the type advocated by Chrislip and Larson has been found empirically to foster better quality decisions in the area of environmental policy by at least one researcher (Beierle 2002).

In the realm of policy analysis, integrative models seek, if not necessarily to transcend, at least to take explicitly into account the critiques of purposely value-neutral and self-consciously scientific policy analysis by allowing for the consideration of biases introduced by economic techniques of analysis (Tribe 1972) or other forms of institutionalized knowledge that structure judgment and choice by narrowing the range of perspectives and evidence employed by analysts and other decision makers (Forester 1999; Schön and Rein 1994). One elaborately worked out framework for policy decisions is Fischer’s (1995) model for explicitly integrating “politics and science,” or values and facts, across multiple levels of technical analysis and normative judgment and choice. Fischer identifies four discourses within two levels of social decision making. At the more specific level, a normative discourse concerns the desirability and relevance to particular problems of the programmatic outcomes identified through “technical-analytic” methods such as evaluation research and cost-benefit analysis. At the level of social choice, a “systems discourse” involves empirical consideration of the broad societal consequences of policies, while an “ideological” discourse concerns the appropriateness of the broad social values embodied in the social outcomes. Bogason’s (2000) institutional model of “collective public action” seeks to reconcile post-modern fragmentation with the need for cooperation. To make sense of the complex, “post-modern” mix of interacting public and private decisions in local governance, Bogason urges analysts to use both top-down and bottom-up understandings of how individuals use “public means to pursue their own course of action” (173). Interpretive models of analysis are needed for this because policy actors make instrumentally rational decisions, but also tend to reformulate their goals and preferences in response to their judgments of what is attainable (175). A complementary argument, from an avowedly rational-choice perspective is offered by Elinor Ostrom (1999), who echoes Lindblom’s incrementalist claims in arguing that the three core assumptions of conventional policy analysis—short-term economic rationality, susceptibility of systems to comprehensive analysis, and equation of organization with central direction—are empirically unsupported. Instead, policy should be understood as an experiment, and the broadly polycentric complex-adaptive-systems concept should be considered a desirable approach to the organization of decision making for responding to policy problems and conceivably achieving “better than rational” decisions.

B. TECHNOLOGY-FACILITATED DECISION MAKING

It is easy for those born in the last quarter-century to take for granted the extent to which contemporary computer and telecommunications technology facilitates the management, exchange, and utilization of information in many forms. While digital computers have been available since the 1940s and electronic communications media since the nineteenth century (if one includes basic telegraph and telephone service), in the last part of the twentieth century the development of powerful desktop computers and the Internet transformed the technology of computing and communications yet again.

In the early years of the twenty-first century, e-government—the use of computing and telecommunications technology to transform the relationship between government administrators and citizens—has been the topic of considerable attention by academics (e.g., Justice et al. forthcoming; Melitski et al. 2005; West 2004). While e-government appears in its successful implementations to have made information more readily available to citizens and specialist decision makers and to have made many routine transactions vastly more convenient by making it possible, for instance, to purchase a dog license at 3 a.m. without leaving your apartment, there is little evidence as yet that the more dramatic claims about e-government's potential qualitatively to transform the citizen-government relationship have been borne out. Within administrative organizations, contemporary computing, and communications technology unquestionably increases the speed and quantity of communication and data gathering, although those gains may be balanced by reductions in quality and by strains on the allocation of human attention, the scarcest of all resources (Simon 1978). Even before the ubiquity of personal computers and their interconnection through the World Wide Web, however, researchers in public administration and other fields concerned with decision worked to exploit the potential of digital computing within administrative organizations. Computers have been routinely used by public and private organizations alike for several decades now to process basic transactions, to maintain records of those transactions and the entities involved in those transactions, and to analyze and reduce the resulting vast collections of data by means of management information systems (MIS) and decision support systems (DSS) that seek to digest large quantities of data into concise, structured, decision-relevant information for use by organizational decision makers. Recent developments in this area include the development of software and techniques to facilitate data mining, the identification of relevant patterns or exceptions among large quantities of data.

Other uses of computers seek to transform the study of decisions and intelligence and the making of decisions in and by organizations altogether. In keeping with his concern for systematically working to expand the boundaries of individual rationality, Herbert Simon was among the pioneers in researching the application of computing technology to expert systems and other forms of artificial intelligence (AI), that involve “the phenomena that appear when computers perform tasks that, if performed by people, would be regarded as requiring intelligence—thinking” (Simon 1995, 95).

Finally, the emergence of efforts to use information technology to realize new forms of participatory democracy are noted. At the turn of the century, a number of attempts have been undertaken to integrate directly the judgments of multiple lay and specialist actors by using contemporary information technology to overcome the scale-based obstacles to mass participation that have traditionally made republican or elite-governed forms of collective decision seem necessary (see Madison, *Federalist* No. 10) or inevitable (Nie et al. 1996; Michels [1911] 1999) in collectivities of more than minimal size, even when democratic norms are espoused. The use of large numbers of trained facilitators and computer technology has been employed to structure a form of mass deliberation. An early demonstration of the technique by one firm, AmericaSpeaks, took place in 2002, when several thousand people in New York City participated in discussions about how to redevelop the site of the destroyed World Trade Center (Harmon 2002; Lowe 2004). The format involved 4000 citizens grouped around hundreds of round tables in the Javits Convention Center, with technology used to facilitate brainstorming and display participants' responses to several proposed development plans on screens visible to all participants. Several hundred others participated online. Although the arrangements for collecting and filtering individual tables' ideas before displaying them for general consideration mediated the directness of the mass discourse (see Civic Alliance to Rebuild Downtown New York 2002), and the role of the participants was advisory and based on proposals already formulated, the method still provided what one participant described as a rude awakening for the public officials who had overseen the development of the plans proposed up to that time. By the end of the long day, there were signs that the ‘decision makers,’ as the men in charge of rebuilding were called, realized that the original program needed

some reassessment (Szenazy 2002, A19). Other projects seeking to take advantage of contemporary information technology in promoting various forms of deliberation and collaborative decision making include the Deliberative Democracy Consortium (Lukensmeyer 2006) and the Institute for Contemporary Agoras (Christakis 2006).

VIII. CONCLUSION

We now return to the original questions about elites and their responsiveness to the public interest through governance institutions. What is known about decision making when framed through the question: who should respond to whom? Our three sections deliver some answers. From the Federalist Party domination of government to the Lincoln administration, few can doubt the three trends—expanding presidential power, a growing system of spoils in determining who might be a good administrative decision maker, and an increasing need for administrative capacity in national, state, and local governments. The trends in this initial period led to the dominance of administrative reform in the second era. Administrative institutions—a civil service system and an executive budget system—heralded the beginning of the administrative state. The second period matured with a strong sense of need for government institutions to manage while many who belonged to elites that conformed to religions based on efficiency, progressive government, or market primacy coalesced to engineer the institutions of government to produce good administrative decisions. The third period after World War II has a strong scent of managerialism. Decision making gained a primary role in what became management, a social science with the emphasis on science. To many, the victory of technique over purpose enslaved both the administrative decision maker and the citizen, taxpayer, and client to administrative institutions and their logic of appropriateness, if not the logic of consequence. At the end, it is still asked: who should respond to whom? What does the future hold? And who—which elite or subgroup of citizens—rules? As for what the future holds, we see better description of the decision making process surely, enhanced decision support systems for uncontested decisions probably, but easier or more efficient ways to accomplish contested collective decisions maybe or maybe not. Researchers have not thoroughly evaluated facilitated group decision making, experimentally or otherwise, and fundamental problems of incommensurability of competing values and pervasiveness of ambiguity will always remain.

As for who decides, both Kaufman (1969) and Rourke (1992) argue there is a succession of values that provide a reason to wrest power to decide from one decision making institution and give that power to another. They document periods in US history when events and dominant, popular views of how government should perform have led the people to place one of the three values ahead of the others: representativeness, strong executive leadership, or neutral, competent, expertise. Rourke (1992) points to a recent trend toward executive leadership and away from neutral competence, especially in the new importance of political responsiveness and the availability of expertise outside the public service. He asks (539–546) whether a neutrally competent bureaucracy has lost its relevance and provides the answer: “In ... American politics, bureaucrats are ... suspected of being biased rather than neutral in their policy perspectives or even of trying to sabotage policy proposals that political leaders want to put into effect.” Rourke sees bias as a poison that “threatens to undermine the legitimacy of bureaucratic participation in national policy making [especially as] courts have always regarded the professional expertise of bureaucrats as the chief justification ... in a democracy for allowing... unelected officials to ... [help shape] the country’s policy decisions.” The bias may lie in parochial views, ideology, professionalism or, most importantly, institutional values. Bias is no more or less than an instance where institutions constrain individual views, decisions, and actions.

To bias, Rourke adds dispensability instead of indispensability and ordinariness instead of uniqueness. Rourke (540) argues that policy makers turn more and more frequently to private

organizations for help in designing organizations and policies. These leaders have privatized bureaucratic expertise by using “former government officials [and those] working in universities, think tanks, or private consulting firms” as well as better equipped and staffed in-house expertise.

This wariness or irrelevance of neutral competents and their expertise in administrative agencies may be good and bad for decision making. Rourke remembers the legitimacy issue in arguing (540) that administrators in government never had any constitutional role. Administrators relied on the willingness of leaders to consult them. Yet, leader willingness comes with a price in political responsiveness, Rourke points out.

What has decision making in institutions lost? Rourke notes (545) that neutral and expert public administration has become a form of professionalism, especially in giving first loyalty to one’s knowledge base and code of proper practice. The professional administrator practiced the belief that analysis could not be shaped by political pressure. Rourke illustrates (545) the professional–political tension as “an endemic problem for scientists working for the federal government, but it is a difficulty that [lawyers] in the Justice Department, for example, have sometimes had to [face in choosing] between their responsibility to serve the president and their professional obligation to abide by the laws they have sworn to uphold, not least of all the Constitution of the United States.”

Professionalism, neutrality, and expertise compete with political responsiveness, nevertheless. From Rourke’s stand point, the competition puts the non-partisan professional at risk. The American public wants expertise held responsible by political controllers that voters can reward and punish. He also believes we will continue to value responsiveness and professionalism, if sometimes favoring one, sometimes the other. Neutral competence, Rourke says, has proved valuable enough to continue revering whether dominated by political controllers or professions at any particular time. Good governance could not be so without the non-partisan sources of knowledge and savvy about the social and technological worlds.

Political responsiveness, whether to Congress, which votes program authority and appropriations, or the president, who directs analysis for formulation and implementation, will energize cross pressures for neutral competence, Rourke says. Kaufman agrees that as one value dominates, the other two form a set of contending, competing alternatives to its dominance.

Within the succession of values lies the answer to the “Who rules?” question and the method by which decision making may be understood in an historic context. Each of the values Kaufman and Rourke have observed—representativeness, strong executive leadership, and non-partisan expertise competently applied—has for a time been the espoused ideal for administrative decision making, whether because of its presumed efficiency in keeping with a constitutional-level logic of consequence or because of their presumed closeness to the inherent ideals of democracy, a logic of appropriateness. At the same time, each has always been present to some degree in American governing institutions, and often in the makeup of individual administrative decision makers. The dynamics of value succession provide researchers a value path to understand institutions and decision making at both the individual and aggregate levels. Democratic administration may be understood as an elusive ideal or even as a contradiction in terms, but it remains central to the expressed values of American public administration.

I. INTRODUCTION

The field of decision-making in public administration and public affairs frequently defies clear-cut definition and categorization, yet it has particular bearing for public administrators today and in the future. In the complex field of program and service delivery, managers are often put in the position of having to make a variety of decisions—ranging from routine, structured situations, such as the processing of payroll, to highly unstructured, nonroutine situations, such as making trade-off

decisions among a variety of programs (Simon 1973). The purpose of this chapter is to examine five tools, concepts, or strategies that can be useful to managers in terms of effective decision-making.

II. DECISION TYPES

Distinct from the concept of policy, which is generally defined as a principle or rule, is a decision, which can be defined as the exercise of judgment in any particular situation. A useful distinction can be drawn between routine and nonroutine decision types. Herbert Simon, who defines the two types as “programmed” and “ill-structured,” views routine decisions as those that can be made in a prescribed manner (Simon 1973, 1980). Often of an administrative or procedural nature, these decisions are governed by the traditional mores of the organization: the public agency has historically operated in a particular manner, the clients or constituent groups have grown to expect a fixed pattern of behavior, or the agency is governed by established rules and legislative mandates that circumscribe its activities.

Conversely, nonroutine or ill-structured decision types involve complex problems and issues for which no precedent or pattern exists. Kenneth J. Radford describes some of their primary characteristics:

- Only limited information is available with regard to the problem.
- The individual facing the problem may have more than one objective—some of which may be in conflict.
- More than one participant in the decision process may have the power to influence the choice among alternatives.
- Disagreement may exist over the priority to be assigned to various objectives as well as over methods of evaluating progress.
- The particular problem being discussed may be linked to other problem situations. (Radford 1977)

As Radford points out, one of the distinctions between programmed and nonprogrammed decisions is the amount of information that is available to assist the decision maker. For routine administrative decisions, information is processed to the extent that it matches the required input format. In a social service agency, for example, the caseworker frequently enters the relevant information about a client on forms which, in turn, are entered into a reporting system. Based on this data, levels of eligibility and availability of service are determined. Information that does not fall within the present reporting categories is not used. Benefits of a system of this kind are: decision criteria are unambiguous and applied to cases by class of problem, an increased number of clients are serviced, and caseworkers do not reach decisions on a case-by-case or idiosyncratic bias. There are limitations as well to such systems. There is little or no room left for including additional information that the client feels is important to his or her case. The caseworker often becomes frustrated by the process—performing a processing role as opposed to a professional service activity.

At the opposite extreme, individuals in a public agency may be required to make decisions based on limited information. Returning to our social service agency, we see problems that arise for which no procedures or documentation exist. A program to establish counseling for unwed mothers is one example of this decision situation. Although the funding for the program comes from the federal level, state and local social service agencies must often operate on limited or nonexistent information in establishing standards and monitoring progress. Should the program be relatively passive in nature (i.e., providing service to those individuals who contact the agency)? Or should an active search program be enacted by contacting recipients through school districts and community groups? What, in fact, is the estimated number of individuals who would participate, and over what

period of time? These questions illustrate the nature of a nonprogrammed or ill-structured decision situation.

III. DECISION-MAKING STYLES AND PROCESSES

In addition to different decision types—structured versus unstructured—the context of decision-making in public organizations also involves alternative decision styles as well as approaches. These must be carefully weighed when considering which tool or technique should be utilized.

Briefly, decision styles can be classified in three ways: autocratic, democratic, or *laissez-faire*. An *autocratic* decision style would be one in which the individual makes the decision with little or no consultation from others. Naturally, this approach makes implementation more difficult because those charged with implementation must be convinced of the relative worth of the decision itself. In certain circumstances, this form of approach is necessary; military exercises or crisis situations necessitate this form as time becomes a critical factor. Other situations may arise in which the individual making the decision may have greater insight or access to crucial information that must be factored into the decision itself. Finally, there are instances in which legal or statutory constraints must be considered. Problems arise in using the autocratic approach when managers have not been adept at communicating the broader context of the situation. Others tend to view such an approach as either heavy-handed or capricious.

Different from the previous approach, the *democratic* style emphasizes decision-making in which all parties to the situation seek to come up with a mutually agreed-upon outcome. The benefits of such an approach are several. Implementation becomes easier because all concerned parties have provided some degree of input—in a sense they have bought into the decision itself. Other benefits include the incorporation of multiple points of view and the integration of several sources of information. Finally, communication is greatly facilitated in this approach. One word of caution is in order. The democratic approach may not be suitable in certain situations, particularly those in which time efficiency is critical.

The final decision style, *laissez-faire*, is an approach in which final decision outcomes emerge with little or no direction from those in leadership positions. Examples of the *laissez-faire* approach are often found in matters that may be politically sensitive—the public desires action but to act may be damaging, either to the individual or to the organization overall. One way of addressing the issue is to postpone direct action—arguing instead for further analysis, public testimony, or some independent committee action. The use of this particular decision style is not strongly advocated because it tends to be highly risky and there is no sound method for gauging anticipated reactions from postponing action.

In sum, the use of any of three decision styles is contingent on a number of factors: (1) the extent to which legal, statutory, or programmatic constraints preclude making any additional adjustments, (2) the available time in which the decision must be made and implemented, and (3) the balance between the quality of the decision and acceptance by others, and finally, the expectations of those involved (Fiedler 1967).

The decision process is concerned with various steps that are involved in progressing from the issue or problem to final implementation (Dunn 1981; Kingdon 1984). One of the distinguishing features of this approach is the emphasis on the *process* of decision-making, whereas others often focus on the institutional or behavioral elements involved in reaching decisions (Cohen and March 1986; Selznick 1957). Figure 8.1 provides a rough schematic of this process.

The first stage of the process, *problem or issue identification*, involves several elements. Of primary concern is the necessity of differentiating symptoms from causes. An example of this would be a marked increase in incidences of alcohol and drug abuse for a particular region. There may be several causes for this marked increase—ranging from the fact that more individuals may have been identified to a sharp increase in the unemployment rate in the area. It is therefore

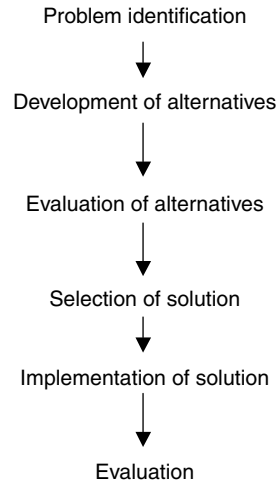

FIGURE 8.1 The decision process.

critical that managers take into consideration patterns of cause and effect; to overlook this distinction may mean inefficient use of agency resources and energies.

Another factor to consider in the area of problem identification is reliance on historical data. Those involved in efforts to resolve the particular problem or issue must be sensitive to the fact that historical data may be limited in scope; certain problems or issues are often unique or may occur infrequently. Other methods of correcting for this include the use of brainstorming techniques or Delphi (Worsham 1980). A brainstorming tool is the use of Paramind Brainstorming Software, created to gather every useful idea possible by the “exhaustion of the interaction of words” (ParaMind Brainstorming 2005).

The use of brainstorming is particularly effective when defining the nature of the problem or issue. The brainstorming technique requires participants to list their ideas in a free-form manner as quickly as possible. This avoids any attempt to bias the particular listing or preclude any suggestion—no matter how seemingly radical. This listing is subsequently analyzed, and through an iterative process, a key set of issues or problem areas is derived.

The Delphi method involves a different approach. Rather than have free-flowing input by all, a core group of experts on a particular set of issues is identified. This panel of experts then provides input (independently) as to the probability of certain events taking place, the nature of issues that will be unfolding, solutions to the problem posed, and the like. The results are then collected, tabulated in some form, and then transmitted back to the experts for further clarification or reduction to a manageable number. The critical variables in this process are the selection of the panel of experts and the rationale used to reduce/consolidate the results. But used correctly, the Delphi method is an effective tool for forecasting those problems or issues for which little historical data exist.

The second stage in the decision process involves the *development of alternatives*. This is closely linked with the prior stage of problem or issue identification, as the manner in which the problem or issue is defined will influence how alternatives are generated. For example, the development of a major metropolitan airport is an issue that many jurisdictions now face. Defining this issue as one involving strictly transportation policy would limit further analysis to various tradeoff analyses of one mode of transportation versus another. Broadly defining the airport development as encompassing economic development brings demographic, social, and technological factors into the process.

In addition to the issue of scope, the development of alternatives in the public sector surfaces the debate as to rationalism versus incrementalism (Wildavsky 1964). The rationalist argument states that all alternatives are considered. No alternatives are dismissed, and it is the subsequent analysis which will determine the optimal approach. Conversely, the incremental approach holds that, particularly in the public sector where many interests are involved, it is extremely inefficient to both generate a list of alternatives and achieve consensus on them.

Whether the rationalist or incremental approach is utilized depends on several factors, not the least of which is the amount of time and resources available as well as the complexity of the particular issue. Suffice it to say, the rationalist approach is perhaps better suited to more compartmentalized units or divisions in which managers have some degree of discretionary authority and control. As problems or issues unfold at the interagency or interdepartmental levels, the ability of managers to develop a degree of consensus on the range of alternatives to be considered is limited at best.

However, there are ways to merge aspects of both rationalism and incrementalism. James Brian Quinn (1980) refers to this approach as “logical incrementalism”. One way of defining this approach is to consider the manner in which most of us make decisions. Rather than concentrate on a few select alternatives, we tend to focus on a range—excluding, for the most part, the extremes. We avoid the expenditure of time in analyzing all of the possibilities, but, at the same time, we have some degree of choice or options. The third stage of the decision approach, the *evaluation of alternatives*, is the area in which a great deal of the balance of this chapter will focus, for it is at this stage that we often associate the use of analytical tools and techniques for making decisions. Yet it is also important that we consider the broader context which precedes and follows this particular stage. Analytical tools and techniques should not be viewed as a replacement for managers; rather, they are supportive methods for allowing managers to make better decisions—the end result being increased productivity (qualitatively and quantitatively).

The evaluation of alternatives involves two additional concerns. First, evaluation should consider a mix of both the qualitative and quantitative aspects of program or service delivery. Susan and Martin Tolchin, in *Dismantling America: The Rush to De-Regulate*, bring this point out vividly when they examine controversies over the use of cost-benefit analysis in implementing regulation (Tolchin and Tolchin 1983). Their argument is that because agency regulators face difficult tasks in substantively articulating the qualitative aspects of a particular program or service, the courts have increasingly excluded its use in analysis, in a sense leading to least-cost analysis. Naturally, this puts a greater burden on the public manager to further develop and refine qualitative measures (Haberman 1978).

A second concern on the evaluation of alternatives involves the use of standards or criteria. Frequently, alternatives are evaluated with little or no attention devoted to standards for judging performance or adherence to the overall goal. One means of remedying this situation is the development of specific and verifiable standards. These may range from such rudimentary standards as citizen satisfaction (however defined) to program cost maintenance or recovery. In addition, such standards should be viewed as dynamic in nature, because as external events or donations change, so too should standards (Simon 1978).

The fourth stage of the process, the *selection of solution*, is largely dependent on the method of evaluation that has been utilized in the prior stage. For example, the nature of the critical path method (CPM) is to select the optimal path (or approach) based on the allocation of resources as well as time. Cost-benefit analysis should similarly select the program or service option that yields the greatest net benefit to net cost. The increasing introduction of computer-based models into the office and work setting has also greatly contributed to selection of solutions, due principally to their ability to process a great deal of information in a rapid fashion (Kraemer and King 1977). Perhaps one aside here is that administrators, those in upper levels of management, have a tendency to also rely on their

own intuition and experience in selecting and backing a particular solution (McGowan and Loveless 1982). It would be interesting to note how many would alter their choice when faced with a solution that is contrary to their intuitive sense or experience. Finally, selection of the solution, particularly in the public sector, involves the necessity for a tradeoff between efficiency and equity.

The fifth and sixth stages of the decision approach primarily involve the *implementation process and follow-up* (Mazmanian and Sabatier 1981; Williams et al. 1982). As previously noted in the discussion of decision styles, a manager who adopts either an autocratic or democratic style may be faced with a different set of issues in implementation. If his or her priority is the relative quality of the decision as opposed to its likelihood of acceptance, then an autocratic approach is called for. This would entail an additional expenditure of time in the implementation phase by having to convince others that the decision is necessary and should be followed. On the other hand, if the priority is acceptance of the decision as opposed to its quality, then a democratic approach is appropriate. In this case, implementation is significantly eased as others are brought into the decision process. In both cases, the individual may be trading off time at certain phases of the process.

The final stage of the process, *evaluation and feedback*, is perhaps the weakest phase of the entire process. In the public sector, this is particularly critical as tools of formal program and service evaluation still tend to be rudimentary and under the control of such groups as the Office of Management and Budget, the United States General Accountability Office, and the Congressional Budget Office. Certain states and localities also have companion organizations (e.g., legislative post-audit organizations), but in general, formal feedback and evaluative mechanisms for most public managers are not widely in place, giving way in most instances to such evaluative means as legislative oversight, hearings, and the like. To improve this last phase, effort is needed to tie such evaluation to the previously articulated standards as well as the initial problem or issue.

Understanding differences in decision-making styles may be enlightening, and having a rational framework to guide the decision-making process may provide useful structure for resolving and solving problems. However, most complex decisions are messy and require real trade-offs. One method has been suggested for simplifying the complexity of decisions (Hammond, Keeney, and Raiffa 1998).

IV. FIVE MAJOR CONTRIBUTIONS TO DECISION-MAKING

Attempting to select five tools, concepts, or frameworks that are current and useful for decision-making in public administration is difficult at best. Others might select a different set of tools. We have selected three recent and emerging tools for management, which include value chain analysis, knowledge management, and e-government. In addition, we have included two older tools that have important staying power for managers: benefit-cost analysis, and strategic planning and management. The tools will be discussed in this order. Our intent is to provide a brief overview, including some references and Web links that will be useful to readers so they might conduct their own more in-depth searches.

A. SUPPLY CHAIN MANAGEMENT

The field of supply chain management has contributed a great deal to the field of public sector decision-making. Yet, prior to looking to its various applications, it must be clearly defined. Actually, the concept and roots of its origin are embedded in systems logic and theory (Simon 1973, 1980). This would entail such notions as: holism, synergy, feedback, and negative

entropy. Of particular note is the fact that subsequent decision-making tools, such as total quality management, management by objectives, and even re-engineering, utilize similar systems logic concepts.

The concept of *holism* implies that one examine the entire enterprise and not simply a singular aspect. As an example, for a transit authority in a municipality to assess the effectiveness of its bus system without looking at the trade-offs in highways, subways, light-rail etc., means that the analysis would be inherently flawed. Indeed, most jurisdictions today adopt a multimodal approach—particularly given the costs associated with upgrading the overall transportation infrastructure. To put it in more basic terms, one wants to look at the forest as opposed to the trees. Supply chain management emphasizes a similar point.

Synergy is another concept that is basic to supply chain management as well as the other techniques that were previously listed. To paraphrase the infamous $1 + 1 = 3$, synergy addresses the issue of how one leverages resources in the most cost-effective manner. Given the pressure on the public sector to do more with less, this becomes more acute. For example, a number of jurisdictions have changed their voting systems. Rather than go to a designated polling precinct that needs to be staffed and operated under established dates and times, one can vote by mail or at their neighborhood grocery store. Indeed, voting by the Internet is not too far from becoming a common reality. The direct relevance to supply chain management is the fact that managers are learning to transfer best practices from one area to another. The key will be to develop the best mechanisms for doing so—ranging from formal suggestion systems to informal word-of-mouth or anecdotal evidence.

Feedback systems provide another vital component from systems logic and theory. As such, the notion is that any effective system—whether a municipality, federal agency, or state entity—receives information from its constituency and responds accordingly. For governmental organizations, feedback has tended to be reactive in nature. Constituents vote in someone else or decide to litigate. But governmental bodies, in some cases as a result of this passive approach, have made significant strides to be proactive. The Internal Revenue Service, for a long time the target of politicians' as well as taxpayers' wrath, has made a concerted effort to strengthen its image by utilizing focus groups, soliciting feedback, and providing taxpayers with the name and identification of its personnel. Building code inspectors in several municipalities now provide cards to their clients for a contact point if any difficulties are encountered.

The final systems concept is *negative entropy*. What this refers to is the fact that entropic organizations exhaust all of their resources and eventually cease to exist. Negative entropy, obviously, is the reverse. This means that organizations will do whatever it takes to survive and, hopefully, grow. This can be done through a variety of means—engaging in strategic alliances, finding a partner, merging resources with another enterprise, and the like. Indeed, the classic example is the March of Dimes. It was originally established in the 1950s to cure polio, which, at the time, was a serious illness affecting the population. A cure (i.e., vaccine) for polio was developed and the disease was eradicated. The March of Dimes, based on its mission, should have ceased to exist. Rather than terminating the organization, those in the lead chose to broaden its mission to work toward the eradication of birth defects. In other words, it engaged in a form of goal displacement—broadening its mission and goal to capture new opportunities, funding sources, and additional constituents. In terms of governmental organizations, Henry Kaufman (1968) observed the same phenomenon. Kaufman examined several agencies over a period of decades and administrations. He found that, on balance, very few federal agencies were terminated. Rather, they were subsumed by other branches and divisions or changed their goal or mission (i.e., goal displacement) as a survival mechanism.

To summarize then, the concept of supply chain management is not something that is relatively new. While the specific name may be unique, its roots are embedded in a number of long-held concepts.

1. Origins of Supply Chain Management

The exact origins and roots of the concept of supply chain management are somewhat murky. Some professionals and academics trace its roots to the Malcolm Baldrige Award in which organizations developed several metrics related to total quality management and competed for national and international recognition. Others claim that national competitiveness was a driving factor—as the emphasis for public productivity became the touchstone of federal, state, and local governments. Still others feel that the concept was a fundamental strategic issue—one that could be applied to any organization, public or private. Indeed, this last observation probably has the most merit and is based on the works of Michael Porter (1983, 1985).

One of the issues that Porter raises is that the concept of supply chain management is misleading and implies that the focus of the organization should be on suppliers and vendors. Porter expands this notion to a concentration on *value systems*. As such, the organization looks at the broader concept of how to achieve value—upstream, internally, and downstream—consistent with the systems logic emphasis on holism and synergy. Value can also be viewed in broader terms. Indeed, Porter states that every facet of the organization should be providing value; if it isn't, it should be changed or eliminated. In considering any governmental organization, value could be several things: having skilled personnel, delivering a service in a timely or cost-effective manner, reducing waste or duplication, budgetary savings, and the like.

A value system can also be fairly simple or complex, depending on the organization. For example, if it is the Division of Parks and Recreation, the suppliers and vendors may be those that provide recreation equipment, nursery stock, etc. The Division then provides a variety of programs and services to multiple constituents, such as private individuals, school districts, or clubs. The value system becomes fairly straightforward and routine. Conversely, the Department of Health and Human Services would have multiple suppliers and vendors as well as a more complex set of constituents, such as individuals, Health Maintenance Organizations, nursing establishments, or businesses.

Embedded in value systems are *value chains*. The value chain consists of three primary areas: primary activities, support activities, and margin. The sector of *margin* is really the residual of both the support and primary activities. Simply stated, margin refers to the fact that whatever savings in efficiencies occur in either primary or secondary sectors, the savings go straight to the bottom line. In other words, it reduces your cost of operations—the lower the cost of operation, the greater the difference. For private sector organizations, this translates to margins which can either be passed along to the customer, reinvested in the enterprise, or paid as dividends to investors. For public organizations, the gain in margin presents a different scenario. This could mean that they will need to ask for fewer resources in the future, or the gains would revert back to the general revenue. Several years ago, the Public Works Department for the City of Detroit actually adopted the intriguing concept of *productivity bargaining*. Productivity bargaining, which was actually included in the collective bargaining agreement, referred to the fact that portions of whatever savings that were incurred as a result of productivity suggestions would be allocated both to the workers in pay increases and to the department. Two departments, solid waste disposal and snow removal, were cited as examples of this initiative. This concept also has roots in the notion of *gainsharing*, a concept popularized in the United States in the 1930s with the Scanlon Plan. Gainsharing received attention with the popularity of Japanese management techniques. Briefly stated, productivity improvement suggestions and gains are distributed both to the team that originated and implemented the suggestions as well as to the organization itself. This makes it an obvious win-win situation. In sum, then, margins are a result of adding value to the organization.

The other key sector in value chain management is *primary activity*. Primary activity refers to the core organizational activity. In the Department of Motor Vehicles, the primary activity is issuing licenses and titles. In the Internal Revenue Service, the primary activity is collecting taxes from individuals and corporations. Primary activities include: inbound logistics, operations, outbound logistics, marketing and sales, and service.

Inbound logistics refers to those value activities associated with getting and receiving raw goods and supplies. Drawing heavily from the concept of supply chain, a number of organizations have achieved significant efficiencies in this area:

The commercial airline industry, including certain manufacturers, suppliers, and airlines, are using leading-edge practices to improve logistics operations and reduce costs. Some manufacturers are providing aircraft parts to their customers on a just-in-time basis, and suppliers are assuming inventory management responsibilities for airlines and manufacturers ... In recognition of increasing budgetary pressures, the changing global threat, and the need for radical improvements in its logistics system, the Air Force has begun a reengineering program aimed at redesigning its logistics operations (US General Accounting Office 1996).

Recalling the earlier discussion on value systems, organizations are seeking to develop a strong relationship with their suppliers and vendors. This is in stark contrast to previous practices in which agencies put items out for bid. While often achieving low prices, quality was often sacrificed; and, ironically, more costs were incurred to correct the deficiencies in quality. Several value activities are possible in inbound logistics—ranging from certification of suppliers for Six Sigma, negotiating volume discounts, training suppliers, or having suppliers visit the organization. A few organizations, such as National Cash Register (NCR), have taken this one step further. Several years ago, NCR introduced the practice of *stakeholder alliances*. They would invite their key suppliers to the business and share their strategy for the future. This practice not only enabled them to forge a closer relationship, but it forced their suppliers to think of where they were going. If they wanted to do future business, they had to become a value-added partner and share ideas and suggestions for mutual benefit. There is nothing to prohibit this from taking place in the public sector. For several years, public entities had to place their supply and vendor needs out for competitive bidding. Many agencies have now changed this practice, and they now can engage in a no-bid contract as long as there is a demonstrated need for doing so.

Operations, the second activity in the primary sector, is what Porter refers to as the transformation phase. In this area, raw goods are transformed into a product and service. For most service organizations, e.g., public works, this is one of the more critical areas. In terms of specific value activities, it can involve several actions. Automating a process that was previously done manually is a classic transformation activity. Indeed, technology can also be leveraged here—witness the use of the Internet to do a variety of activities. Renewing driver licenses through the Web has allowed many jurisdictions to save dollars in staffing several offices. At the same time, individuals do not have to take time off or re-arrange schedules. The State of Colorado enhanced their air emissions program by providing drive-through portable monitoring stations, often located near a major highway intersection, for those renewing auto emissions tests. Rather than drive to one of a number of emission station locations, drivers can perform their emissions test on the way to work. Operations also involve a number of *quality assurance* and *quality control* activities. Indeed, many organizations have now shifted the focus from quality control procedures, whose emphasis was on monitoring and corrective action, to quality assurance. Quality assurance is more of an educational process in which employees are trained on the importance of doing it right the first time. It also seeks to empower employees to take corrective action on the spot and to be proactive.

Outbound logistics, the third sector in primary activities, involves the mechanics of delivering the product. For service organizations, this will usually entail payment for services already delivered in the operations stage. For others, this entails achieving efficiencies in packaging, tracking, and timely delivery. For private sector organizations, close ties with their distribution channels can give them a competitive advantage—witness the use of UPS and FedEx by many businesses to ensure on-time shipping and delivery. For the public sector, the United States Postal Service best emulates this—with different forms of express delivery, depending on the

needs of the client. Again, organizations need to clearly articulate their needs in the value delivery system.

Marketing and sales, the fourth sector in primary activities, is particularly unique in the public sector. Many critics feel that the public sector does not need to market itself—given the fact that it is a monopoly and has a captive constituency. In today’s environment of restricted resources and, in many cases, voter referendums and ballot initiatives, the need to be proactive in image management is a necessity. Value activities here may entail several actions. For example, a local Parks and Recreation Department may publicize the activities they provide for after-school hours and weekend events. In several states, a portion of revenue from lotteries is allocated to a number of public organizations. Therefore, states will actively market their respective lotteries. This can raise state governments to a different level of activity as they engage in active economic development activities—trying to attract various businesses. Or consider the various tourism ads that states are running to promote recreation and tourism in their locality.

Service, the final sector, should be expanded to include service and support. What this means is that once a service is provided, the organization’s involvement is not finished; it may still provide follow-up, complaint resolution, or further support. Many public sector organizations are beginning to realize that the support from their constituents can give them a competitive advantage in securing support as well as justifying future expenditures. One recommendation here is that there should be more proactive measures in this value activity. Rather than assume that the service is necessary, public entities should solicit formal feedback that can further assist service delivery.

The final sector of the value chain, *support activities*, typically is referred to as overhead. While many view this area as an added cost of doing business, a number of organizations have achieved value in this area as well. First of all, this area has a number of activities that are critical—human resources management, finance, accounting, procurement, research and development, and the like. The organization needs to determine how they can give greater value to their primary activities. In addition, several agencies have decided to outsource a few of their support functions—finding a partner who can provide the support service more efficiently:

Between now and 2007, the federal government will spend \$56 billion on outsourcing its information technology services. During this period, IT outsourcing is expected to grow 18% annually, from \$8 billion in fiscal 2002 to \$14.8 billion in 2007.... This involves a commitment from the program offices to performance-based contracting (Washington Technology 2003).

2. Practices and Applications

There is a robust and growing community of practices regarding supply chain management. Professional groups include the Supply Chain Council and the Institute for Supply Chain Management. Professional journals include the *Journal of Supply Chain Management*, the *Supply Chain Management Review*, *Supply Chain Management: An International Journal*, *Supply Chain Forum: An International Journal*, and *Supply Chain Systems Magazine*. Besides degree programs with specializations in supply chain management, there are centers and research groups focusing on supply chain management. For example, the Center for Public Policy and Private Enterprise at the University of Maryland includes as one of its program areas the modernization of government supply chain management. Another such center is the Supply Chain Management Research Center, which includes a number of topic areas related to supply chain management.

Adoption by government units has been more problematic. The shift to information-based supply chain systems in the public sector has met with more resistance and has moved far more slowly than in the private sector. *Transforming Government Supply Chain Management* (Gesler and Luby 2003) is an example of research directed to promote and enhance the adoption of supply chain systems in government. Korosec (2003) provides guidance in terms of identifying the components

of supply chain management and suggests how it may be used to enhance productivity in public procurement. Other countries are also making efforts to adopt supply chain management systems. For example, Parker (2005) assesses the acceptance of e-procurement in the public sector in Great Britain, while Stringer (2004) examines the challenges faced by the National Health Service in Great Britain.

3. Future Trends and Implications

Clearly, supply chain management is not a fad that will quickly disappear. As previously mentioned, it is imbedded in a number of critical activities and processes. Public sector managers need to make a concerted effort to do the following:

Educate employees and stakeholders. One of the cardinal principles of any quality improvement effort is that people need to understand what quality and value look like. Most people tend to view it either in terms of financial returns or cost savings. It is much broader than this. It can include quality in our operating systems, the people that are hired, skills training and development, the manner in which we are structured, and similar efforts.

Closely examine the current processes and systems. Too often, we assume that the current delivery system is the only way or manner in which the process can be done. Many organizations and agencies are re-examining this and are seeking to explore new delivery systems—witness the use today of the Internet to replace the method of many transactions. This is not to imply that this should replace human interaction. Yet, it can be utilized to enhance many functions and activities.

Institute changes quickly and openly communicate. Whether it is re-engineering, total quality management, or supply chain management, most professionals advocate that radical changes should be made quickly, rather than drawn out over a protracted period of time. This accomplishes several objectives. First, employees realize that management is indeed serious about making significant changes to current organizational processes and systems. Second, if the change is made quickly, employees will not be able to resist such change or wait it out. Finally, open communication about the broader context that requires the change will allow employees to understand the motivating factors. Absent this communication, there is a tendency to develop wild fantasies and motives—based on false information.

Continually assess and evaluate activities. Finally, any manager must view supply chain management as a continuous process—in which activities are examined constantly for further improvement. Many managers make the mistake of seeing this as a one-time effort that the organization engages in. Rather, employees must always look for further ways in which activities can be improved and ways to add (rather than subtract) value. The organization must also be willing to experiment with change and innovate. If it works fine the first time, that is great. If not, one should evaluate what didn't work and learn from it.

B. KNOWLEDGE MANAGEMENT

Knowledge management (KM) is not a single algorithm or a simple linear process for making decisions, but it is a concept or tool that is becoming increasingly recognized as valuable and useful for organizations. KM might be thought of generally as an array of strategies or tools to capture, protect, and expand what is being recognized as the most valuable asset of organizations, the intellectual capital or knowledge in the organization. The techniques in use are often associated with e-government and new digital technologies. The core idea, like many other decision-making tools, however, is not entirely new. Any good organization has always recognized the importance and value of preserving and expanding the know-how of those in the organization. But knowledge was typically not treated as a fundamental asset like capital and labor. Today, however, there is growing awareness that the funded experience and knowledge of those in the organization is perhaps the most important asset, and that systematic efforts should be taken to protect and enhance this knowledge asset.

1. Definitions and Elements

As far back as 1975, the *Public Administration Review* published a symposium on KM, in which the authors stated, “The authors share a conviction that man’s ability to manage knowledge is of central importance in contemporary public administration” (Carroll and Henry, 567). Many have provided various definitions and statements to capture the basic idea in either business or government contexts.

The editors of *Knowledge Praxis* state:

At *Knowledge Praxis*, we define knowledge management as a business activity with two primary aspects:

- Treating the knowledge component of business activities as an explicit concern of business reflected in strategy, policy, and practice at all levels of the organization.
- Making a direct connection between an organization’s intellectual assets—both explicit [recorded] and tacit [personal know-how]—and positive business results (Barclay and Murray 2006).

In practice, knowledge management often encompasses identifying and mapping intellectual assets within the organization, generating new knowledge for competitive advantage within the organization, making vast amounts of corporate information accessible, sharing of best practices, and technology that enables all of the above—including groupware and intranets.

Several concepts or elements are useful and important for understanding knowledge management. The concepts are discussed in various contexts, but the following are drawn largely from Grover and Davenport (2001) and Zack (1999a, b).

Knowledge. Philosophers have engaged in debates and analyses as far back as Plato and Aristotle in terms of understanding knowledge, whether it is possible to achieve knowledge, different types of knowledge, and the process by which humans may achieve or approximate knowledge (central questions of epistemology). Sidestepping those debates, in the context of KM, knowledge can generally be understood at the end of a continuum that begins with data, moves to information, and then to knowledge as the highest and most complex terminus of the continuum. Data might be all the transactions, including date and time, for all payments of tax bills. Information can be thought of as the aggregation of the data in terms of general payment patterns of the public in terms of predicting revenue streams. Knowledge might be a broad understanding of the likely reasons for these payment patterns and the implications for cash flow in the organization.

Explicit and tacit knowledge. This distinction has its origins with the philosopher Michael Polyanyi (1962), but it has been notably applied to business by Nonaka and Takeuchi, among others (Nonaka 1991, 1994; Nonaka and Takeuchi 1995). *Explicit knowledge* is characterized by being able to be codified, documented, transferred, and shared. Examples of explicit knowledge include business plans, patents, customer lists, procedure manuals for employees, or product manuals for customers. *Tacit knowledge*, on the other hand, is more subjectively and subconsciously understood and applied. It is more difficult to articulate, formalize, and codify. It is developed more from direct and interactive experience and shared more from interactive conversation. An example might be how to effectively navigate a desired change in the organization, knowing all the subtleties and key players in the organization. KM tries to leverage both explicit and tacit knowledge in organizations.

Knowledge processes. Included here would be *knowledge generation*, or processes by which knowledge is created and acquired in the organization. *Knowledge codification* “involves the conversion of knowledge into accessible and applicable formats” (Grover and Davenport 2001, 7–8). *Knowledge transfer* can be considered the process by which knowledge is shifted from one group to another or from generation to application or codification.

Communities of practice. The idea here is that knowledge is generated by individuals who form communities with shared interests. Organizations are advanced by fostering such *communities of practice*, either formally or simply by creating environments where such creation and sharing can occur.

Knowledge markets. This concept simply recognizes that knowledge is an asset or a good that is valued, may be protected by its possessors in organization, and may be exchanged for other goods such as money, position, or even other knowledge in a barter-like arrangement.

2. Practices and Applications

KM is typically associated with information technology tools that increase collaboration and information sharing in organizations, but KM should perhaps be thought of as a business practice concept rather than a technology-based concept (Santosus and Surmac 2004). Moreover, because "... all new knowledge stems from people" (Grover and Davenport 2001), it can be argued that KM must fundamentally be about managing people rather than technology tools.

KM practices have focused on developing and using information technologies that relate to acquiring, categorizing, storing, and distributing knowledge in organizations. These KM tools might include collaborative tools for identifying and sharing knowledge in organizations. Categories of such KM tools include: "knowledge repositories, expertise access tools, e-learning applications, discussion and chat technologies, synchronous interaction tools, and search and data mining tools" (Santosus and Surmacz 2004). But to reiterate, all the practices are directed toward identifying, codifying, sharing, and utilizing knowledge in organizations.

One can categorize different organizational approaches to KM (Rubenstein-Montano et al. 2001). One approach is to distinguish between codification and personalization (Hansen et al. 1999). *Codification* involves those strategies to capture knowledge of those who possess it and formally codify the knowledge for others to use in the organization. *Personalization* strategies, on the other hand, involve leaving knowledge with those who possess it but creating systems, networks, or interactions that will provide for that knowledge to be transferred or exchanged when it is needed in the organization. Organizations may propose to adopt some combination of these approaches, as suggested for federal government agencies (Buchwalter 2000). Another way to think about KM approaches is to distinguish technology-based, culture-based, or information-based strategies (Alavi and Leidner 1999). The fundamental idea here is the relative emphasis that organizations adopt in managing knowledge, i.e., technology infrastructure, the culture and interactions of individuals, or the actual information or knowledge in the system.

It is estimated that the US government will increase spending at a compound growth rate of 9% on knowledge management products, growing from \$820 million in Fiscal Year (FY) 2003 to \$1.3 billion in FY 2008. The growth will occur to a great degree in the Department of Homeland Security, but the Department of State and the Department of Justice also plan heavy investments in KM (D'Alessandro 2003). The Department of Homeland Security is a natural fit for adopting KM strategies. Tools to share information and knowledge quickly become critical when responding quickly to terrorist threats. Other agencies face different kinds of reasons for adopting KM strategies. For example, there is an intellectual capital crisis in the federal government due to retirements, early retirements, unfilled vacancies, and hiring freezes (Barr 2000). Hence, KM becomes an important tool for stemming the flow of valuable knowledge from organizations, and by implication, from the public communities that depend on those government agencies. Various examples of KM strategies can be seen in government.

The US Navy created Navy Knowledge Online (NKO), which is an enterprise KM and learning portal that serves as a vehicle for sailors to find the information and knowledge they need to further their careers. The Social Security Administration conducted a survey of KM awareness as well as an audit that included a set of recommendations for improving KM in the organization

(Rubenstein-Montano et al. 2001). Not surprisingly, the recommendations incorporated technology-based, culture-based, and information-based strategies. The recommendations included: the possible establishment of a Knowledge Transfer Department, the creation of yellow pages of individuals with expertise in the organization, the formation of knowledge repositories of best and worst practices in the organization, and the establishment of a Knowledge Exchange as a way of creating communities of practice within the organization. Other efforts focus on establishing a formal position to champion KM.

One of the increasingly common organizational approaches is to create Chief Knowledge Officers (CKO) to oversee KM efforts in organizations. The first US government official to be given such a title was Dr. Shereen Remez, Chief Knowledge Officer of the General Services Administration (Yu and Hartman 2000). Such CKOs can be found at the US Coast Guard, Veteran Affairs, the General Services Administration, the military services, and some smaller agencies. Distinct from Chief Information Officers (CIOs), CKOs focus on leveraging the tacit and explicit knowledge in organizations, rather than record keeping and keeping hardware and software systems secure and up to date. Other examples of success for KM can be seen in government in the US and elsewhere around the world.

The Federal Highway Administration created a community of practice around the issue of rumble strips, the bumps on the sides of highways designed to reduce off-road crashes. At a cost of \$75,000 the FHA estimates that 50 crashes were prevented at a cost savings to society of \$2.6 million. The United Kingdom (UK) has developed a Knowledge-Enhanced Government strategy that involves the UK Knowledge Network. One use of the network has been the Networked Learning Communities, created by the UK National College for School Leadership. The purpose is to share learning, experiences, and knowledge among 600 schools in the UK (Neilson and McCrea 2002). The National Informatics Center in India is involved in steering information in over 500 districts. An Intranet portal (Offerings) was created to facilitate a knowledge sharing culture. The portal includes a search engine, a document-sharing feature, mailing lists, yellow pages that identify personnel with expertise, online chats, and other functions. Offerings is accessed by more than 3000 employees from over 600 locations (Misra et al. 2003). In Canada the Treasury Board Secretariat has created a position of executive director of Corporate Renewal and Knowledge Management. Among the activities is a notable meta-knowledge-like application. The organization consults with other knowledge officers around the world in terms of best practices and strategies for knowledge sharing and creation. One of their initiatives is the creation of a best kept secrets site (Nicholson-O'Brien 2000). Yet other applications have been to police practices in Singapore (Luen and Al-Hawamdeh 2001), as well as urban poverty (Hjorth 2003).

3. Benefits, Challenges, Keys to Success, and Further Sources

The benefits of successful KM can be many and varied. Benefits can include the following: fostering innovation through the free flow of ideas, improving customer service, enhancing employee retention, and streamlining operations and reducing the associated costs (Santosus and Surmacz 2004).

In terms of factors that are important for the success of KM, Han (2001) identifies effective leadership, the commitment of resources, alignment of KM with the organizational strategy, and a focus on people rather than technology as those that are most important.

Some challenges of implementing KM have been suggested by Santosus and Surmacz (2004). One challenge is getting employees on board. Asking employees to surrender their tacit knowledge can be a significant challenge, because it is this very knowledge that may make these individuals valuable in the organization. Another challenge involves allowing technology to determine or drive KM. As has been stated above, KM should be driven by the people and strategy of the organization. Yet there is a great temptation to simply implement a set of new technologies that may or may not be appropriate in creating an effective KM system. Another challenge is to keep KM evolving and

fluid. Knowledge is constantly changing in relation to the organization, and so there needs to be an attitude and system that embraces change and new knowledge, including systems to facilitate and capture knowledge.

Web searches will yield a considerable body of sites and sources. A resource recommended as the best resource site by *KM World* is WWW Virtual Library on Knowledge Management. Periodicals include *KM World*, *Knowledge Management Magazine*, *KM Review*, *the Journal of Knowledge Management*, and *Knowledge Praxis*. There is a growing wealth of information available related to this concept and approach that managers may find useful.*

C. e-GOVERNMENT

Since the mid-1990s, governments have been executing major initiatives in order to tap the vast potential of the Internet for the distinct purpose of improving and perfecting the governing process. Like the personal computer, the Internet has become an indispensable tool in the day-to-day administration of government.

Both government and industry today are waging a fierce inner battle to provide efficient and cost-effective services, solutions, and products to their respective customers (Association for Federal Information Resources Management 2001). To do otherwise in this cost-conscious era would be viewed by some as tantamount to failure—at a minimum it would certainly be subject to review.

Broadly defined, e-government can include virtually all information and communication technology platforms and applications in use by the public sector. For the purpose of this chapter, e-government is defined as: “utilizing the internet and the world-wide-web for delivering government information and services to citizens” (United Nations Division for Public Economics and Public Administration and American Society for Public Administration 2002).

1. Existing Environment

E-government is not about technology or hosting thousands of Web sites with millions of pages. It is about providing services and products to citizens when and where they want them. It is about creating greater efficiencies across government and about citizen access and government accountability.

Yet, e-government is replete with obstacles. First and foremost, funding is an issue—particularly when additional funds are being used to solve similar problems repetitively. Second, industry is offering expensive e-government solutions; given the constraint on most budgets today, finding discretionary funds becomes a Herculean task. Third, top management leadership has not done an effective job of articulating its vision as well as a clear set of priorities. The federal government has several e-government success stories, but unfortunately, they are relatively limited to accessing and sharing information. What are really needed are success stories where agencies are making the transformation to realize the potential of e-government.

The greatest return on e-government is realized when similar functions in an organization are combined and put online. Employees, customers, and business partners have easy access to the same information and systems are not duplicated for each division, bureau, or office. However, the primary obstacle to implementing agency-wide and government-wide electronic services and practices is the stove-piped organization of agencies. In addition, the business processes that agencies have created match those stovepipes (Association for Federal Information Resources Management 2002).

*Other Web sites include www.brint.com and www.kmresource.com (locating the Knowledge Management Resource Center), and www.km.gov, which is the official KM site of the US government, supported by the Federal CIO Council. For case studies and examples one might visit www.kmresource.com/exp_cases.htm that includes cases on the Tennessee Valley Authority the US Department of Defense.

The stovepipes are promoted through the congressional agency funding process, which only fund individual programs. This process does not promote cross-agency programs, which are typically the e-government services and practices. In addition, incentives—such as financial rewards or performance measures—for government employees to reach across stovepipes to work with colleagues on e-government services do not exist.

In five years, agencies will be less bound by stovepipes and better able to work more easily with colleagues to develop and deploy electronic services and applications. This collaboration will be facilitated by a capital funding process that allows cross-agency, cross-government e-government functions to be created and funded.

To transform the organizational structure so that e-government implementation is more successful, the Federal government must institute a combination of employee and managerial rewards for those who encourage out-of-the-stovepipe e-government application development. New organizations that permit cross-agency funding for e-government solutions should be created. Stovepipes are institutionalized, and only with strong incentives and recognition will the obstacles be removed.

One suggestion is to create a clearinghouse for e-government projects. These projects would be thoroughly analyzed and funded. This clearinghouse would help determine which projects would warrant funding, based on performance measures and capital planning mechanisms. Congress would have a corresponding group to discuss and analyze the proposals.

In general, there appears to be an insufficient number of qualified personnel at both the technical and management levels to accelerate the transition to e-government. This can be attributed to natural market forces; that is, such skilled personnel can receive higher compensation and benefits in the private sector. Further, most managers in the public sector (as well as the private sector) have not been able to keep pace with the rapid pace of technology. This is not an indictment of the system. Rather, most managers are dealing with the vagaries of organizational policies and procedures. Finally, the entire annual budget process and lack of local agency control also hinders transformation.

2. Practices and Applications

In spite of the various obstacles to the promise of e-government, the UN Global E-Government Readiness Report of 2004 ranks the United States at the top their list, based on the state of e-government readiness and the extent of e-government participation (Swartz 2005). Of the 191 member states assessed, Denmark and Great Britain followed the US, and generally the report concluded that governments worldwide had made rapid progress in terms of embracing e-government technologies. A case study in the UK details the process of constructing an e-government organization and the attendant issues related to constructing an e-government identity (Beynon-Davis 2005). Asian countries are moving forward with e-government initiatives. South Korea, for example, has begun an e-government for foreigners, available to both businesses and individuals by 2007 (Swartz 2005).

In terms of e-government initiatives in the US, it is estimated that \$4 billion was spent on e-government solutions in 2004 (Aitoro 2005). And that amount is expected to skyrocket, one estimate putting the increase at 38% by 2009 (Public Administration Times 2005). Yet, in spite of such spending, a study by Brown University found that issues of broken links and accessibility were all too common (Aitoro 2005). At the local level there are initiatives to make digital cities. An interview with the chief financial officer of Virginia City Beach, Virginia, revealed various initiatives both to cut costs and improve government efficiencies. However, once moving in the e-government direction, one of the liabilities is that expectations increase and demand for IT is outstripping their ability to deliver. Virginia Beach alone is operating some 4000 computers and 250 software packages (McEachern 2005). Other studies examine issues such as the usability and accessibility of e-government to different populations. For example, one project looked at

web pages for 50 state and 50 federal agencies, in terms of potential barriers for older adults (Communications of the ACH 2005).

Interest in e-government has spawned a series of articles on E-Government II in the *Bulletin of the American Society for Information Science and Technology*, including topics regarding best practices for digital government (Brueckner 2005), best practices in Michigan local government (Hammerman 2005), user-centered design for e-government software (Boersma 2005), and impact on openness, transparency, and interactivity (Porte 2005). The impact of e-government on citizen trust and democratic institutions is a crucial issue for the design and implementation of e-government strategies (Carter and Belanger 2005; West 2004). And the International City Managers Association (ICMA, 2005) has conducted a survey of cities and counties on their e-government initiatives. Because of the disparate initiatives and lack of structure, some have argued for and offered a framework for assessing, categorizing, and comparing e-government initiatives (Grant and Chau 2004). Others have begun to examine the general benefits and advantages of e-government (Foley 2005) and the effect on democracy or the movement toward e-democracy (Maher and Krimmer 2005).

There are numerous government and private organizations emerging to deal with issues related to e-government. The Center for Digital Government, for example, is a national research and advisory institute focused on information technology policies and best practices in state and local government. The University of Southern California has a Center for E-Government that publishes the *Journal of E-Government*. There is a President's Management Council Subcommittee on E-Government. The Cyberspace Policy Research Group (CyPRG), at the University of Arizona, Tucson and George Mason University, "studies diffusion and use of World Wide Web in governments worldwide, particularly in terms of organizational openness and internal effectiveness" (Cyberspace Policy Research Group 2005). Other relevant publications include *Electronic Journal of E-Government*, *Government Computer News*, and *Government Technology Magazine*. The number of organizations and professional publications seems to be growing as fast as e-government itself.

3. Going Forward

A new wave of people with e-government experience will enter the public service. By 2007, the budget process will be modified at the federal level to provide multi-year funding for e-government initiatives, both internal to an agency and cross-agency. In addition, funding for e-government must become a priority. Once funded, and to prove that the money was well spent, matrices must be in place against which gathered data and results can be measured.

Up to this point, legislative actions such as the Government Performance and Results Act and the Government Paperwork Elimination Act have not had a significant impact on successful e-government implementations. What is needed is concerted leadership. The technology is available; enabling of the technology is critical. Congress is still unsure of agency capabilities to properly execute an e-government vision. Agencies will have to develop and present a solid business case to aggressively pursue true transformational initiatives.

Immediate initiatives that should be implemented to resolve resource issues include hiring new managers who have a broad range of IT and organizational skills; increasing job exchange programs with industry; creating a mechanism to fund government/industry R&D e-business collaboration; and creating an Office of Management and Budget (OMB) centered working group comprised of agency change e-government agents.

D. COST-BENEFIT ANALYSIS

Benefit-cost analysis or cost-benefit analysis (the terms are frequently interchanged) is an analytical technique that has had a significant impact on decision-making in the public sector. One primary reason for this is that cost-benefit analysis forces managers to articulate the quantitative as well as qualitative aspects of a program or service. Naturally, this process has its limitations and these will be further addressed.

1. Origins

The exact origin of the use of cost-benefit analysis is generally considered to lie within the Army Corps of Engineers in which, according to the Rivers and Harbors Act of 1902, the cost of projects had to be less than the benefits (Meier 1984). The application of this technique to dam and reclamation projects tended to be reasonably straightforward with a clear articulation of the costs associated with actual construction and maintenance. These were subsequently balanced with current and future benefits, usually discounted back to present value. As to the effectiveness of this specific method, little evidence remains today.

Cost-benefit analysis remained fairly dormant until the post-World War II emergence of operations research and management science. It was at this stage that quantitative methods and techniques began to take hold and were applied to a variety of events and situations, ranging from scheduling issues to large-scale project and program planning. As Kenneth Meier notes, the second threshold event for the use of cost-benefit analysis was the formal introduction of program planning and budgeting systems (PPBS) in the federal government—beginning initially within the Defense Department and expanding, by executive order, to other federal agencies. Cost-benefit analysis was frequently used to either justify the expansion/continuation of *specific* programs or make trade-off decisions.

With the phasing out of PPBS after the Johnson administration, the use of cost-benefit analysis became largely dormant until the Carter and Reagan administrations. Two critical events signaled its return. The first was the Federal Paperwork Control Act of 1980:

The Paperwork Control Act was intended to correct a number of deficiencies in information *management*. Specifically, it attempted to reduce the burden of information processing on the public and private industry by implementing standards for collecting information (for example, prior approval by the Office of Management and Budget of agency forms). In addition, it established an Office of Federal Information Policy in the OMB to monitor and direct, if necessary, information practices by government agencies (Stevens and McGowan 1985).

With the passage of this legislation, agencies had to carefully assess and justify the paperwork cost of compliance associated with their program or service delivery function.

The second event during this time was the establishment of the Regulatory Analysis Review Group (RARG), which was intended to examine the effects of federal regulation, particularly as it affected smaller businesses. Formed in 1978, RARG represented a concerted effort on the part of the executive branch to exercise control over agency regulatory activities by requiring agencies to formally document and justify new regulations *prior to implementation*. Yet it was not without detractors:

For their part, critics [of RARG] feared the effects of the new supremacy of economists who, they felt, were bound by their discipline into a new rigidity in which “sound analysis” was equated solely with economic analysis. Capitulating to the RARG standards of balancing costs against benefits meant viewing regulatory policy strictly through the context of White House economists, and in that framework, they predicted, cost factors would invariably take precedence over social concerns (Tolchin and Tolchin 1983, 49–50).

As Tolchin and Tolchin go on to explain, the position taken by most critics was that the use of cost-benefit analysis could be supported in selective areas where benefits are difficult to articulate. Under this approach, benefits that cannot be quantified, and subsequently justified, are eliminated from the analysis, resulting in least-cost analysis. Tolchin and Tolchin (1983) cite such extreme examples as attempting to assess the value of the view of the Grand Canyon. Regulatory agencies are now placed in the defensive position of attempting to quantify program areas or elements that involve a high degree of subjective judgment.

Following this effort to use cost-benefit analysis in the regulatory arena are two additional key pieces of legislation: Public Law 96-354, "The Analysis of Regulatory Functions," and Executive Order 12291 (1981). Public Law 96-354 was passed in 1980 and represented an effort by the Carter administration to provide regulatory relief to small entities (i.e., small business). It is significant to the extent to which the OMB is granted direct oversight control of agency regulatory functions and is further charged with ensuring the application of cost-benefit analysis.

Crucial portions of this law include the requirement that agencies must publish a regulatory flexibility agenda in the *Federal Register* twice a year. The purpose of this agenda is for the agency to announce forthcoming rules that are "likely to have a *significant economic impact* on small entities." In addition, regulatory agencies are required to conduct a "regulatory flexibility analysis," which includes: (1) a statement of the need for the rule, (2) a summary of the issues related by public comments, and (3) a description of significant alternatives to the rule that are designed to *minimize* any significant economic impact. Finally, in preparing the flexibility analysis, the agency must provide either a "quantifiable or numerical description of the effects of a proposed rule...or more general descriptive statements if quantification is not practicable or reliable" (Public Law 96-354 1980). The latter descriptive statements have been strongly contested in agency hearings and court proceedings.

Executive Order 12291, which was signed by Ronald Reagan on February 17, 1981, closely followed Public Law 96-354. Also intended as a device to reign in regulatory agency activities, it clearly signaled to executives the approach that was to be adopted. The critical section (Section Two) requires agencies to consider the following when issuing new regulations:

1. Decisions shall be based on adequate information concerning the need for and consequences of proposed government action.
2. Regulatory action shall not be undertaken unless the potential benefits to society from the regulation outweigh the potential costs to society.
3. Regulatory objectives shall be chosen to maximize the net benefits to society.
4. Among the alternative approaches to any given regulatory objective, the alternative involving the least net costs to society shall be chosen.
5. Agencies shall set priorities with the aim of maximizing the aggregate net benefits to society, taking into account the condition of the particular industries affected by regulations, the condition of the national economy, and other regulatory actions contemplated for the future.

Parts three and four above are the critical areas. The executive order not only required agencies to seek to maximize benefits, but they must take into consideration least net costs *at the same time*. The implications of this are clear; a cost-benefit ratio of 1:2 must take precedence over a 2:6 ratio even though the yield of the latter is on the order of threefold as opposed to twofold. In this case, cost considerations are paramount.

2. Applications

The process of applying cost-benefit analysis tends to be fairly straightforward. As Meier (1984) notes, this involves approximately three steps. First, the impacts (direct or indirect) of a program or service are determined. These are generally classified along the lines of either benefits or costs and are subsequently defined as direct (first-order) or indirect (second-order). Let us take, for example, the reduction of air pollution in a metropolitan region. Without listing all possible benefits and costs, a number of principal ones come to mind. The reduction in the number of lung-related incidents could be classified as a direct benefit. The improved health, as a result of the reduction in air pollution, would also translate to such second-order impacts as lower absenteeism and higher productivity.

On the costs side, the immediate costs of compliance (e.g., installation of emission control equipment, oversight, and enforcement) are usually considered first-order costs. Second-order costs may include lost companies or employment opportunities as businesses are either forced to close, move out of the region, or fail to locate in the area as a result of the enforcement program.

Second, a dollar estimate of each benefit and each cost is made. For most costs and benefits, a market price is assigned; those that will occur in the future are subsequently discounted using present-value techniques. The purpose of this technique is to determine what today's dollar investment will yield in the future. In addition, the opportunity costs of investing in the particular program or service should be reflected. This generally refers to the *other* opportunities for the use of those funds which would be foregone as a result. For example, the opportunity costs of the expenditure of \$250 million for a dam project would perhaps include \$50 million for expanding the power generation capabilities of another existing site.

Perhaps one of the most controversial aspects involved in the assignment of dollars to cost-benefit analysis revolves around the benefits for which there is no clear market value. Here, Meier (1984) suggests several remedies. First, so-called shadow prices can be assigned. Such prices are used when a competitive market does not exist, and the prices are generally higher when the market is subsidized, lower when the market is oligopolistic. So a dollar value is assigned that is either slightly higher or lower than in a competitive market—thereby shadowing the competitive market condition. Another technique is the assignment of value based on a public good. The public good associated with the building of an outer-loop interstate system may be less central-city congestion and, as a consequence, lower rates of automobile accidents.

Finally, certain benefits defy such efforts to be quantified yet are an integral part of the analysis. In our earlier example of the reduction of air pollution in a metropolitan region, a major benefit is improvement of the overall quality of life. Although this concept has as many definitions as people who are asked, it is a factor that must be considered. There are a number of unobtrusive ways of measuring this—ranging from selected neighborhood surveys to determining willingness to pay on the part of the citizenry (Hatry et al. 1973; Webb and Hatry 1973). Unfortunately, this last element has been the most controversial, as previously discussed.

An example of employing cost-benefit analysis is whether to raise federal excise taxes on alcoholic beverages. Adverse effects of alcohol consumption could be improved by raising taxes (cost). Higher taxes should decrease consumption, which will lead to fewer highway fatalities, nonfatal injuries, and reductions in health and productivity losses (benefits). This analysis can be found in “An Illustration: Taxing Alcohol to Save Lives” (Weiner and Vining 1989).

3. The Future of Cost-Benefit Analysis

It is difficult to fully address the subtleties of a technique such as cost-benefit analysis. As with any technique or tool, its usefulness comes from the extent to which it is commonly accepted and used. Cost-benefit analysis is not without its critics, and there are those who see its use as one of attempting to limit agency power. Regardless of one's position, there is little doubt that the contribution of cost-benefit has been dramatic (Tolchin and Tolchin 1983). It has challenged public administrators to examine both sides of a program or service, to look at the long-term effects, and finally, to articulate its impact in quantitative as well as qualitative terms.

E. STRATEGIC PLANNING AND MANAGEMENT

Strategic planning has been considered one of the hot innovations in public and nonprofit management (Berry and Wechsler 1995). While strategic planning and strategic management may be used interchangeably, one can distinguish strategic management as the implementation of strategic plans or the outcomes of strategic planning. Whether planning or implementing, a strategic approach will

take a systems perspective by examining essential functions and goals, by analyzing the internal and external conditions and forces on an organization, and by assuming a decision-making framework that uses a time horizon of 1–5 years.

The term strategy has ancient Greek origins having to do with leading an army. What is conveyed by the term is the “idea of critical goals achieved under battle conditions” (Anderson 1994, 339). Business and government managers face some similar issues. They both function in increasingly turbulent environments, both have to manage external and internal conditions, both must design systems and determine directions to achieve goals and objectives. Yet, there are important differences. For business managers the battlefield can be thought of as the marketplace of competition for customers, while government managers compete for a limited pool of public funds. If government agencies follow a competitive business approach, it can lead to “inefficient turf-protecting behavior rather than to better, more cost-effective services” (Anderson 1994, 340). This fundamental difference can have significant impacts on the appropriate model and approach to strategic planning.

1. Definition and Essential Elements

Various definitions have been offered from a variety of sources, including:

Strategic planning is defined as a systematic process for managing the organization and its future direction in relation to its environment and the demands of external stakeholders, including strategy formulation, analysis of agency strengths and weaknesses, identification of agency stakeholders, implementation of strategic actions, and issue management (Berry and Wechsler 1995).

Strategic management is ... the process for implementing a strategic plan which integrates the organization's goals, policies, and action sequences into a cohesive whole (Halachmi 1992).

... we define strategic management as a disciplined effort to produce fundamental decisions and actions that shape and guide what an organization (or other entity) is, what it does, and why it does it (Bryson 1989).

Regardless of the specific definition one finds most appealing, there are several elements that any strategic planning approach will contain. We have chosen to focus on three of them.

Assessment of the external environment. Strategic planning will involve an environmental scan that examines the opportunities and threats to the basic mission and goals of the organization (Eadie 1983; Halachmi 1992). Given the turbulent conditions of most organizational environments, the strategic approach will systematically assess the conditions that provide new opportunities or pose new threats to the accomplishment of fundamental goals, if not basic survival, of the organization. This often involves examining the broad economic, political, social, and technological trends influencing developments in today's environment. For example, a university will monitor demographic trends, changing job profiles, and new entrants or competitors in the market.

Assessment of the internal environment. Strategic planning will also involve an assessment of the organization in terms of its strengths and weaknesses. This can be thought of as a resource audit that analyzes the particular assets and liabilities of the organization as they relate to the strategic choices and actions contemplated (Eadie 1983). Such information becomes essential if the choices and implementation of future directions are to be successful. For example, a decision by a university to develop a new degree program without adequate faculty expertise or the resources to acquire expertise in the needed areas is destined to failure. Strategic planning should identify such needs before making such program changes.

Selection of strategic objectives using a systems perspective. Given an awareness of the environments of the organization and a sense of the basic function or purpose of the organization, choices about specific courses of action can be made so that there is a better fit between the organization and the environmental realities. For example, regarding the situation mentioned above, rather than decide to expand degree offerings, a university may redesign the curriculum of an existing program in order to respond to the need for change while drawing upon particular assets of its faculty.

Though we have mentioned only three essential elements, there are other elements of strategic planning and management. For example, another element of strategic planning might be the identification of fundamental goals or a reassessment of the basic mission of the organization. Some argue for goal definition as part of the strategic planning process (e.g., Steiner 1979), while others argue that goal selection and strategy formulation should be separated. Differences between government and business must be considered, however. The ability to change mission in the public sector is more problematic in the public sector because managers are not in a position to make changes in fundamental goals (Stevens and McGowan 1983).

Another analysis (Anderson 1994) identifies five features of a strategic orientation, suggesting that the government or business organization would be: (1) concerned with mission-critical activities, (2) long range in time orientation, (3) looking outward from the organizational boundaries to stakeholders or customers, (4) seeking maximum return on investment rather than minimum economic cost, and (5) placing a high value on technological, human, and information resources.

Strategic planning has emerged as a widely used management tool, with increasing numbers of government agencies adopting some form of strategic planning. Strategic planning is being used at all levels of government. Independent surveys of both municipal managers and state agency managers reported very similar rates of use. Approximately 60% of managers at both state and municipal levels of government reported using some form of strategic planning (Berry and Wechsler 1995). Strategic planning and management has also been aligned with the role of government managers as leaders (Moore 1995).

Citing but a few examples of applications in the public and nonprofit sectors of strategic planning, we include: local economic development (Liou 2000); the development of information technologies in the public sector (Andersen 1994); strategic management at EEOC (Kemp, Funk, and Eadie 1993); city and county planning (Sorkin, Ferris, and Hudak 1984; Thomas, Means, and Grieve 1988; Wheeland 1993); performance measurement and human resource management (Kerr 1994); and applications to nonprofit or third sector organizations (Nutt and Backoff 1992).

2. Approaches to Strategic Planning

While there are common elements of strategic planning, a variety of approaches have been developed. Bryson (1989) has summarized the major private sector approaches to strategic planning. He divides these approaches into process and content. Content approaches include:

1. *Portfolio methods.* Various business of the company is assessed in terms of strategies in relation to each business or part of the portfolio (e.g., MacMillan 1983).
2. *Competitive analysis.* Key forces that shape the business are assessed in terms of developing strategic options (e.g., Porter 1985).
3. *Strategic issues management.* The focus here is on identifying issues that can have a major influence on the business. Strategy development becomes selecting effective ways of managing those issues (e.g., King 1982).

Process approaches, on the other hand, include:

1. *Harvard policy model*. This approach uses strengths, weaknesses, opportunities, and threats (SWOT) analysis, identifying the strengths and weaknesses of the internal elements of the organization, while examining the external environment for opportunities and threats to achieving organizational goals (e.g., Andrews 1980).
2. *Strategic planning systems*. Here managers generally make important decisions across functions and level of the organization. The focus is thought to be on mission, strategies, budgets, and control (e.g., Lorange and Vancil 1976).
3. *Stakeholder management*. This approach identifies critical stakeholders (internal and external) and formulates strategies to deal with each stakeholder group (e.g., Freeman 1984).
4. *Strategic negotiations*. Bargaining and negotiating are used as a process among players for identifying and resolving strategic issues for the organization (e.g., Pettigrew 1977).
5. *Logical incrementalism*. This approach focuses on the importance of small changes in developing and implementing strategies for the organization (e.g., Quinn 1980).
6. *Frameworks for innovation*. The emphasis here is on innovation as a strategy (e.g., Taylor 1984).

As discussed by Galloway (1990) the analysis of the current situation is critical in beginning a meaningful strategic plan. Galloway cites Floyd and Palmer (1985), who argue that a strategic plan should begin with a descriptive account of the mission, objectives, and strategies that characterize the organization. This approach insures that planners begin with how the organization is actually operating, rather than considering what the organization should be without a context. Moreover, they argue for involvement of staff in the early stages of developing a strategic plan. Such an approach emphasizes the importance of maintaining a reality check on what actually characterizes the organization and the importance of involvement and buy-in from employees and staff.

Based on his review of private sector approaches to strategic planning, Bryson draws several conclusions concerning strategic planning in the public and nonprofit sectors. First, strategic planning is not a single concept, procedure, or tool. Second, public sector strategic planning will have to allow for a wide range of planning activities. Third, strategic planning should be tailored to the situation, usually creating a hybrid of other approaches. Fourth, all public and nonprofit planners should possess an awareness and knowledge of strategic planning tools and approaches. Fifth, planners should encompass both the technical and political sides of issues. Sixth, research is needed to increase knowledge of strategic planning in the public and nonprofit sectors.

Bryson (1989) does present a general approach that combines aspects of the private sector approaches discussed above. He presents an approach that he believes is appropriate for public and nonprofit organizations. This approach includes the following eight steps: (1) initiating and agreeing on a strategic planning process, (2) identifying organizational mandates, (3) clarifying organizational mission and values, (4) assessing the external environment: opportunities and threats, (5) assessing the internal environment: strengths and weaknesses, (6) identifying the strategic issues facing an organization, (7) formulating strategies to manage the issues, and (8) establishing an effective organizational vision for the future.

In one other approach, Halachmi (1992) identifies seven steps in a simple model of strategic planning: (1) developing the plan, (2) taking stock, (3) strategic analysis, (4) alternative generation, (5) strategic choices, (6) organization leadership and support, and (7) review and evaluation. Public sector organizations may have to tailor-fit their particular approach to strategic planning and management, especially because many of the strategic approaches were developed for business applications. For example, Andersen (1994) modifies Porter's competitive strategic analysis by developing a collaborative model of analysis that includes providers, clients, entrants, and

substitutions in the service environment. Andersen then combines this collaborative analysis with another business approach, the strategic options generator (Wiseman 1985), in creating a strategic approach suitable for public information management applications to public organizations. Hendrick (2003) provides an account of implementing strategic planning at the city level in Milwaukee. Llewellyn and Tappin (2003) explore the growth of strategic planning in the national parks. Irwin (2002) explores the use of strategy mapping and Balanced Scorecard in a public agency. And Kloot and Martin (2000) relate strategic plans and performance measures.

The important point here is that there are a variety of approaches to strategic planning and management, and creative modifications may be necessary for applications to public organizations, depending on the level of government, the kind of service provided, and other relevant factors. Poister and Streib (2005) studied the use of strategic planning in municipal governments of over 25,000 in population. While they did not find a significant increase in the use of strategic management, there was some evidence of a growing sophistication with regard to using strategic planning. Moreover, many European states are now using strategic planning among local governments in their efforts to coordinate and democratize local government (Abram and Cowell 2004). Yet Stewart (2004) argues the strategic management remains under-theorized in the public sector because the issues raised relate to different fields of analysis, namely the political, the policy-related, and the managerial.

V. CONCLUSION

Attempting to identify and summarize five tools in decision-making is a challenging but interesting task. Others would, no doubt, have a different list of decision-making tools and frameworks. Perhaps the key underlying feature of these tools is that they are all created to assist the decision making process to arrive at sound, rational decisions for the organization and its stakeholders. In an environment of constant change and challenge, no single aid for decision-making will be adequate. Managers will need to assess the strengths of various approaches and be prepared to custom design their own particular models and approaches for organizational success (Johnston 1995).

I. INTRODUCTION: DEVELOPMENT OF THE PUBLIC SERVICE

The United States public service reflects changing values and concerns of the society as a whole. Shifts in social, economic, and political values influence the issues addressed in the personnel system. To understand the dynamics of public personnel management, it is necessary to understand the basic ideals that underpin public personnel policy making. Therefore, the public service as it evolved from the beginnings of our federal system of government will be examined.

A. 1789–1800: THE FEDERALIST PERIOD

In establishing his administration, President George Washington had the opportunity to create a new public service. While precedents from the Articles of Confederation experience certainly played some role, the new administration actually had little to guide it. The pressures of pulling together a new nation and getting the government off to a strong start dictated some of the decisions that had to be made. Thus, the first administration made efforts to include those who were politically

important and accommodated interests of the Congress, Revolutionary War veterans, and others who had a stake in the workings of the new government (Ingraham 1995; Kaufman 1965; Mosher 1982; Van Riper 1958).

One of the most elementary credentials for serving in the public service was support for the new political system. Thus, Washington appointed fellow Federalists to the public service. While there was no strict test of political views, the administration obviously needed to assure that its employees would not be working to undermine the new system. During the administration of John Adams, partisan politics became more important. Because of some conflicts within Federalist ranks and with the differences developing between the Federalists and the Jeffersonians, President Adams experienced pressure to consider partisan politics when appointing or replacing public officers (White 1948). Still, during the first twelve years of the new nation, partisanship played a minor role in public service staffing decisions (Kaplan 1940).

More important than partisan politics was social status. The Federalist public service clearly represented the aristocracy. As Leonard White (1948) notes, Washington had a very high standard of fitness for his appointees. However, fitness did not relate entirely to the ability to do the work. Instead, fitness also included such things as standing in the community as evidenced by having held other offices in the person's community. Place of residence also mattered, as did service in the Revolutionary War.

All of these considerations were calculated to bolster public support for the new government. Because the aristocracy held political power, appointing members of the aristocracy to government service was an effective way of gaining their support. Similarly, appointing people from all regions of the country facilitated attempts to assure the allegiance of disparate parts of the new nation. These very pragmatic considerations of President Washington are enduring elements of the personnel system (Van Riper 1958). Many of these considerations were formalized in law or civil service policy later.

Because the Republican Party competed strongly in the 1796 elections, President John Adams faced more purely partisan concerns than Washington ever did. Consequently, Adams looked more closely at political party affiliation as a criterion for appointment to office. While Washington was sensitive to the issue primarily at the highest levels, Adams carried the concern to lower levels of the public service. Attention to partisanship in selection became so intense that the Republicans began to protest what they considered discrimination against them (White 1948).

The Federalists and Republicans also clashed on the level of pay for public servants. While the Federalists favored paying public officials a salary, which would take into consideration the need for leaving property and income behind and establishing residence in the capital, the Republicans supported a more parsimonious approach. Neither side won clear-cut victories in the dispute, and commentaries of the time indicated that public servants felt underpaid.

B. THE JEFFERSONIANS: 1801–1829

The election of Thomas Jefferson in 1800 represented the first succession of power from one political party to another in United States history. Not surprisingly, some partisan issues surfaced in staffing the public service. Thomas Jefferson inherited a public service filled with Federalists whom his party had just defeated in the election. Members of his own party wanted opportunity to serve (White 1951). As a result, Jefferson had to find some way to staff the government with employees more sensitive to his political concerns. At the same time, he did not seem interested in a complete overhaul of the public service.

To deal with the dilemma of making government more responsive to his party while maintaining some stability, Jefferson developed the doctrine that there should be a balance between the political parties in offices held (Van Riper 1958). Of course, he wished to be able to appoint members of his own political party to office and did so in a modest fashion. He began by removing

high-level officials and replacing them with Republicans. The removals and replacements continued until 1803, when he achieved a balance to suit his views.

Aside from the partisanship issue, Jefferson used standards similar to the Federalists. People appointed to public office still reflected the aristocracy and powerful elements of society. During Jefferson's administration, agricultural interests seemed to fare better in representation. Otherwise, his appointments were strikingly similar to the Federalists in coming from the gentleman class. Most appointees just happened also to be Republicans.

Jefferson also introduced the first cutback management in personnel (Van Riper 1958). The Republicans distrusted big government and attempted to reduce the size of government by not filling positions and by consolidating others. While their efforts were not entirely successful, they established a precedent followed by many administrations since. The growing nation and expanding government activity made their efforts short-lived.

Madison and Monroe followed the Jeffersonian tradition of appointing people from the upper classes and generally favored Republicans. However, because partisan activity was declining during this period, there was less of a sense of urgency to partisan representation. Prior to the Madison and Monroe administrations, Jefferson had balanced the public service in favor of Republicans. One significant development during this period was the passage of the Four Years Law of 1820 (also referred to as the Tenure of Office Act of 1820), which limited the terms of public officials to four years. The effect was to open the doors to new appointments for each president. Both Madison and Monroe tended to reappoint incumbents as their terms expired.

John Quincy Adams came to office with a very divided electorate and electoral college. As a result, he was under great pressure to satisfy varying political factions. He was insistent on maintaining the same principles that had guided Washington and Jefferson in appointing people to office. Thus, he insisted on fitness for office and continued to choose from the upper socioeconomic groups when appointing public servants. His resistance to political pressures did not broaden his political support, and the stage was set for the election of Andrew Jackson and a major change in the public service.

During the Jeffersonian period, predecessors of the union movement in the public sector also emerged. Surgeons and assistant surgeons in the United States Navy became so disenchanted with their pay and working conditions that some of them got together and sent a petition to Congress for relief in 1828 (White 1951). Similarly, Army captains sought higher pay in 1826 with a petition to Congress. In 1918, Congress created the Provident Association of Clerks to provide for families of deceased members of the organization. As a benefit association, it performed many of the functions unions would later perform. As White (1951) indicates, these organizations had economic interests and represented attempts to secure their interests in a fashion similar to those of unions of the present day.

Pay remained relatively low during the Jeffersonian era, especially because the Federalist party dwindled away and there was little formal opposition to Republican policies. Despite low pay, the public service seems to have been remarkably free of corruption and collusion during this and the Federalist eras. The focus on fitness for office as defined by the early presidents appears to have been effective in assuring that public servants were of high integrity. Government service was truly a respected calling during our early history (Goodsell 2003; Newland 1984b).

State and local governments went through many of the same experiences as the national government. In some instances, the state and local governments led the way. Such is apparently the case regarding the more partisan considerations used in the appointive process. While most of the states used the model of staffing the public service with the aristocracy, some of them were much more specifically partisan in their approach (Fish 1905). New York and Pennsylvania, in particular, started using the spoils system during the first decade of the nineteenth century. Although they used Jefferson's justification for balancing the service, they demonstrated none of the restraint implicit in his approach. New York and Pennsylvania were models of what the national level was to experience in the middle of the century.

Along with the patronage issues, the Congress and president competed for control over the public service during the 1820s. Senator Thomas H. Benton (US Senate, 1826) set the tone for the conflict with his recommendations for curtailing executive control over appointments and removals. Specifically, he recommended that the president be required to justify the removal of officials, Senate confirmation of postmasters, and apportioning appointment of cadets and midshipmen by Congressional district and state.

C. THE ERA OF SPOILS: 1829–1865

The aforementioned development of spoils in state and local government during the early part of the nineteenth century enveloped the national government after the election of 1829. President Andrew Jackson came to office with the support of a much more varied electorate than any of his predecessors. Because the nation had by now grown to 24 states and was spreading westward, the nature of the electorate changed. Suffrage was extended to non-landholding men; thus, the upper economic class was not the only group voting. The rise of the Democratic party, based on the belief that the common man should be able to participate in government, provided the base of support for Jackson's administration.

Coming to office, Jackson found the system in which only the elite had access to public office offensive to democratic (and Democratic) ideals. Therefore, he favored making public service available to everyone, but especially to the common man. The result was a very strong justification for replacing office holders with partisan supporters. Jackson believed that his loyal supporters deserved the opportunity to serve in appointive positions. He also believed that public officers lost touch with their fellow citizens by being in their positions for too long (Ingraham 1995). Most importantly, he believed that the aristocracy had no right to a monopoly on government jobs (White 1954).

To remedy the situation he inherited, he proposed rotation in office, intending to implement the Tenure of Office Act of 1820 that his predecessors had not faithfully executed. He also appointed common people to government positions. While President Jackson is identified with rotation in office, the fact of the matter is that he did not remove a lot of incumbents. The evidence suggests that he removed perhaps 20%, but more likely no more than 10%, of all public servants during his administration (Crenson 1975; Eriksson 1927).

Even though the image of spoils in the Jackson administration exaggerates reality, his approach had very significant effects (Kaplan 1940; Mosher 1982). For the first time, the public service was democratized and reflected the interests and status of a large spectrum of American society (Aronson 1964). Because it was still only males who had the vote, women were not included among those who received public appointments to any significant degree.

While Jackson was restrained in his use of spoils, the fact that he used it so openly led to a great deal of criticism of his administration (Fish 1905). The nation was yet to see the worst of it. The election of 1840, in which Benjamin Harrison was elected president, only to die after one month in office, demonstrated that the Democrats were not the only ones with an interest in patronage. Hordes of office-seekers descended on Washington, establishing a trend that survived until the 1883 reform. Although Tyler, Harrison's successor, attempted to resist pressures for spoils appointments, he was unsuccessful, as electoral supporters of successful candidates considered public appointments a benefit due them for their support. Because of political instability and the rotation of the Presidency between the Democrats and Whigs until the 1860s, rotation in office was standard procedure. Even the election of a president of the same party as his predecessor did not protect public servants from removal and replacement.

The experience at the state and local levels was similar to that at the national level. As noted above, many states preceded the national government in the establishment of patronage. A notable exception to the use of patronage at the state level was in the South (Fish 1905). The landed aristocracy never lost its hold on politics in the South before the Civil War and thus was able

to forestall the march of spoils. It is ironic that the South later became a stronghold of patronage in the wake of twentieth century reform efforts.

The spoils system came under severe criticism, even during the time when it was at its zenith. Spoils were dysfunctional to the public service over the long term. While the early use of spoils democratized the public service and gave the common people access to government jobs and decision making, later experiences were not so beneficial. The constant rotation of people in office led to inefficiency in operation. The scandals associated with spoils also damaged the good image the public service had during the first forty years of our nation's history. Of course, the excesses of post-Civil War days also led to corruption and coercion of employees. At the same time, patronage is considered an important element in the success of the Union in the Civil War (Van Riper 1958; White 1958).

Despite the wide use of spoils during the Jacksonian era, some developments actually helped establish the base upon which our modern personnel system was built. The Jacksonians extended the use of examinations that began with the Jeffersonians (White 1954). By 1853, all Washington departmental offices used examinations for clerk positions. Earlier, specialized exams had been developed for military medical personnel. While the use of exams was not extensive, it did provide experience that would be valuable later in the reform effort. These early features of a personnel system served as precedent for later decisions.

D. THE ROAD TO REFORM: 1865–1883

The Civil War demonstrated the effectiveness of spoils for a president with a divided country. Lincoln astutely used patronage to assure loyalty to the Union. Without spoils, it is not certain that the United States would have been kept together. In his effort to consolidate the support of the Republican party, Lincoln swept people from office in unprecedented numbers (Fish 1905). The party, in disarray, was only one of his concerns. He also had to find a way of holding the nation together. As a result, office holders from the South were purged and loyalists to the Union cause replaced them (Van Riper 1958; White 1958).

Lincoln's supporters expected him to again sweep people from office when he was reelected. He resisted the pressure and set a precedent that would be used by successors. His immediate successor, Andrew Johnson, faced severe political problems and was unable to withstand the same pressures, but Lincoln's steadfastness gave hope to reformers, who were beginning to be heard. Spoils had become marked for change and slow but steady progress was made in reform from 1865 to 1883.

Lincoln's administration consolidated a lot of power in the executive branch at the expense of Congress. When Andrew Johnson succeeded him in office, Congress saw the opportunity for reclaiming some of that power. Control over the personnel system became a major test of that attempt. Johnson was faced with opposition from within his own party and used his powers to remove many of those not loyal to him. Predictably, he angered many Republicans and lost much of his own party support.

To gain control over patronage, Congress passed the Tenure of Office Act of 1867, limiting presidential removal power. Johnson defied the act and Congress retaliated by impeaching him. By one vote, he avoided conviction and removal from office. The stage had been set for Congress to attempt to exercise its power, and for the next couple decades, Congress succeeded. Johnson and two weak successors, Grant and Hayes, could do little to stem the tide.

The Grant administration was tainted with serious corruption and scandal among many of its members. A similar situation also existed in most state and local governments. The result was a public image of government as hopelessly corrupt. The prestige of the public service was severely strained. To the surprise of many, President Grant actually supported personnel reform. Congress passed the Civil Service Reform Act of 1871 as a rider to an appropriation bill. Grant attempted to establish a merit system pursuant to the act and was successful for a couple years.

However, the scandals of his administration and political infighting led him to abandon the effort. Nonetheless, the Grant administration did provide a civil service experiment that actually laid out the basic principles on which much of the 1883 reform was built (Murphy 1942).

Part of the reason for Grant's abandonment of the reform effort was that it rekindled the conflict between Congress and the president over personnel. The 1871 act provided the president with authority over the public service that Congress was unwilling to accept. Thus, Grant's effort had to be abandoned in order for his administration to accomplish other objectives. The experiment did encourage reformers and their supporters to press their cause. Grant's successor, Rutherford B. Hayes, was unable to accomplish much, although he supported reform.

Public support for change contributed to the success of reformers (Hoogenboom 1964). Civic leaders and prominent politicians began efforts to bring about change. The New York Civil Service Reform Association (established in 1877) and the National Civil Service Reform League (established in 1881) were two of many organizations formed to rally public support for reform. The news media picked up on the concerns of the reformers and highlighted the abuses of the spoils system (Hoogenboom 1961, 1964; Nelson 1973). Garfield's assassination gave the press a dramatic event on which to base a lot of its call for reform, especially because his assassin was a disgruntled unsuccessful seeker of government appointment.

An 1876 Congressional act prohibiting assessment of government workers also fueled reform support. Assessments were contributions, or kickbacks employees were expected to make to their benefactors for getting a government job. Often, it took the form of a percentage of the employee's salary and may have been turned over to the political party. Under the patronage system, if employees refused to pay the assessment, they could be removed. Newton Curtis, an employee of the Treasury Department and Treasurer of the New York Republican party, was convicted of violation of the law. The United States Supreme Court decision upholding his conviction in *Ex parte Curtis* (1882) gave support to the reform movement.

As the Republicans saw their chances of retaining the White House in 1884 slipping, they considered methods of preventing the Democrats from making a clean sweep of government employees. Support of reform in the public service was viewed as the most viable approach, and the Pendleton Civil Service Act of 1883 was passed. The hopes of those who wanted to rescue the public service from the evils of spoils rested upon the implementation of the new law.

II. THE CIVIL SERVICE SYSTEM

Even with their victory in Congress, proponents of reform still had a lot of work to do. The Civil Service Act covered only a small part of the public service; approximately 90% remained subject to patronage (Hoogenboom 1958–1959, 1961). The act represented a partial victory by Congress in its struggle for control over the public service. While providing guidelines for the president, the act had to be worded very carefully so as to make sure that it did not violate the separation of powers provisions of the Constitution. To accommodate that issue, Congress authorized the president to establish a civil service commission to develop rules and regulations for personnel management and to implement those rules and regulations. The act avoided directing the president to do so (Ingraham 1995; Siciliano no date).

The act covered a variety of issues, including use of competitive exams, apportioning positions around the country, an open entry system, and presidential extension of coverage through blanketing-in of positions. There were also provisions to protect the political neutrality of the service, prohibition of assessments, and penalties for violating rules. The newly established Civil Service Commission moved slowly in establishing its authority and scope. Recognizing political reality, it did what it could to avoid major controversy in its early existence. As a result, it gradually acquired prestige and influence, so that it became the major actor in public personnel management in the United States for ninety-five years before it was dissolved and other organizations were

created in its place in the 1978 reforms (Rosenbloom 1982; US Civil Service Commission 1974, 1978; US Office of Personnel Management 2002).

A. IMPLEMENTING REFORM

The early years of the civil service system were difficult because opponents continued to attempt to weaken or destroy it. Leonard White (1958) reports that efforts to undermine the civil service included evasion of rules by public officials, giving it limited resources, reducing its powers, and renewing proposals for a four-year term for all public servants. Many members of Congress introduced bills to repeal the Pendleton Act during the first decade and a half of its existence.

Despite the conflicts it had to endure, the civil service system gained status gradually and by the turn of the century was well established. Each president encouraged the supporters of the system through extension of coverage to larger numbers of employees. President Cleveland went furthest, as he issued executive orders at the end of each of his terms that brought large numbers of employees under the jurisdiction of the Civil Service Commission.

His inclusion of 30,000 positions under civil service in the last year of his administration resulted in many complaints from the incoming Republicans. This episode actually brought to the forefront a discussion about the relationship of the political and career public service. Debate centered on the distinction between the two. Woodrow Wilson (1885), soon to become a major figure in that intellectual stream of thought, wrote about the difficulties in distinguishing between the political and nonpolitical in government service. Of course, later, Wilson (1887) was to make a strong defense for the separation of the two. The Civil Service Commission took the position that the vast majority of positions in the public service were nonpolitical, and that view has been reflected in most of the history of the civil service.

The appointment of Theodore Roosevelt as a member of the Civil Service Commission in 1889 was probably one of the most important factors in the Commission's early ability to withstand the pressures surrounding it (White 2003). Roosevelt became a very outspoken and articulate spokesperson for the civil service and broadened its popular appeal. When Roosevelt assumed office as President in 1901, the debate over whether the civil service would continue to exist ended.

At the same time the Commission was struggling for its survival, it also developed a basic set of guidelines separating politics and administration. The Commission drew up rules and guidelines for public servants that generally prohibited partisan political participation by government employees. These guidelines eventually became the rules that govern employees today. The policy included prohibition of assessment of public employees.

Examinations constituted a large part of the work of the Civil Service Commission in its early days, but it made progress in other areas, as well. The Commission took steps made in setting up a classification and pay system for many national government employees. Basically, the Commission assumed the role of ensuring implementation of the Pendleton Act of 1883. In assuming that role, it established the policing or monitoring function of personnel agencies that has been the subject of much disagreement over the years (Sayre 1948). Operating departments often resent the role, while employees and unions often view that role as one that protects their interests. Policy makers also like to see the personnel agency enforcing the policies they develop.

At the same time the civil service system was becoming institutionalized, there were many changes in society that presaged future developments. Among the most important for public personnel management was the development of unions among public employees (Brooks 1971; Coleman 1990; Kearney 2001; Moskow et al. 1970; Rabin et al. 1994; Stieber 1973). While reference to public employees meeting and pressing their grievances has already been made, the organization of unions involved a more important symbol of public employee concerns. The National Association of Letter Carriers was organized in 1889, and others followed. These developments led to pressure on the political system to consider the needs of employees. Subsequently, benefits packages and other perquisites for employees became part of the public personnel system.

While these developments were taking place in the national civil service system, state and local governments experienced pressures for the same types of changes (Aronson 1974; Dilts et al. 1992; Pynes and Lafferty 1993; Rabin et al. 1994). As noted above, some civic groups and leaders emerged at the local level, and they resulted in the national model being adopted for state and local governments as well, although reform came very slowly.

B. CONSOLIDATION OF REFORM PRINCIPLES

During the first four decades of the twentieth century, the civil service system successfully institutionalized a politically neutral public service (US Civil Service Commission, 1974; Van Riper, 1958). The succession of Theodore Roosevelt to the presidency after McKinley's assassination provided a much-needed stimulus to the efforts. McKinley had acceded to political party pressure and utilized much patronage in his personnel decisions. Much to the dismay of civil service partisans, he removed approximately 6000 positions from the coverage of the merit system. His action was in response to Cleveland's blanketing-in of nearly 30,000 positions. Nonetheless, it troubled those who had worked to develop a nonspoils approach to staffing the public service.

President Roosevelt was a friend of the civil service. Having been a very active Civil Service Commissioner, Roosevelt was outspoken in his efforts to put the public service on a sound merit basis (Kaufman 1965; White 2003). Roosevelt also reflected the moralistic fervor of the nineteenth century reformers in believing that the public service should be based on honor and integrity. Making it politically neutral was an important part of giving it a positive and moral image (Van Riper 1958; White 2003). His sincere effort to rid the government of corruption is reflected in his administration's investigation of scandals in various parts of the civil service.

In addition to his commitment to the ideals of the civil service, Roosevelt's close working relationship with the Civil Service Commission helped institutionalize the system. Because of his previous membership on the Commission and interest in its work, he was very knowledgeable about the civil service. Additionally, he appointed close friends to the Commission and developed a very close working relationship between the system and the rest of his administration.

Roosevelt was uncompromising in his dealings with opponents, and that approach led to conflicts with members within his own party as well as with Congress. For example, Roosevelt forbade federal employees from communicating directly with Congress regarding working conditions and pay. While he was successful in prohibiting such direct contact, it also inspired Congress to react. During Taft's administration, Congress passed the Lloyd-LaFollette Act of 1912, which guaranteed the right of federal employees to petition Congress and also guaranteed them the right to organize. This was the first statutory recognition of the right to organize, and was important in the development of public sector unions. Congress did impose a condition: that the union and employees could not advocate the use of strikes.

Roosevelt also was instrumental in establishing the open shop as a part of public employment. In a case involving reinstatement of an individual who had been fired because he was expelled from a union of which he had been a member, Roosevelt stated that the rules of a union could not supersede the law of the nation (US Civil Service Commission 1903). While the person could be a member of the union, the union could not require membership as a condition for employment. That doctrine has persisted in public employment through right-to-work laws.

During Roosevelt's administration, departments and agencies constantly violated the rules prohibiting political participation by public employees. Because of the difficulty in enforcing those rules, Roosevelt issued orders that separated parts of the service for that purpose. He distinguished between the classified and nonclassified service, and thus the distinction between political and career servants emerged. Again, the innovation resulted from the president's commitment to a neutral service and recognition of practical limitations. He insisted upon enforcement of the partisan political participation ban on classified servants but recognized the need for some freedom in appointing loyal supporters in policy positions.

As the twentieth century began, journalists exposed corruption in American institutions, both public and private. Roosevelt termed these journalistic advocates of reform “Muckrakers” (Weinberg and Weinberg 2001). The Muckrakers put state and local government, in particular, under the spotlight. Led by Lincoln Steffens (1904), these proponents of reform exposed corruption and spoils in major cities and in state government. The results of their publicity and reform efforts were policies adopted at the state and municipal levels to place personnel management on a more nonpartisan, merit basis (Aronson 1974). Civil service systems were adopted in states such as Wisconsin and Illinois in 1905, as well as Colorado (1907) and New Jersey (1908). In the next decade, several more states followed suit.

Between 1900 and 1910, cities such as San Francisco, Los Angeles, Philadelphia, Tacoma, Des Moines, Cleveland, and Newark also adopted civil service systems. Some cities developed civil service systems only for their police and fire departments, and vestiges of that approach still exist in many places, as police and fire departments are treated separately from the rest of the personnel system. Most cities in Texas, for example, have separate personnel systems for public safety services. While state and local governments had led the way in development of spoils, they experimented with civil service after the national civil service system was relatively well developed.

From 1910 to 1920, there were not many major changes from the pattern established by the Roosevelt administration at the national level. At the state and local levels, the number of jurisdictions adopting some form of civil service gradually increased. While there were not a lot of major developments, there were some very significant ones that would have an impact on public personnel management for a long time to come.

Wages and salary were always issues of concern to public policy makers. The civil service system attempted to provide some rational basis for establishing pay. In the national government, distinctions between levels of clerks, for example, were used for differentiating pay. As public employment became more and more professional, it became necessary to develop a formal system for distinguishing jobs. Chicago created the classification system in 1912, leading the way in formal job analysis and classification (Civil Service Assembly 1941). It was not until eleven years later that the national government adopted such a system, but state and local governments experimented with it during the intervening years. Position classification became a major tool in the institutionalization of a formal management system in personnel and is one of the most persevering elements of the early civil service system.

The veterans’ preference system is another legacy of this period that has proved extremely durable. The Veterans’ Preference Act of 1919 provided preference to all honorably discharged veterans in the federal classified service. While the public service had few veterans prior to the adoption of this act, their number increased to 13.6% in 1920–1921 and to 28.9% the following year. It peaked once, at 34.1% in 1922–1923, and again after World War II, when it reached 50%, a level that was maintained until the 1980s (Emmert and Gregory 1982). In 2005, the percentage of veterans in federal employment was 25%, approximately where it has been since the early 1990s (US Office of Personnel Management 2005). The important legacy for public personnel management was that this policy has persisted with very few modifications (Davis 1982). In 1923, President Harding made one major modification by establishing the five- and ten-point preference system to distinguish between disabled and nondisabled veterans, respectively. That distinction remains today, and actually was strengthened in the 1978 Civil Service Reform Act, which allowed appointment of disabled veterans without competitive exams and gave them retention rights in reductions-in-force.

Collective bargaining also has important roots during this period (Dickerson and Cayer 1994; Kearney 2001; Nesbitt 1976; Spero 1927; Stieber 1973). At the national level, the Federal Employees Union was organized in 1916 among clerks in the War Department. In 1917, the American Federation of Labor (AFL) granted various local organizations a charter as the National Federation of Federal Employees, which still exists. Finally, events in 1918 and, especially, 1919

set precedents for public sector collective bargaining—or labor–management relations, as many public officials prefer to call it (Ziskind 1971). Police strikes occurred in cities such as Cincinnati (1918) and Boston (1919). The Boston strike was especially bitter, and the Governor of Massachusetts, Calvin Coolidge, took command of the situation by dismissing all the striking officers. He asserted that no one had the right to strike against the public safety and became a hero and Republican candidate for president. The next year, Congress passed legislation prohibiting the Washington, DC police and fire officers from striking. The doctrine that public employees have no right to strike emerged from the actions in these two instances. The tarnished image of public employees and unions that accompanied the situations created a resistance to public employee collective bargaining that held until the 1960s.

President Taft appointed the Commission on Economy and Efficiency in 1910 to analyze the public service and make recommendations for its improvement. This Commission reflected a business approach to management and attempted to evaluate all aspects of the civil service for purposes of determining the most effective way of conducting its work. The Commission's recommendations were consistent with the scientific management approach that was beginning to influence public personnel management. Many of the recommendations were adopted in later decades, but the Commission's recommendations had very little immediate impact. It did establish an agenda that has been important for much of the twentieth century, though. That agenda includes centralizing the personnel function and making it a tool of the chief executive. The analysis of pay rates and other problems in working conditions focused attention on those issues in a systematic manner and eventually contributed to efforts to make the system more rational, consistent, and equitable.

The second decade of the twentieth century came to an end with Woodrow Wilson as president. His views on politics and administration were well known from his nineteenth century writings. He had been active in the National Civil Service Reform League and supported merit during his tenure as New Jersey's governor. However, he faced strong pressure from his political party because it had been out of power for a long time and wanted the spoils that went with its victory. Wilson attempted to resist the demands of his party, but he was not very successful. Nonetheless, he maintained his strong support of the merit system and mitigated the worst effects of patronage through his strong-willed support of his ideals. Out of necessity, he had to make accommodations to partisan politics.

The United States' entry into World War I in 1917 had a profound effect on the public service. The need for employees expanded quickly and the Civil Service Commission found it necessary to recruit outside the merit system. Many exceptions to merit procedures were made to staff new and growing agencies. While many merit proponents were critical of these changes, they did not have much of an impact, as the attention of the nation was focused on the war effort. In a particularly important action during the war, Wilson issued an executive order providing for the removal of federal government employees who were considered disloyal to the nation. While the executive order did not have much immediate effect, it became an important precedent for the post-World War II era.

The 1920s witnessed continual but gradual entrenchment of the civil service system. The Harding administration, known not for its strong efforts in personnel management, but rather for being scandal-ridden, got Congress to pass the Budget and Accounting Act of 1921, which affected personnel significantly. Creation of the Bureau of the Budget and other features of the act placed a focus on improving management coordination of government activities. A major element of that management was personnel, and the effect was to centralize the personnel function more. The Budget and Accounting Act of 1921 is the major achievement of the Harding administration.

In 1920, the Retirement Act was passed, establishing a precedent for public employee retirement pensions. Congress passed the law but provided no public funding for it. Rather, employee contributions funded the system.

When Calvin Coolidge succeeded Harding, he inherited the breaking scandals. He toned down the patronage process to a great extent, but did use it effectively in consolidating his own control

over the party. Committed to the merit system, Coolidge sought to bring business practices and perspectives to the public service. During his administration, the Classification Act of 1923 was passed, establishing the concept of classification in the federal service. It had limited impact in that it was restricted to public servants in the Washington, DC area, but it did set salary ranges and made provisions for determining raises for employees. Like many other actions during the early twentieth century, this act was probably more important in the long run than at the time it was passed. It provided the model for future expansion of the classification system that would become a critical element of traditional civil service systems.

Overall, the 1920s were good years for the civil service system. While there were not many dramatic developments, neither were there major setbacks. The Civil Service Commission received increasingly more support over the decade and continued to establish itself as a leading management organization in the federal government. It worked with departments to develop more management-oriented approaches. Some departments, such as Agriculture, began to develop their own personnel offices for day-to-day personnel functions. The Commission continued to focus on examinations as a major activity and worked on improvements in exam procedures.

As Newland (1976) suggests, the bureaucratic model of personnel was complete in the federal service by the 1930s. In fact, during the 1930s, many of the more bureaucratic elements of the personnel system were targets of criticism. Some changes resulted from those criticisms, but it was not until the 1970s that many of the major recommendations of critics were taken to heart (Morse 1976; Rosenbloom 1982). The bureaucratic elements were advocated as a way of separating politics and administration (Barnard 1968; Goodnow 1900; White 1926). To the extent that personnel during this period focused on management, it emphasized techniques and finding the best way of doing things as outlined by the Scientific Management School. During the late 1930s, the concept of management was to undergo a change as applied to the public service.

C. THE 1930S: THE RISE OF ADMINISTRATORS

The 1930s represent two very different traditions in public personnel management, yet the two traditions also worked together. Mosher (1982) refers to the years before 1937 as part of the era of government by the efficient and the post-1937 years as government by administrators. The beginning of the 1930s, with Hoover as president, continued the pattern of the Coolidge years, when business efficiency was of paramount importance to the administration. The depression, of course, added some new concerns, but had little effect on personnel practices as such. The election of President Franklin Roosevelt, however, was to have major implications.

Roosevelt's first term was discouraging to the proponents of merit systems (Harvey 1970; Kaufman 1965). The administration elevated the use of patronage to a new high. After decades of Republican government, the new Democratic president felt that his hands were tied in reorienting government to new values. The fact that a major emergency existed in the form of the Depression made it possible for Roosevelt to get his way. One of the most effective ways of reintroducing patronage was to get Congress to create new agencies outside the protected service. The so-called alphabet agencies of the Roosevelt administration were created in just this way. By 1934, some sixty agencies had been created outside the coverage of the civil service, while only five were placed under jurisdiction of the Civil Service Commission (Van Riper 1958). Congress willingly went along because it was now controlled by Democrats, who were hungry for spoils. The president espoused the principles of merit during this time but acted to gain control over programs and agencies.

One new departure during this time was the creation of the Tennessee Valley Authority (TVA) with a personnel system of its own (Selznick 1949). Its system was based on merit. A few other agencies eventually developed along the same line.

While patronage was ascendant, the Civil Service Commission was losing support. Its budget had been cut during the Depression and it had little power to stem the tide of the new

administration's efforts. It contented itself with refining the examination function for those agencies under its jurisdiction.

Roosevelt's second term represented a major shift in the outlook on the public service (Harvey 1970). By then the patronage system had accomplished its purpose and public sentiment began to reflect some of the concerns of critics of the administration's use of patronage. Roosevelt was now able to act on the ideals he espoused concerning merit. He appointed the President's Committee on Administrative Management in 1937, popularly known as the Brownlow Committee. The committee was charged with examining government with an eye to reorganization and improved management. The Brownlow Committee made many recommendations that related directly to the public service (President's Committee on Administrative Management 1937). The report had the effect of elevating personnel management to a high level of consideration in the administration and in Congress, although immediate action on recommendations was not forthcoming. The Committee recommended that the Civil Service Commission be reorganized so that there be a single personnel director whose operations would be closely integrated with the rest of the administration. Furthermore, it was critical of the centralization of many personnel activities by the civil service, and the president directed departments to develop personnel units to handle day-to-day responsibilities.

Many of the other recommendations found their way into specific legislation. The Ramspeck-O'Mahoney Postmaster Act (1938), for example, went a long way toward bringing merit to postal appointments. The postal service had been the epitome of spoils. The Hatch Acts of 1939 and 1940 also incorporated some of the Committee's recommendations into statute (Kaplan 1940; Kirchheimer 1941). The 1939 act codified prohibited political activities for federal employees, while the 1940 act extended the prohibitions to state and local government employees working in programs funded by federal monies. The 1940 act also forbade employment of individuals advocating overthrow of the government through violent means. Members of Congress became suspicious of the president's intentions in the upcoming elections. Fearing that Roosevelt would have a vast army of partisan public employees to use in the reelection effort in 1940, the Congress found good reason to institutionalize partisan political participation prohibitions (Nelson 1958; Rose 1962).

In 1938, Roosevelt blanketed-in many employees in the alphabet agencies, partly in response to the Brownlow Committee suggestions. Congress passed the Ramspeck Act of 1940 to control blanketing-in. While the act actually encouraged blanketing-in of employees, it required noncompetitive examinations for those being blanketed in, thus reinforcing the concept of merit or competence as necessary for public employment (Harvey 1970). Additionally, the Ramspeck Act of 1940 encouraged the Civil Service Commission to analyze the civil service through pay and classification studies. It also prohibited discrimination in employment on the basis of race, religion, or color.

The Social Security Act of 1939 also directly affected public personnel management by establishing standards for state and local government merit systems (Aronson 1940). These standards applied to agencies and programs funded by federal government monies. Employees in those programs covered had to be governed by a merit system, and these standards established minimum requirements for such systems.

Congress passed many significant labor laws during the 1930s and 1940s, as well (Brooks 1971; Cayer 2003; Dickerson and Cayer 1994; Kearney 2001). Establishing a trend that survived until the 1960s, the National Labor Relations Act of 1935 specifically excluded most public employees from its coverage. Thus, while the rights of private sector employees were protected, public employees were not accorded the same type of coverage. Nonetheless, other developments did work to the benefit of public employees. The American Federation of State, County, and Municipal Employees (AFSCME) was founded in 1935 and had a major impact on state and local governments (Kramer 1962). It was an outspoken supporter of the merit system in state and local governments, believing that it protected employees from the ravages of spoils manipulation. Beginning in 1939, the City of Philadelphia negotiated agreements with its employees.

Thus, while national legislation was not supportive of public employee collective bargaining, unions were making their marks elsewhere.

III. BIG GOVERNMENT

With the programs of the 1930s to deal with the depression and social problems, the nation moved from a limited government perspective to one in which government was viewed as having responsibility for solving a wide range of social and economic problems. The passage of the Social Security Act amendments of 1939 was especially symbolic because it became the foundation of much social legislation for the next thirty years.

A. MEETING WARTIME AND PEACETIME PERSONNEL NEEDS: THE 1940s

The first half of the 1940s continued the policies of President Roosevelt, although there were some specific new developments. In essence, the idea of personnel management being a positive management force and providing assistance to operating departments rather than only negative policing forces took hold. Characterizing the development of much of personnel up to this time, Sayre (1948) referred to it as a triumph of technique over purpose. Rules and procedures were streamlined during this period and greater flexibility in recruitment developed. In particular, a junior management exam was created to recruit college-educated generalists into the public service.

Between 1939 and 1941, recruitment skyrocketed. The workforce doubled from approximately 900,000 to 1.8 million employees. This massive recruitment led to greater flexibility in the process and much decentralization of responsibility to operating departments. The Civil Service Commission acted increasingly as a coordinator of activities and this activity enhanced its status and authority. To avoid some of the problems faced after the Civil War and First World War, these recruitments were considered temporary, to last during the war and for six months afterwards. The jobs of those who went to war were protected by this provision. The Veterans' Preference Act of 1944 provided more protection by putting into statute many of the practices that had been stimulated by the 1919 Veterans' Preference Act. State and local governments followed suit.

Not surprisingly, loyalty and security became issues during the war as well, although the post-World War II era brought much greater attention to those issues (Bar of the City of New York, 1956; Latham 1966; Morganthau 1955). The House Un-American Activities Committee (HUAC) created in 1939, conducted some investigations during the early 1940s. The administration also paid attention to the issue in the form of executive orders and directives.

When Harry Truman assumed the presidency, there were many conflicts to be addressed. Of course, the difficulties of demobilization and dealing with the post-World War II balance of power occupied much of his time. These concerns affected his ability to attend to domestic affairs. The death of Roosevelt also left a void in political leadership that Truman had to try to fill. The public and Congress were not eager to make his job easy. While Truman was a strong supporter of the merit system, he also had to deal with internal political conflicts in the Democratic party; pressures for patronage were strong. Nonetheless, on that score, the Truman administration did not significantly change the Roosevelt policies. The administration was fraught with minor scandals that fueled the fires of Congressional wrangling with the president. The public service was often the scapegoat for much of the conflict.

The new administration faced the immediate challenge of absorbing the military personnel into the domestic work force. To do that, and to reinstate those whose jobs had been protected as they went to war, required development of rules and regulations. Reduction-in-force policies were developed to separate those employed on a temporary basis from the service. Processing the paperwork to reemploy those whose jobs had been protected was a massive endeavor, but because of careful planning by the administration and the Civil Service Commission, the effort went smoothly. A major feature of its postwar effort involved reinstatement of competitive

recruitment and selection procedures to replace the more flexible policies that were used during the war build-up.

While providing for the adjustment to peacetime, the Civil Service Commission benefited from good appointments by both Roosevelt and Truman. Taking their responsibilities seriously, the commissioners developed a blueprint for managing the public service in peacetime. Their plans emphasized the expansion of the merit concept and improved techniques throughout the organization of the public service (Harvey 1970). The Commission also worked toward cooperation with operating agencies, with the Commission having responsibilities for setting standards and the operating departments assuming responsibility for implementing the standards (McDiarmid 1946). The Civil Service Commission also assumed monitoring responsibilities to insure proper implementation of its guidelines. Thus, the work of the Commission became more service-oriented than action-oriented as it related to specific departmental personnel.

Truman directed the Civil Service Commission to extend its classification policies to the entire civil service in 1945. The Commission dealt with a great deal of conflict in attempting to get field offices around the country to comply with the system. The Classification Act of 1949 resulted in part from that conflict. The act consolidated the Commission's authority and strengthened its role, especially in terms of auditing classifications.

Partially in response to the conflicts between the executive and congressional branches over control of the government and its employees, Congress created the First Hoover Commission in 1947. The recommendations of this Commission reflected many of the same concerns as those of the Brownlow Committee of 1937. In particular, the Commission strongly recommended greater decentralization of personnel functions and called for reorganization of pay and classification policies (Hoover Commission 1949). The Commission's report, like reports of such bodies before, helped set the agenda for public personnel policy decisions for a long time in the future. The immediate impact, however, was piecemeal and limited. It did stimulate a great deal of discussion of the role of personnel management in the federal government, thereby focusing attention on the service.

The Truman administration also took tentative steps toward development of employee relations programs. Many agencies addressed the health and welfare of employees. The Commission evaluated national government contributions to retirement systems and recommended changes, although it was not until later that much would be accomplished in this regard. Powers and functions of the Board of Appeals and Review of the Civil Service expanded in an effort to protect employee rights. The board had been created in 1930 but had very limited authority.

Among the more controversial elements of the immediate postwar personnel issues were loyalty and security. Because both the executive branch and Congress dabbled in loyalty and security issues, they became political hot potatoes (Latham 1966). The Truman administration was able to contain the issue for the most part, but in the 1950s, politics took over and the system ran amok. Truman created a loyalty program by executive order in 1947. The order gave the Civil Service Commission responsibility for the program. Loyalty investigations were developed and loyalty boards created to review cases. Generally, these programs cooled down the atmosphere, but Congress stirred things up occasionally (Bar of the City of New York, 1956). The Senate Investigation Subcommittee began investigations after 1948, and by 1954 was making vitriolic attacks on the public service.

President Truman's actions regarding equality of treatment and opportunity in the federal service represent some of his most significant and controversial contributions to public personnel management (Axelrod 2004; Gardner 2003). In 1946, he created the President's Committee on Civil Rights to study and make recommendations to him regarding racial discrimination in federal employment. Based on the Committee's recommendations, he sent a message to Congress in February 1948, requesting it to adopt legislation to end all racial discrimination, including discrimination in employment. Predictably, Congress did not act on his request, and he issued Executive Order 9980 on July 26, 1948, requiring each cabinet officer to integrate his/her workforce.

The order also detailed an implementation process and created the Fair Employment Board within the Civil Service Commission to review employment discrimination. It permitted employees or applicants to appeal decisions by employment officers directly to cabinet officials. On the same day, Truman issued Executive Order 9981, which required the military to provide equal treatment and opportunity to all personnel, thus integrating the Armed Forces. These actions by President Truman were not popular with Congress, military officers, or much of the electorate. Nonetheless, his policies prevailed and began the slow process of desegregation and anti-discrimination efforts in the federal and military services. These actions also started the push for broader social justice that took hold in the 1960s.

The United States' entry into the Korean War stimulated another buildup in the public service. The World War II experience served the nation well, and the buildup went relatively smoothly. The controversy over participation in the Korean War, however, had effects for all of the administration's domestic affairs. The public service tended to lose stature and got caught in the middle of the political conflicts. There were few specific personnel actions or policies that emerged from the conflict, but the Civil Service Commission once again had to use its expertise in recruiting large numbers of personnel. The flexibility developed during World War II returned to the recruitment and selection processes, as appointments once again were made temporary for the duration of the emergency.

B. SLOWING GOVERNMENT GROWTH: THE 1950s

The Eisenhower administration brought a business orientation back to government and the public service. It also represented the Republicans' opportunity to recapture some patronage after twenty years out of office. The administration was committed to economy and efficiency in government, and that translated into pressure on the public service. While Eisenhower was not particularly strongly patronage-oriented, he did experience pressures to reward the party, and in higher-level positions, patronage was evident. Otherwise, though, he was committed to the merit system. The biggest problem faced by the administration was that in bringing many people from the business world into public service, there was often insensitivity to expectations concerning public officials' conduct. Practices common in business were often frowned upon in the public service. As a result, the administration was plagued by conflicts of interest and other minor scandals that affected the public image of government in general. The civil service suffered in status and the morale of the public service was low (Kilpatrick et al. 1964).

The relationship of the Civil Service Commission to the administration changed during the Eisenhower administration (Harvey, 1970). The president made the chair of the Commission his assistant for personnel administration, thus giving the appearance that the Commission was more involved in political patronage issues as well as civil service concerns. That relationship further clouded the image of the public service.

The president also proposed the development of Schedule C to provide opportunities for utilizing high-level officials in a variety of positions. They would serve at the pleasure of the administration and would not have civil service protection. Schedule C was the predecessor to the Senior Executive Service, established at the end of the 1970s. While the administration experimented with the concept, it never was actually implemented.

The loyalty and security issues erupted into a major conflict during the Eisenhower years. An executive order in 1953 allowed departments to administer loyalty and security programs. The order also included a more vague standard for loyalty and security. Departments could separate employees for inconsistency with national security interests. That criterion was subject to much discretion and abuse (Rosenbloom 1971). At the same time, Senator Joseph McCarthy of Wisconsin began targeting individuals in department agencies, especially the State Department, for attack (Morganthau 1955). As Chair of the Senate Committee on Government Operations and its Permanent Subcommittee on Investigations, McCarthy launched vitriolic attacks on the public service,

using anti-Communism as his justification. Many people had their careers ruined because the Senator accused them of having Communist sympathies. The administration did little to defend public servants. Predictably, morale sank to new lows. In 1954, the celebrated Army hearings during the summer were conducted in a circus atmosphere and McCarthy finally went too far for his Senate colleagues, who voted to censure him in December. Things calmed down somewhat, but the HUAC continued investigations into the 1960s. The vitriol of these activities did nothing to improve the status of the public service.

In 1955, the second Hoover Commission published its recommendations after examining the organization of the executive branch. Once again, its recommendations paralleled those of earlier committees and commissions. The distinguishing features of its recommendations were a call for more distinction between policy and administration as far as personnel was concerned and the call for creation of a Senior Civil Service along the lines of Eisenhower's Schedule C. The Commission also criticized the red tape in the personnel process and called for more flexibility and accountability (Commission on the Organization of the Executive Branch of Government 1955). Eisenhower proposed the creation of a Career Executive Program in 1957 and actually went so far as to create it by executive order, but political opposition in Congress ultimately thwarted the effort.

Collective bargaining continued to spread during the 1950s, especially at the state and local levels (Brooks 1971; Coleman 1990; Dickerson and Cayer 1994; Dilts et al. 1992; Kearney 2001; Stieber 1973; Wellington and Winter 1971). The Eisenhower administration was unsympathetic to collective bargaining; therefore, there were few developments at the national level. New York City began bargaining with its employees pursuant to an executive order issued by Mayor Robert Wagner in 1958. Wisconsin became the first state to provide for collective bargaining for public employees with the passage of legislation in 1959. These developments set the stage for a surge in such activity in the 1960s (Grodin and Wollett 1974; Hanslowe 1967; Moskow et al. 1970).

Concerns with employee welfare were not high on the agenda during the 1950s, but the government began to develop policies to better utilize human resources. The Government Employees Training Act of 1958 signaled recognition that it was necessary to deal with employee development. While the act focused on specific skills training, it represented an important step in working with employees. Many state and local governments followed suit.

C. ACCOUNTABILITY, EQUITY AND JUSTICE: THE 1960s

The early 1960s represented a period of idealism, epitomized by the Kennedy administration's mystique. A new image of the public service as being able to do anything it set its mind to encouraged many young people to pursue public service careers. Recruitment on college campuses was stepped up and the Peace Corps brought many people into that special segment of the public service.

The idealism of the 1960s was infused with a sense of social justice and fairness. The civil rights issue began to develop as a national agenda in the early 1960s and by the middle of the decade had become the major item on the agenda (Dye 1971; Galbraith 1973; Gardner 1961). Similarly, the plight of the poor and downtrodden received a great deal of attention. The Kennedy administration provided the philosophical thrust to these issues, along with many groups in the society. It was not until after John F. Kennedy's assassination, though, that many programs to address these issues were actually implemented.

With attention turning to social justice, the hold loyalty and security issues upon the national attention weakened. As a result, the public service was less a target of Congressional investigation. The role of the Civil Service Commission changed somewhat during the Kennedy years, as well (Harvey 1970). The chair of the Commission was actually made manager of the work of the Civil Service Commission. The Commission as a whole became the policy makers. The thrust was

to make the Commission more cognizant of the integration of its policy with management, and the chair became more powerful than in earlier administrations.

Probably the biggest legacy of the Kennedy administration was in collective bargaining. Executive Order 10988 (1962) recognized, for the first time, the right of federal government employees to engage in negotiations with their employers. Agencies were directed to develop procedures for bargaining. This executive order set the tone for much of the country. As has been noted earlier, some state and local governments had already developed similar policies, but after 1962, the collective bargaining movement gained legitimacy and momentum. During the rest of the 1960s and into the 1970s, public sector collective bargaining grew phenomenally (Kearney 2001; Warner 1963; Wellington and Winter 1971). The Kennedy order was revised by later orders and finally by the Civil Service Reform Act of 1978, but its basic assumptions continue to serve as the foundation for federal service and much of state and local labor management relations (Horton 1973; Piskulich 1992; Sulzner 1982).

The Federal Salary Reform Act of 1962 and the Equal Pay Act of 1963 reflect the interest in equity and justice that affected the personnel system. The 1962 act made comparability with the private sector a feature of the compensation system, and the equal pay legislation required equal pay for equal work, thus focusing on internal equity. The Pay Comparability Act of 1970 refined the comparability issue and actually specified a process for determining comparability. This process was refined further by the Federal Employees Pay Comparability Act of 1990. The Bureau of Labor Statistics now conducts a national survey of professional, technical, and clerical pay for purposes of comparing national compensation with the private sector. This annual review is used to determine federal service pay levels.

The assassination of President Kennedy and succession of President Johnson presaged a period of intense conflict. The new president utilized his legislative skills to get Congress to pass a lot of social legislation. Among the most significant was the Civil Rights Act of 1964 (Gutman 2000). Although the employment part of the act applied only to the private sector, it set a tone for employment practices generally (Dye 1971). Governments at all levels were under pressure to conduct personnel processes in a nondiscriminatory manner. The act eventually was extended to the public service by the Equal Employment Opportunity Act of 1972 (actually an amendment to the 1964 act). Equal employment opportunity and affirmative action were to dominate the 1970s agendas and had their impetus in the 1960s (Glazer 1975; Gutman 2000; Hudson and Broadnax 1982; Kranz 1976; Krislov and Rosenbloom 1984; Rosenbloom 1977). Arising from similar values, the Age Discrimination in Employment Act of 1967 set limits on age discrimination.

The legislation and other policies focusing on equity issues stimulated a great deal of litigation during the late 1960s. The tendency to litigate issues continues to this day. Plaintiffs litigated not only issues of equal opportunity, but all types of employee rights issues (Baird et al. 1995; Jaegal and Cayer 1991; O'Neill 1993; Roberts 1985; Rosenbloom 1970, 1971, 1981; Rosenbloom and Carroll 1995). Litigation concerning the Hatch Act and its state counterparts was also frequent during this time (Martin 1973). Similarly, there were many challenges (generally unsuccessful) to veterans' preference policies at the national and state levels.

The dynamism and idealism of the 1960s had conflicting impacts on the public service. The early years of the Kennedy administration had an aura of optimism about them that gave the public service a good image, especially among young people. The morale problems of the public service during the 1950s faded. With the social upheaval of the middle of the decade, there were many conflicts with established values that strained the public service. Many critics of the conservatism of bureaucracy aimed their attacks at the public service. At the same time, there was a sense that government could accomplish anything it set out to do. The results were reflected in a developing distrust of the establishment (including the public bureaucracy) and a yearning for change.

The New Public Administration was born in the 1960s and found expression in the Minnowbrook conference in 1970 (Marini 1971). The New Public Administration focused on the need for public administrators to be change agents and was infused with a great deal of idealism about

the mission and integrity of the public service (Bellone 1980; Frederickson 1980; Waldo 1971). Advocates of the New Public Administration suspected the existing bureaucracy of serving the interests of the economically and politically powerful. Some students of bureaucracy also characterized the system as a new machine politics, serving the interests of the professional bureaucrat rather than the citizen (Lowi 1967). Consistent with emphases on social justice and equity, the New Public Administrationists were supposed to become the advocates for the clientele of agencies and programs and particularly for the powerless and downtrodden. While it is not surprising that public bureaucracy did not openly embrace the New Public Administration perspective, it is also clear that the movement has sensitized the bureaucracy, policy makers, and the general public to the issues it raised.

IV. RETRENCHMENT AND REFORM

Since 1970, political values have moved away from the idea that government intervention is the answer to all societal problems and toward a calculated evaluation of what government should be doing. The result has been a focus on economizing in government and in reducing its size (Levine 1978, 1979; Nathan et al. 1983; Rubin 1985). Evaluation of programs and activities is also a major objective in much of government policy since the early 1970s.

A. SETTING THE STAGE FOR REFORM: THE 1970S

The early 1970s were troubled times for the nation as a whole and the public service in particular. With the election of President Richard Nixon in 1968, political party control of the presidency once again changed hands. Unfortunately for the Nixon administration, control of the Congress did not change. Thus, a struggle was inevitable, especially because there was also much personal distrust and animosity between the leadership of the administration and leaders in Congress.

The Nixon administration clearly wanted to cut back on government activity and deemphasize social issues, but these objectives were virtually impossible to accomplish, given Congressional opposition. Consequently, many of the social equity issues of the 1960s carried over and were reflected in such acts as the Equal Employment Opportunity Act of 1972, the Comprehensive Employment Training Act of 1973, and the Rehabilitation Act of 1973. These laws promoted employment opportunity for groups that had earlier been the target of discriminatory practices. For the most part, the administration did not actively support these programs.

Social equity issues continued to be addressed in the courts and by the Equal Employment Opportunity Commission, among other agencies. Actually, many conflicts developed. Much of the litigation centered around examination issues, although court action also addressed pay issues (Kearney and Hays, 1985). Reflecting concerns with equity, the Equal Employment Opportunity Commission (EEOC) published guidelines for state and local governments and contractors to use in selecting employees in 1970. The Departments of Justice and Labor and the Civil Service Commission promulgated separate guidelines in 1976. After much confusion about the two sets of guidelines, the two were compromised and a single set was developed in 1978. These guidelines had a great impact on state and local governments. Many grants were awarded on the condition that the grantee have an affirmative action plan. Similarly, individuals who felt they had been discriminated against were able to bring charges against employers to contract compliance offices or the EEOC. Employers found to be discriminatory could be subject to a variety of remedies, including back pay and employment of the individual discriminated against. Usually, the guilty party would also be required to develop and implement an affirmative action plan.

Examinations came under a great deal of scrutiny in this period as well. The Federal Service Entrance Examination (FSEE) was criticized for not being job-specific enough, and thus subject to equal employment suspicion. The Professional and Administrative Careers Exam (PACE) was developed in 1974 to replace FSEE. PACE was criticized on the same grounds and was

discontinued in 1984. Each department is now responsible for developing its own exams relevant to the jobs for which it is recruiting. Assessment centers for the selection of employees or for promotion became popular during the 1970s (Ross 1979; Sackett 1982). They replaced traditional exams in many decisions.

Nixon advocated general revenue sharing as a way of loosening the federal government's control over activities at the state and local levels. The Revenue Sharing Act of 1972 distributed money to state and local governments with few strings attached, although a significant personnel issue was addressed by the prohibition of discrimination in jurisdictions using the revenue-sharing funds. The attempt to weaken the federal government's influence over other units of government set the stage for further developments in that direction during the 1980s.

The administration also ordered absolute veterans' preference for Vietnam veterans in grades 1 through 5 of the federal service. The Vietnam Veterans Readjustment Act (1974) required government contractors to give special consideration to those veterans.

The Nixon administration is probably best remembered in personnel management for direct challenges to the merit system. Frustrated by a bureaucracy the administration perceived as unsympathetic to its values, the administration developed an elaborate system for selecting people who were more politically supportive. A document known as the Malek Manual (Federal Political Personnel Manual 1976) was used by political operatives in the administration. Its use, along with the Watergate scandal of 1974, undermined the integrity of the public service and the public image of it again sank (Panetta and Gall 1971; Weisband and Franck 1975). As a result of these problems, ethics in the public service received a high level of attention (Bowman 1977; Stewart 1984).

Reflecting growing concerns with training and development, the Intergovernmental Personnel Act of 1970 provided money to state and local governments for training purposes. At the same time, organizational humanists were influential in training circles (Argyris 1973a, 1973b, 1983; Bennis 1973; Berkley 1971; Golembiewski and Eddy 1978; Golembiewski et al. 1981; Harmon 1981; Kaplan and Tausky 1977; Presthus 1978; Simmons 1981). The money funded many behaviorally oriented training programs at all levels of government. While specific skill training was done in some programs, the emphasis was clearly on more behavioral considerations. Motivation and productivity were central themes, along with organizational development (Newland 1972).

The capstone to the 1970s was the Civil Service Reform Act (CSRA) of 1978, the only major reform in ninety-five years (Ingraham and Ban 1984). The Carter administration was not like the Democratic administrations of the 1960s, or even those of the 1930s and 1940s, in its approach to government responsibilities. Like the Republican Nixon administration preceding it, the Carter administration wanted a reduction in the size of government. Carter came to the presidency viewed as an outsider by Washingtonians. He did little to ingratiate himself to those who wielded power and influence. As a result, his relationship with the civil service was not a very good one. Despite strong dissent from some (Rosen 1978, 1983), many in the public service supported his efforts for reform. A major cornerstone of his effort to make government more efficient and responsive was the Civil Service Reform Act, which he convinced Congress to pass.

The president set up a task force to conduct a thorough examination of all aspects of federal government personnel. The task force made its recommendations in 1977 and Congress passed many of them into law in the 1978 act (Ingraham and Rosenbloom 1992; President's Reorganization Project 1977). CSRA strengthened personnel management and integrated it more closely with the rest of the executive branch. Personnel was once again viewed as part of management.

At the same time, the act reorganized the personnel function by eliminating the Civil Service Commission and replacing it with several agencies. Three major agencies emerged in the reorganization. The Office of Personnel Management (OPM) became the major policy making arm of personnel and was directly responsible to the president. The Federal Labor Relations Authority (FLRA) was made a separate agency with responsibility for administration of the federal service's labor management relations program. The Merit Systems Protection Board (MSPB) was created to

protect employees from prohibited personnel practices. It served as an appeals board for employees but also monitored the overall implementation of personnel policies. It was charged with making annual reports on problems in the system.

The 1978 act also established the Senior Executive Service (SES). A concept going back at least as far as the Brownlow Committee, the SES allowed for flexibility in assignment of high-level employees. They could be assigned to take advantage of their special expertise wherever it was needed. The idea behind the system was to more effectively use the talent available and to avoid some of the red tape associated with the civil service system (Buchanan 1981; Colby and Ingraham 1982; Huddleston 1992; Long 1981; Pagano 1984; Rosen 1981; Waldby and Hartsfield 1984).

At the same time the CSRA was being passed, President Carter proposed stronger rules on conflicts of interest and other behavior of public employees. The Ethics in Government Act was passed in 1978, placing restrictions on post-government employment and requiring many public employees to divest themselves of investments, make public their financial statements, and refrain from participation in decisions in which a conflict of interest might appear (Walter 1981). The act was stimulated in part by the fallout from the Watergate scandal (Bowman 1977; Plant and Gortner 1981).

The reforms in civil service and the concern with ethics stimulated many state and local governments to action (Plant and Gortner 1981). While some predated the federal service in reorganization, most undertook studies of their systems after the 1978 act, and many made changes modeled on the new federal system (Dressang 1982). Many also adopted more stringent ethics laws (Hays and Gleissner 1981; Maletz and Herbel 2000). Open meeting laws and freedom of information or open access legislation were also part of the sunshine legislation movement to make government more accountable (Feinberg 1997).

The state and local levels were the leaders in another area of activity with important public service implications. Proposition 13, passed by California voters in 1978, stimulated the era of cutback management that is felt to this day. Taxpayer revolts spread across the country and governments suddenly found themselves under pressure to cut back expenditures. Because personnel costs represented the largest expenditure item for most governments, cutback meant reductions in personnel. Reductions-in-force, layoffs, and other forms of cuts forced a new examination of public services and the bases on which they operated (Koteen 1997; Lewis et al. 1983; Rubin 1985). Productivity improvement gained increasing attention as one means of coping with reductions.

B. MORE RETRENCHMENT: THE 1980s

The plight of the public service took a turn for the worse in the 1980s. The Reagan administration came to office partly on the basis of an attack on the public service. The attack was part of a larger broadside against big government (Levine 1986). Not surprisingly, the morale of the public service plummeted. In addition to portraying the civil service as a main culprit in what the administration considered to be wasteful government activity, the administration attempted to make the public service over in an ideological sense (Newland 1983). Congress and the courts became the sources of support for public employees.

The 1981 PATCO strike and the administration's handling of it symbolized the Reagan administration's approach. Although the Professional Air Traffic Controllers had endorsed Reagan in his bid for the presidency, it bore the brunt of the new values. Upon going on strike, the union was informed that employees would be fired if they did not return to work. That is just what happened after the administration succeeded in making the union appear unreasonable because of its pay demands. The union never could capture the attention of the public with what it considered to be its more important issues. With public opinion securely on his side, Reagan used PATCO as an example of how his administration would play hardball with public employees. Of course,

because the strike was illegal, the union had no solid ground to stand on, despite the fact that strikes throughout the public sector had been handled differently in the past, with employees being welcomed back after a settlement of the issues. The Reagan administration stood firm and PATCO was decertified. The message to public employee unions was clear, and they have not been very effective in pressing their demands at any level of government since. The phenomenal growth of public employee unions and collective bargaining was brought to an abrupt halt.

The insensitivity of many of Reagan's appointments to conflicts of interest further disheartened the public service (Newland 1983, 1987; Pfiffner 1987; Rosen 1983). Like Eisenhower in the 1950s, Reagan seemed to have a penchant for appointing people whose backgrounds had not been carefully checked or who behaved in office as if the department or agency with which they were associated was their own private domain. Once again, practices acceptable in private business proved to be unacceptable in the public service. Many of the appointees seemed not to be able to understand this, resulting in embarrassing episodes for the administration. The image of unethical behavior rubbed off on the public service as a whole. In 1989, the Ethics Reform Act was passed, strengthening some of the rules governing employee behavior.

The administration also made a major issue of deemphasizing equal employment opportunity and affirmative action (Krislov and Rosenbloom 1984; Thompson 1984). It entered court cases in support of overturning such efforts, thereby alienating many state and local governments that earlier had established equal employment opportunity and affirmative action programs at the demand of the federal government. Many also felt that such efforts were right, given concerns with equity and justice and recognition of demographic changes. They resented having to now defend against efforts by the administration and others to dismantle the programs they had been pressured to develop in the first place. Employee organizations and unions began to embrace affirmation action and equal employment opportunity.

Comparable worth has been described as the issue of the 1980s and was an extension of the equal employment opportunity commitments of three decades earlier (Doherty and Harriman 1981; Johanson 1984a, 1984b; Moore and Abraham 1994; Neuse 1982; Remick 1981; Steel and Lovrich 1987; Tompkins 1987). Among the leading proponents of comparable worth are employee unions, especially the American Federation of State, County, and Municipal Employees.

The Reagan administration also was a strong advocate of government cutback (Levine 1986; Rubin 1985). Along with that went personnel cuts. While the national government was able to cut back on many programs, and particularly the funding of social programs, state and local governments were forced to take up the slack (Ciglar 1994; Conlan 1998; Hulten and Sawhill 1984; Nathan et al. 1983; Palmer and Sawhill 1984; Rivlin 1992; Wallin 1998). Many state and local government officials supported the idea of cuts, but the fact is that public agencies at those levels had to deal with increased demands for services while having fewer resources with which to deliver them. They faced issues concerning their capacity to perform the functions devolved to them. Capacity remains an issue for state and local governments.

Sexual harassment is another concern that received increasing attention as a result of changes in the workforce (Dressang and Stuibler 1991; MacKinnon 1979; Neugarten and Shafritz 1981; Ross and England 1987). In 1986, the US Supreme Court explicitly accepted *quid pro quo* and *hostile environment* harassment as illegal (*Meritor Savings Bank v. Vinson* 1986). *Quid pro quo* harassment refers to situations in which employment decisions are dependent upon sexual favors, and *hostile environment* harassment refers to a work environment in which such things as suggestive comments, touching, leering, and offensive materials make individuals uncomfortable or create feelings of intimidation (MacKinnon 1979).

Rights issues are always important concerns with public employees because of the need of public agencies for public support. In the 1980s, drug use among public employees led to suggestions for testing all public employees or for random testing. Similarly, polygraph tests were suggested as screening devices for potential employees. Of course, employees and their unions usually were hesitant to accept such proposals. Civil liberties questions concerning such programs

received a great deal of attention (Elliott 1989; O'Neill 1993; Thompson et al. 1991). Public and private employers also created employee assistance programs, in part to address problems identified by substance abuse tests (Johnson 1986; Kemp 1985). These programs dealt with problems employees had that might affect their abilities to be productive.

The Civil Service Reform Act of 1978 laid the groundwork for innovation and experimentation in public personnel management during the 1980s. For example, some federal agencies and many state and local governments experimented with merit pay or pay-for-performance systems. Pay-for-performance appealed to many public officials. It was difficult to imagine anyone not wanting to reward performance. However, implementation was another story. Lack of agreement on what constituted meritorious performance and reluctance of political decision makers to dedicate the kinds of funds to make merit pay significant led to lack of success of most pay-for-performance systems. The promise of such systems was much greater than the reality of their implementation (Bernadin et al. 1998; Ingraham 1993; Kellough 2002; Kellough and Lu 1993; National Research Council 1991; Perry 2003).

Experiments in classification reform and pay banding also emerged during the 1980s. In several federal installations, efforts were made to find ways of making classification and compensation systems more flexible. While the experiments led to some successes, efforts to broaden their use have not been readily accepted (Ban, 1991; Beecher, 2003; National Academy of Public Administration 1983, 1991, 1995; Risher and Schay 1994).

As the 1980s ended, George H. W. Bush was president and generally followed the approaches developed by the Reagan administration. However, the rhetoric bashing of the public service was noticeably lacking in his administration. While the conservative wing of his political party pressured him to maintain many of the policies of his predecessor, the tone of his administration was much less harsh.

V. THE 1990s AND BEYOND: REINVENTION, REENGINEERING, AND DOWNSIZING

The 1990s began with a continuation of the retrenchment and cutback focus of the 1980s. As the decade progressed, the attacks on government escalated and the political environment also generated reactions to many programs fostering social equity. While Bill Clinton retook the presidency for the Democrats running for office on a platform that included reaching out to all segments of society, he quickly encountered resistance. The midterm elections of 1994 resulted in a Republican majority in Congress controlled by the conservative wing of the party. Anti-government rhetoric dominated the political agenda, and the president began wavering in his support of moderate and liberal policies. For public personnel management, the implications were and are many. While the major focus was on cutting back the scope and size of government, many activities have been aimed at improving government performance and achieving savings through such efforts. Thus, reinvention and reengineering became the fads of the 1990s, using Total Quality Management and variations of it as the tool for accomplishing the objectives.

In 1989, the National Commission on the Public Service (Volcker Commission) issued a report entitled *Leadership for the Public Service* that stimulated much analysis of personnel systems, especially at the national level. It was followed by the National Commission on the State and Local Public Service, which published a report in 1993 paralleling the Volcker Commission's recommendations. President Clinton appointed Vice President Al Gore to head the National Performance Review, which issued reports in 1993 and 1994 focusing on approaches to reinventing and reengineering government agencies and programs. All of these reports incorporated elements of quality management approaches. Streamlining and cutting back were results of the efforts, but the primary focus was on improving performance of agencies and personnel

(Ingraham et al. 1994). Studies of and recommendations for improving all aspects of personnel administration continue (Light 1999; National Academy of Public Administration 2004).

Changing demographics put new pressures on personnel systems to accommodate a workforce that was increasingly older, better educated, more diverse, and more white collar (Dolan 2004; Dolan and Rosenbloom 2003; Hudson Institute 1988; Light 1999; Pomerleau 1994; US Office of Personnel Management 1993). The changing nature of the workforce challenged public personnel management in many ways. Organizations found that they had to sensitize managers and employees to the diverse workforce and ensure that the work environment was comfortable for all. The contemporary workforce had very different expectations of the employer organization. They expected more opportunity for participation in decisions affecting them. They also expected to change jobs/careers several times in their lives. These expectations created major challenges for employers (Light 1999).

Equal employment opportunity and affirmative action programs were major elements of public personnel systems by the early 1990s. The Civil Rights Act of 1991 strengthened enforcement of anti-discrimination policies and permitted collection of compensatory and punitive damages for discrimination. It also called for establishment of a Glass Ceiling Commission to deal with lack of advancement opportunities of women and minorities above certain levels in management (Guy 1993).

Starting in the mid-1990s, opponents of affirmative action programs launched an all-out assault. As the political system approached the 1996 presidential elections, candidates staked out their positions in response to the conservative swing apparent in the 1994 midterm elections. Republican candidates attacked affirmative action programs, with Governor Pete Wilson of California leading the way. He convinced the University of California Board of Regents to abandon affirmative action programs for their campuses. President Clinton, mindful of the saliency of the issue, ordered a review of affirmative action programs in the federal government and eventually went on record in strong support of improving but not abandoning affirmative action. The courts became more open to challenges to such programs as well.

George W. Bush became president after the 2000 election. Clearly, he did not support affirmative action and worked to undermine its use. Some states, such as California and Washington, adopted policies prohibiting use of affirmative action, and court decisions generally applied a very strict scrutiny standard. However, the US Supreme Court did approve of affirmative action in law school admissions at the University of Michigan (*Grutter v. Bollinger* 2003). Scholars debate the applicability of the decision to personnel matters, but clearly, the Court has indicated that some forms of affirmative action are acceptable (Sisneros 2004).

As part of the equal opportunity debate, people with disabilities have pressed for their rights. The Americans with Disabilities Act of 1990 was passed and has had immense implications for public personnel (Cozzetto 1994; Crampton and Hodge 2003; Kellough 2000; Mani 2003). All aspects of personnel systems are subject to analysis to ensure that they are not discriminatory against those with disabilities.

Gays and lesbians also began asserting their rights as American citizens. They were encouraged by candidate Clinton, who promised to support their interests and to lift the ban on gays and lesbians in the military. President Clinton, however, backed down from his position in the face of major political opposition, including opposition in his own party in Congress. A compromise allowed gays and lesbians to serve in the military as long as they did not publicly discuss the fact that they were gay or lesbian. Their superiors were not supposed to ask about sexual orientation either. Many state and local governments are now the arenas for policy on the issue. Many jurisdictions have passed laws or ordinances protecting gays and lesbians against discrimination, but some have generated citizen initiatives that rescind such policies or prohibit establishment of them. In 2004, gay marriage arose as a hot-button issue in the election campaigns and is having implications for personnel policies, especially regarding benefits. Litigation over the policies is prevalent; thus, there is as yet no definitive approach to dealing with the rights of gays and lesbians in public

employment (Lee and Greenlaw 1995; McNaught 1993; Simon and Daly 1992). Domestic partnership policies extending to domestic partners the same benefits provided to spouses often are debated with major gay and lesbian undertones, although the policies often extend to heterosexual relationships as well (Gossett 1994; IPMA HR Center 1996).

Harassment is another equity issue that has been highly visible. Harassment is “repeated and persistent attempts to torment, wear down, frustrate, or get a reaction from another. It is treatment that persistently provokes, pressures, frightens, intimidates, or otherwise discomforts another person” (Brotsky 1976). Employees may experience harassment because of their race, ethnicity, religion, gender, or sexual orientation. Women have been subjected to harassment since they became part of work forces (Newman et al. 2003). The Civil Rights Act of 1964 and the Equal Employment Opportunity Act of 1972 dealt with broad aspects of harassment in the workplace, but it took much effort on the part of organizations such as the National Organization for Women to draw attention to the sexual exploitation of women in the workplace. Eventually, the Equal Employment Opportunity Commission defined sexual harassment as a violation of federal law and published guidelines defining sexual harassment as “unwelcome advances, requests for sexual favors, and other verbal or physical conduct of a sexual nature...when submission to or rejection of this conduct explicitly or implicitly affects an individual’s employment, unreasonably interferes with an individual’s work performance or creates an intimidating, hostile or offensive work environment” (US Equal Opportunity Commission, 1980).

The extent of sexual harassment is difficult to measure, but various surveys and studies indicate that it is a serious problem in employment, with as many as 50% of women and 40% of men reporting having been the victim of sexual harassment (Gutek 1985; Hoyman 1998; Reese and Lindenberg 1997; Selden 2003; US General Accounting Office 1995; US Merit Systems Protection Board 1995). Employers have a responsibility to develop a policy on sexual harassment and to communicate it clearly to everyone in the organization. The courts often hold employers liable for damages if they do not make good faith efforts to prevent sexual harassment and/or to correct it if it has occurred (*Harris v. Forklift Systems* 1993; *Meritor Savings Bank v. Vinson* 1986; *Ellison v. Brady* 1991). The Civil Rights Act of 1991 allows harassed employees to sue for as much as \$300,000 in punitive damages in addition to any back pay and attorney’s fees. In 1998, the Supreme Court ruled that same-sex harassment also is covered under the Civil Rights Act (*Oncale v. Sundowner Offshore Services, Inc.*, 1998).

Employee benefits emerged as a major personnel issue in the 1990s (Cayer 2003). The costs of health care benefits increased dramatically during the 1990s and continue unabated. Employers responded by redesigning health care benefits. Health Maintenance Organizations (HMO) and Preferred Provider Organizations (PPO) became the dominant health care plans, displacing the traditional indemnity insurance plans. Employers also now increasingly require employees to share in the cost of premiums and include fees (copays) for services as a way of reducing costs. Flexible plans also have become staples, as employees can choose only the benefits of most value to them.

Employers now offer many benefits as family-friendly benefits packages (Cayer 2003). The Family and Medical Leave Act of 1993 requires all employers of at least 50 people to allow up to twelve weeks of unpaid family and medical leave in any twelve-month period. In 2002, California adopted the first paid family leave policy, providing employees 55% of their pay for up to six weeks.

Violence in the workplace now costs employers more than \$40 billion annually, with more than two million victims (Injury Prevention Research Center, 2001; *IPMA News*, 1999). Employees and employers experience attacks from stressed colleagues, family members, and clients (Elliot and Jarrett 1994; Johnson and Indvik 1994). Employers find it necessary to implement programs to help avoid the violence and to deal with the aftermath of incidents of violence (Bowman and Zigmond 1997; Chernier 1998). The issue has spawned efforts to assess the potential for violence and what steps might be taken to prevent it. Training programs help supervisors and employees to recognize

the signs of stress and behavior that can lead to violence. Employers also now have to provide security and support for employees who work with victims of such violence.

The challenges for personnel management in the contemporary workplace are many. The political and demographic shifts keep public personnel a dynamic field. The image of the public service continues to suffer, especially because presidential administrations seem to have a penchant for getting mired in controversies over the actions of many of their appointees and nominees. In the George W. Bush administration, investigations concerning influence by special interests in energy and environmental policy have tainted the public service. The scandals involving abuse of prisoners in Iraq and contracts for rebuilding and other activities in Iraq have further demeaned the public service as questions arise as to who approved such actions. While the focus is on elected and politically appointed officials, the general public rarely makes a distinction between them and the public service overall. The result is a lessening of confidence in the public service, making it more difficult for it to fulfill its role.

The Bush administration developed “Strategic Management of Human Capital” as the theme for its approach to public personnel management (Abramson 2002; US General Accounting Office 2002). The approach focuses on recruiting high-quality employees and creating strategies for motivation and performance. Part of the strategy is to reduce the rules protecting public employees, including collective bargaining rights, and make them more responsive to elected officials, as was done with the creation of the Department of Homeland Security.

The Bush administration has also promoted privatization, promising to privatize as much as 50% of public employment. Many state and local governments also engage in contracting or privatization of public services, often because they anticipate savings on personnel costs (Brown and Potoski 2003; Chi et al. 2004). Privatization presents many challenges, as employers need new sets of tools to develop requests for proposals, evaluate bids, and negotiate and monitor contracts (Cooper 2003; Kettl 1993; Van Slyke 2003). Unions also generally oppose privatization; thus, employers have labor relations issues to address as well.

Reform is a constant for personnel systems. Some contemporary reforms have replaced civil service systems with performance-based approaches (Chi 2004; Scott 2004). The idea is to reduce the protections to public employees and focus on performance outcomes. Thus, Georgia and Florida have eliminated their civil service systems, and other states, such as Texas, have made major changes to their systems. The reforms reignite the debate about the proper balance between a neutral service and political partisanship because of the potential for political abuse (Condrey and Maranto 2001; Kellough and Selden 2003).

VI. SUMMARY

Public personnel management in the United States has undergone continual change (Ingraham et al. 1994; Lane and Wolf 1990; Light 1999; McEnery and Lifter 1987; Rothwell et al. 2000; Woolbridge and Wester 1991). The change is usually in response to changing political values. The political values of the very first administrations involved gaining support for the new system, and every administration since has had some concern with getting public employees to buy into its value system. Otherwise, it is very difficult to have a responsive public service. The extent to which the public service should be responsive to the administration has been continually debated. The nation has swung from extremes of responsiveness (unmitigated spoils) to extreme neutrality (the early twentieth century). Each time, there is a reaction that swings the pendulum back to some extent.

The early literature of public personnel management focused on descriptions and analyses of specific personnel systems or problems. Thus, the civil service system might have been examined or spoils might have been profiled. However, there was very little in the way of formal consideration of the role of personnel in overall management. Woodrow Wilson (1885) provided an intellectual

justification for the reform movement of four years earlier and has been used as a major centerpiece of the civil service system. The literature of the early nineteenth century built upon that approach, along with the scientific management principles of management approach. Until the 1960s, separation of politics and administration was accepted as a given in public personnel management (Rosenbloom 1982).

The literature of the 1960s began to question the separation of politics and administration or policy and administration. With that change came recognition of the fact that public personnel management was shaped by political values. Mosher (1968) led the way, and Thompson's (1975) classic *Personnel Policy in the City* made one of the most articulate cases for the premise. Criticism of the field as being devoid of theory and dull and plodding, among other things, was a challenge to public personnel management as well (Klingler and Nalbandian 1978; Milward 1978; Rosenbloom 1973; Shafritz 1975). The literature of the 1970s and 1980s represents a much more research-oriented approach and is based on placing public personnel management into the context of the politics and public policy in which it operates (Cayer 2003; Elliot 1985; Klingner 1981; Mainzer 1973; Nalbandian and Klingner 1982; Rich 1982; Rosenbloom 1973; 1982; Stein 1987; Thompson 1975, 1991, 1995).

In modern-day recognition of the centrality of politics in the personnel process, we have come full circle from the beginning days of the nation. Public personnel management is both politics and administration, with the balance between the two being one of the central questions for scholars and personnel managers (Ingraham and Kettl 1992; Ingraham et al. 1994; Klay 1983; Macy et al. 1983; Newland 1984a; O'Toole 1987; Thompson 1995). Building an effective organization requires both internal and external political skills (Carnevale 1995). Contemporary challenges arise from the changing values of the population served by and making up the public service (Light 1999). Public personnel management must accommodate high expectations for performance with changing employee expectations about their participation in decision-making and recognition of their needs as well. Governments at all levels continually reform their systems to accommodate changing values and political forces (Beecher 2003; Butcher and Massey 2003; Condrey and Maranto 2001).

I. INTRODUCTION

Two ideas are widely held by the American taxpayer. He believes there is an extraordinary number of useless or overpaid public officials, and he is convinced that most government employees are lazy or incompetent, and secured their positions only by 'pull.' Two ideas are likewise held by civil servants. They assert that they are underpaid, and they believe that the value of their work is neither understood nor appreciated by the public (White 1926).

Leonard White's description of the divisiveness in opinion over public employment during the first quarter of the twentieth century is timeless: the public's lament over the bureaucracy versus the administrator's anguish over the thankless nature of the job. Yet over the course of the last one hundred years, few professions have undergone such substantial change, definition, and redefinition. At the beginning of the twentieth century, the understanding of structure, process, and behavior in complex organizations was rudimentary and intuitive. Yet with each successive decade, the criticality of managing such organizations and their personnel has become increasingly manifest. This quest has spawned numerous theories, concepts, and controversies, many of which have been seminal in their impact. This chapter will undertake to identify those major concepts that have most profoundly affected the scope and substance of the public personnel function.

As is usual with such a venture, all academic caveats regarding objectivity apply. Identifying the major concepts or themes as the most illustrious achievement managerially is an exercise fraught with bias and speculation. Each generation of scholars and practitioners has championed their own thematic agenda, with only a few ideas receiving enduring attention. Still, across the years, certain core tenets have survived intergenerational scrutiny and served to shape the study and practice of public personnel.

First, a word of explanation should be offered regarding the criteria used to select these themes or issues. As with previous versions of this chapter, each issue presented is assessed on the basis of its ability to satisfy four requisites: permanent impact, application to the practitioner as well as the academic community, a predominantly public sector focus, and a lasting contribution in furthering personnel thought and practice.

Since the beginning of the previous century, five visible themes in public personnel administration have met these criteria. Chronologically, these are (1) the establishment and refinement of the civil service and merit concepts, (2) the development of the human relations and workplace quality movements, (3) the emergence of public bilateralism, (4) the quest for representativeness, and (5) the recognition of the professional public administrator.

The five issues collectively define the essence of contemporary public personnel administration. Individually, however, each issue represents a curious view of the frequently incongruous values and principles reflected in the development of this country's public employee systems.

II. THE ESTABLISHMENT AND REFINEMENT OF THE CIVIL SERVICE AND MERIT CONCEPTS

The theme of civil service development and reform defines the very essence of the modern public personnel system, with the merit principle serving as its core component. While there are many historical antecedents for such reform, the wellspring legislation in the American experience was the Pendleton Civil Service Act of 1883. In addition to recognizing merit as the compelling criterion for personnel decisions, the act initiated the advent of the bipartisan personnel commission, a concept designed to moderate the influence of overt patronage pressures. The commission bestowed a modicum of impartiality, or at the very least balanced partiality, on the governance of the civil service system (Van Riper 1958).

Mosher (1968, 65–66), contends that there were three basic themes comprising the campaign that led to the adoption of the Pendleton Act. These themes explain the genesis of civil service, as well as governmental reform. First, he argues that personnel administration, or what passed for it at the time, was associated with the concept of morality. Second, and a distant second according to Mosher, its adoption was influenced by a concern for more efficiency. Finally, the movement for civil service reform was an effort “to eradicate evil.” The first and third themes illustrated the tendency to elevate public personnel to a higher plane by legislating away corrupt influences. The second theme, arguably the least visible of the three, represented an attempt to select more capable personnel for government employment.

While these two intentions were certainly not antithetical, each accentuated a distinctly separate pattern characteristic of subsequent reform efforts. In the case of the purification orientation, emphasis was placed on controlling the personnel system in order to eliminate such negative forces as corruption, as well as the destabilizing influence of political pressure. The second orientation focused more deliberately on improving the personnel system through developmental change. In the years following, efforts were undertaken to arrive at a workable concept of merit and to apply this concept to selection and promotion decisions. On the whole, the successes related to both pursuits have been both systematic and sustained, although not without an occasional setback.

Wilson's (1887) classic essay, "The Study of Administration," published in the wake of the Pendleton Act, perpetuated the purification theme by drawing a conceptual distinction between the avocation of politics and the profession of administration. Of the latter, Wilson wrote:

The field of administration is a field of business. It is removed from the hurry and strife of politics; it at most points stands apart even from the debatable ground of constitutional study. It is a part of political life only as the methods of the counting-house are a part of the life of society; only as machinery is a part of the manufactured product. But it is, at the same time, raised very far above the dull level of mere technical detail by the fact that through its greater principles it is directly connected with the lasting maxims of political wisdom, the permanent truths of political progress (Wilson 1887).

As to the difficulty and value of administrative as compared to political labors, Wilson advised that:

This is the reason why administrative tasks have nowadays to be so studiously and systematically adjusted to carefully tested standards of policy, the reason why we are having now what we never had before, a science of administration. The weightier debates of constitutional principle are even yet by no means concluded; but they are no longer of more immediate practical moment than questions of administration. It is getting to be harder to run a constitution than to frame one (Wilson 1887).

Within two decades, Frank Goodnow had joined this argument by calling for the removal of politics from administration in his aptly-titled book, *Politics and Administration*. Goodnow viewed the functional distinction between the two as an extension of the structural division between the legislative and the executive branches. Thus politics involved "policies or expressions of the state will," while administration involved the "execution of these policies" (Goodnow 1900, 10–11).

Both of these viewpoints conveyed an explicit assumption regarding public personnel and the civil service system. Such a system, in order to be effective, must enjoy considerable autonomy from political decision-making. Wilson summed it up adequately in his remarks on civil service reform:

Most important to be observed is the truth already so much and so fortunately insisted upon by our civil-service reformers; namely, that administration lies outside the sphere of politics. Administrative questions are not political questions. Although politics sets the tasks for administration, it should not be suffered to manipulate its offices (Wilson 1887).

The purification theme dominated throughout the latter part of the 19th century, and became one of the more visible issues advocated by municipal reform proponents. Martin Schiesl's history of the municipal reform movement, *The Politics of Efficiency*, discusses in detail the emphasis placed on the development of nonpartisan employee systems during this era. However, Schiesl is careful to point out that political reformers were hesitant to extend the argument for nonpartisanship beyond appointive positions to include elected officials. Wary of the constraints imposed by nonpartisan restrictions, "reformers chose to be the sponsors of the new system rather than the tools of it" (Schiesl 1977, 34–36). Presumably, there was a juncture at which politics and administration merged; perhaps in the appointment of public employees, perhaps in their removal. Any effective civil service system must, on the one hand, shield appointed employees from obtrusive political pressure and yet, on the other hand, ensure that elected officials possess sufficient authority to direct these employees.

The topic of political control became the subject of intense debates within the National Municipal League and other regional reformist organizations such as the Massachusetts Reform Club, New York's Constitution Club, and the Chicago Civil Service Reform League (Schiesl 1977, 25–45). The various organizations uniformly agreed that efficiency and responsiveness were the virtues to be acquired; the dilemma was how to obtain both while eliminating the spoils system. Gradually, but perceptibly, the concept of merit became recognized as an instrument for depoliticizing public personnel systems. Although subsequent efforts at modeling the theoretical

underpinnings of merit have identified certain tenuous, yet inextricable, linkages between political pressure and merit adaptability (Nalbandian and Klingner 1981), reformists at the time argued vehemently for merit-based rules, regulations, and procedures.

The concept of merit in personnel administration has been poorly defined and largely misunderstood. At various times the term has been used interchangeably with terms such as qualification, ability, and competition. O. Glenn Stahl, in his classic text on personnel administration, defines the merit system as “a personnel system in which comparative merit or achievement governs each individual’s selection or progress in the service and in which the conditions and rewards of performance contribute to the competency and continuity of the service” (Stahl 1976). From the passage of the Pendleton Act, the presence of merit in a personnel system has been traditionally confirmed through a reliance on open and formal examinations. The implication was apparent: whatever merit encompassed and however it worked, the concept could be realized best through the imposition of objective measures. In view of the highly subjective hiring and promotion decisions made in spoils administrations, it is not surprising that the examination would be viewed as a panacea for eliminating patronage and favoritism.

Although the use of examinations to hire civil servants was distinctly British in origin, the examinations required by the Pendleton Act were to be “practical in character,” thus providing a uniquely American perspective to this concept (Henry 1986). The practical examination was certainly intended to make selection decisions on the basis of some type of work-related knowledge or skills, however ill-defined. Unfortunately, the early tests were so primitive that they fell considerably short of fulfilling most merit-based expectations. They simply served to affirm the contention of the reformers that “chance selection is better than patronage selection” (Wentworth 1968).

In time, the administrative benefits of examinations were more fully realized, as personnel specialists better understood the concepts of test validity and reliability. The creation of the Federal Service Entrance Examination in 1955 and its successor, the Professional Career Administration Examination in 1974, typified the attempt to develop more sophisticated and accurate test instruments. Despite the trend in the past few years to move away from the written examination because of methodological concerns and accusations of racial bias (Rosenbloom and Obuchowski, 1977), tests played a key role in the early development of the merit principle.

In a similar vein, standardized classification and compensation systems lent substance to the merit idea by creating uniformity in titles, position responsibilities, and pay. The Classification Act of 1923 was responsible for incorporating this essential component into the federal civil service system, while the Social Security Act, as amended in 1939, led to the creation of a number of state merit systems. Subsequent legislation, such as the Fair Labor Standards Act of 1938 with its various amendments, attempted to establish an equitable basis for remuneration. While this act, in particular, has pursued a circuitous route in addressing this issue, both in the Congress and in the courts, (Davis and Murphy 1985; Elder and Miller 1979), it signifies an effort at compensatory reform nonetheless.

The evolution of the personnel department itself should not be overlooked as a critical element in the maturation of the civil service system. Despite the fact that Congress in 1937 rejected the Brownlow Committee’s recommendation for a single, appointed civil service administrator (President’s Committee on Administrative Management 1937), Roosevelt did create personnel departments in the major federal agencies the following year. In the post-World War II years, these departments were delegated increased authority, and finally, the Classification Act of 1949 ceded them the responsibility for allocating individual positions within the standards set by the Civil Service Commission (Siegel and Myrtle 1985).

Of course, no discussion of civil service reform initiatives would be complete without a consideration of one of the more controversial reforms of the twentieth century, the Civil Service Reform Act of 1978. According to Alan Campbell, then-chairman of the Civil Service Commission and subsequently director of the Office of Personnel Management, the act was

designed in such a manner as “to improve management, stimulate performance and efficiency, provide needed protections for employees, and help achieve the equal employment expectations to which the federal service is committed and the public is entitled” (Campbell 1978).

In essence, the act effectively restructured the federal personnel system by eliminating the archaic Civil Service Commission and splitting its functions between two new agencies: the Office of Personnel Management (OPM), the administrative element, and the Merit Systems Protection Board (SPB), the body for hearing and resolving personnel grievances. Also included was the provision for a special counsel who would serve a five-year fixed term. The special counsel would investigate federal agencies who allegedly engaged in prohibited personnel practices. In addition, the act established a new personnel system for senior policy-making administrators, the Senior Executive Service (SES). New performance standards and evaluative processes were created for these executives, and merit-pay incentives were developed for them, as well as for senior-level managers in levels GS 13–15.

Almost immediately, a number of criticisms arose over various aspects of the act. Among the criticisms were the contentions that the valuation system provided political appointees too much power over career executives (Rosen 1978), that the act did not enumerate priority concerns for minorities and women (Howard 1978), and that it placed a “narrowly-based emphasis upon efficiency” (Thayer 1978).

The criticisms of legal, political science, and public administration researchers have become even more intense with the passage of time. Pearce and Perry (1983) concluded, as a result of longitudinal analyses, that the merit pay concept “at grades 13–15 has not been sufficiently successful to proceed with plans to include employees in grades 1–12.” In a survey of SES executives in the period immediately after the act’s passage, Lynn and Vaden (1979) found that a substantial percentage of the career bureaucrats were uncertain about job security, thus producing a potentially demoralizing situation. Others, including Huddleston (1982), have continued to question the power of political appointees over career administrators. Huddleston, in fact, characterized the OPM as a “partisan political organization that has a partisan political function.” Charles Levine has also deplored the “increased ‘politicization’ of the higher civil service and the more extensive use of central controls by OMB to shape the policy agendas of departments and agencies” (Levine, 1986, 201).

Defenders of the Civil Service Reform Act have become increasingly vocal in responding to these charges. Dwight Ink, a Carter administration official with key responsibility for the legislation, points out that the reform measures were developed through an open, deliberative process that focused on the ills of the existing personnel system. He blames many of the problems associated with the act on “poor agency management and weak leadership,” rather than on the legislation itself (Ink 2000, 55). Ink argues that evaluation of the CSRA should be based on facts, not assumptions, and that critics should focus less heavily on specific passages and more on the overarching objectives of the Act’s creators.

A recent Princeton survey of federal employees found that concerns regarding the civil service are not limited to academicians. Paul Light (2001) has used the survey data to chronicle the growing gap in job satisfaction between the public and private sectors. He attributes much of the organizational ennui to a “personnel system last overhauled in 1978 based on ideas from the 1950s that were built on research conducted in the 1930s, using data collected in the 1920s by scholars trained in the 1910s.”

In light of these concerns, civil service reform has emerged as a major issue at the state and local government level since the passage of the Civil Service Reform Act. In the past few years the reform of archaic and obsolete state and municipal personnel systems has been of particular interest to a growing number of elected officials (Nigro and Nigro 1981). A number of such jurisdictions have completed, or are presently in the process of completing, reform initiatives, such as the repeal of nepotism laws and the adoption of merit-based compensatory and evaluative processes. These initiatives have, in turn, generated scholarly efforts to rank the states based on innovation in public

personnel administration (Kellough and Selden 2003). Such rankings are watched with great interest by the state practitioners.

Of continuing concern, however, is the politicization reflected in the substantial number of elected executive officials at the state and local levels. The long ballot concept has continued to impede systemic reform of the truncated and fragmented personnel fiefdoms that such officials direct. Even in those instances in which employees are ostensibly afforded merit protection, electoral cycles introduce unique stresses in which the distinction between political loyalty and managerial accountability is blurred.

While research, such as that conducted by Conant (1988), affirms the success in achieving executive branch reorganization at the state level, questions remain as to the degree of administrative efficiency and effectiveness achieved in these efforts. Yet, as Conant points out, in the absence of “a definitive answer to the perplexing question about the bottom-line results of comprehensive reorganization... no compelling reason exists for reformers to abandon the pursuit of a modernized, streamlined, executive branch or strong executive leadership.” Indeed, the lessons of the past clearly illustrate the necessity for executive centralization and leadership as a prerequisite for meaningful civil service reform.

During the waning decades of the late twentieth century, two presidential study initiatives raised the specter of federal government reform in differing, although compatible contexts. Additionally, both examined the public personnel function and its relationship to governmental reform *sui generis*. The first of these, Ronald Reagan’s Private Sector Survey on Cost Control, was chaired by business executive J. Peter Grace. This initiative, conducted from 1982 to 1984, produced over 47 reports and was an unabashed critique of governmental process and function. The final Grace Commission report stated that as much as 21.4% in projected savings could be derived by correcting personnel mismanagement problems (Goodsell 1984). However, by the late 1980s, few of the Grace Commission recommendations had been implemented. Perhaps, as Arnold (1995) subsequently observed, “because they were really intended to castigate government and not change it.”

A markedly different tack was attempted with Bill Clinton’s National Performance Review in 1993. Chaired by Al Gore, this panel embarked on a reform planning effort intended to examine both the ends and means of government. The tone of the panel was less caustic than that of the Grace Commission, but its final messages and symbolism were no less pejorative:

From Red Tape to Results was issued on September 7, 1993. The semiotics of its public presentation offers a glimpse into the implicit political goals of the National Performance Review. With officials and press present on the White House lawn, President Clinton and Vice President Gore stood against a backdrop of forklift trucks loaded with volumes of federal budget rules, procurement rules and personnel rules (Arnold 1995).

The ensuing reform effort was not well received by those on the federal payroll. Fully half of all general schedule employees reported that the Clinton-era initiative made their jobs *more* difficult. As Light (2001) notes, “[S]o much for reinvention’s promise of empowerment and efficiency on the front lines of government.”

The move to streamline government and to downsize public payrolls, although checked somewhat by expansion of the national security agencies in the wake of the terrorist attacks of September 11, 2001, continued under the administration of George W. Bush. *The President’s Management Agenda*, released in 2002, repeated the well-worn call to reduce middle-management positions in government and to accelerate the trend toward outsourcing federal functions. These recommendations were hardly surprising, given the prevailing political climate and Bush’s status as America’s first MBA president.

Whatever the value of these initiatives, it is clear that they are not without consequence for the public employee striving for merit excellence. Arnold (1995) warned that “the contemporary use of reorganization to displace political disquiet about big government only serves to undermine the

legitimacy of public administration.” At the very least, such efforts appear only too willing to sacrifice merit-based systems on the altar of political expediency. On the related issue of downsizing the public sector workforce, Kettl et al. (1996) suggest that “tallying the body counts” has become a political end in itself. Consequently, there is little discussion about the deeper problems that inhibit the ability of public sector organizations to function effectively.

As an enduring issue, civil service/merit/personnel reform has resulted in consistent and systematic change in the perception of the public servant. Over the past century, the selection and promotion criteria for public employment have tightened, and the demands placed on the public employee have intensified. It is nevertheless disconcerting to note that the three persistent challenges remain: the need to control political influence, the question for a better realization of the elusive notion of merit, and a more refined appreciation for the use of reform as a viable change strategy.

III. THE DEVELOPMENT OF THE HUMAN RELATIONS AND WORKPLACE QUALITY MOVEMENTS

The second notable issue involves the collection of theories and concepts which the social sciences have generally referred to as the human relations movement. While the effects of civil service reform were realized primarily as a result of legislative action, the human relations movement has evolved as a progression of scholarly ideas and opinions. As a consequence, the impact of human relations is better understood as a process of challenge and counterchallenge to orthodox thought rather than as a process of orderly and systematic change.

Of no less importance over the past decade has been the advent of the quality movement in American public administration. Distinctly humanistic in its orientation toward both subordinate employees and clientele (customers), the movement has attempted to undertake a no less ambitious task than the “reinvention” of government itself to produce more anticipatory and more entrepreneurial processes (Osborne and Gaebler 1992).

The departure point for the human relations perspective and much of the change that it produced was the Western Electric experiments, conducted at the Hawthorne Works in Cicero, Illinois, from 1929 to 1932. In the course of these experiments, Elton Mayo and a team of researchers from the Harvard Business School redefined the basic assumptions pertaining to worker productivity in complex organizations. In the process, they enhanced our understanding of the informal group and taught the importance of unobtrusive employee reward structures (Roethlisberger, 1941; Roethlisberger and Dickson 1939). Fortunately for successive generations of academic consultants, their efforts also served to affirm the value of the university as a center for applied behavioral research.

In many ways, the Western Electric studies substantiated the earlier contentions of scholars such as Mary Parker Follet and Henri DeMan. In arguing against the mechanistic-oriented “scientific management” approach prescribed by Taylor (1911), Follett urged that “one person should not give orders to another person, but both should agree to take their orders from the situation” (Follett 1926). Follett clearly viewed individual workers as being participants in determining their own work environment and, ultimately, their organizational destiny. Just as importantly, Follett viewed the needs of the organization and the needs of the individual as being compatible. Consequently, the wills evident at each of the two levels, individual and organization, had to be integrated in a manner that would allow both to be addressed through routine work processes. This task of integration was the responsibility of leadership, and according to Follett, a successful leader “knows how to relate these wills so that they will have a driving force” (Follett 1940).

Henri DeMan’s work was focused more specifically on analyzing the attitudes of German workers toward their daily labor. Relying heavily on the interview technique, DeMan concluded that the attempt to find “joy in work” was a natural instinct, influenced by both positive and negative factors in the workplace (DeMan 1929). DeMan’s findings have been favorably compared with the “hygiene-motivation” theory espoused by Frederick Herzberg three decades later (Wren 1972).

The issue of compatibility, primarily compatibility between organizational and individual needs, wants, and goals, has been an essential facet of the human relations approach. From the perspective of personnel administration and labor relations, such compatibility serves as a constant reminder that the organization need not be antithetical to the natural human experience; instead, it should be a meaningful part of that experience. The Western Electric researchers foresaw a new era of “collaborative” relationships between employees and organizations. However, as Roethlisberger cautioned, this was a form of collaboration quite different from that to which management had become accustomed:

Too often we think of collaboration as something which can be logically or legally contrived. The Western Electric studies indicate that it is far more a matter of sentiment than a matter of logic. Workers are not isolated, unrelated individuals; they are social animals and should be treated as such.

This statement—the worker is a social animal and should be treated as such—is simple, but the systematic and consistent practice of this point of view is not. If it were systematically practiced, it would revolutionize present-day personnel work (Roethlisberger, 1941).

As a result of the controversial nature of the research, the Western Electric studies produced a fair number of critics, both in the immediate aftermath and in the years following. At various times, Robert S. Lynd, Reinhard Bendix, Herbert Blumer, Clark Kerr, C. Wright Mills, Wilbert E. Moore, Harold Wilensky, and Daniel Bell have joined the debate questioning the design of the research or the interpretation of the findings.* Most of the major criticisms have centered around the pejorative connotation assigned to organizational conflict by the researchers and the disruption attributed to social groups within the Hawthorn plant. No allowance was made, contended the critics, for the dissension and inherent conflict that is naturally a part of the management–labor relationship. The goals and processes of “management [were] seen as rational while the worker [was] seen as nonrational” (Perrow, 1986, 83).

The human relations movement hardly revolutionized personnel work. It has, however, raised questions about orthodox management approaches and offered fresh ideas regarding new approaches. The movement has been less successful in offering empirical support for its basic contention, namely, that there is a direct relationship between social factors and productivity. Perrow contends that this may be due to an inherent shortcoming of social science methodology as applied to complex organizations:

The social sciences, at least in the area of complex organizations, have been desperate for ideas, not data. The practitioners seize upon concepts that will make sense of the world; if the concepts make sense, the social sciences do not inquire too carefully into the empirical support for these ideas or concepts. For those who find the idea as repugnant, the most pressing thing is to respond on ideological grounds; only later do some have the “luxury” of patiently reexamining the empirical documentation of the new idea (Perrow, 1986).

Despite this criticism, the human relations movement has contributed substantially to the knowledge and practice within the field of personnel administration. The research undertaken by the generations of psychologists, sociologists, and political scientists associated with the movement can be categorized into the areas discussed in the following two sections.

A. LEADERSHIP, MOTIVATION, AND PRODUCTIVITY

The relationship between leadership, motivation, and performance in work organizations has been the single largest research focus to emerge from the Western Electric studies. The presumption has

* For a comprehensive discussion of the criticisms of the Western Electric research, see Perrow (1979, 82–84).

generally been that “good” leadership will lead to greater motivation which will subsequently result in greater productivity (Perrow 1979). Despite uncertainty over the direction and strength of the linkage, a great deal of research has focused on this relationship during the past 60 years. Stogdill’s (1974) *Handbook of Leadership: A Survey of Theory and Research* provides the most exhaustive one-volume treatment of this research written to date.

In a survey essay reviewing leadership studies undertaken over this 60-year period, Schriesheim et al. (1978) categorized the leadership research into three phases: the trait phase (up to the late 1940s), the behavioral phase (late 1940s to early 1960s), and the situational phase (early 1960s to present). Regardless of the phase, they concluded that leadership could never be properly understood when studied apart from broader, more environmentally induced concerns.

Other studies, examining more directly the relationship between employee attitudes and performance, have examined a range of issues without producing remarkable conclusions. Brayfield and Crockett (1955) reviewed the results of approximately 50 such studies and found little evidence of this presumed relationship. In subsequent years, a number of the premiere names in organization theory and behavior, including Vroom (1964) and Lawler and Porter (1967), completed similar studies with only moderately conclusive results.* In the 1980s, Cavanagh (1984), Cummings (1984), and Milbourn (1980) examined the effect of compensation on worker motivation and performance. As a collection, this research has produced findings of limited applicability to organizations or management, although the phenomenon continues to be of interest to a few social scientists.

B. GROUPS, GROUP PROCESSES, AND ORGANIZATIONAL ENVIRONMENTS

This aspect of the human relations movement also focused on performance and productivity, but with more concern for the influences of groups, both formal and informal, and organizational environments than for the attitudes and approaches of individual leaders. Although the research in this area has been less prolific than research on leadership and productivity, it has on the whole produced more tangible benefits.

As with the leadership–motivation–productivity research, a number of luminaries in the behavioral sciences have contributed to an understanding of the issues surrounding group and climatic influences. Barnard (1938) pioneered the study of the informal group in his seminal book, *The Functions of the Executive*. Most importantly, Barnard identified its major effects as establishing “attitudes, understanding, customs, habits, (and) institutions” and creating “the conditions under which formal organizations may arise.”

Maslow (1943) examined various factors shaping human needs in an effort to rank those needs in order of relative importance. McGregor (1960) explored managerial attitudes in relationship to employee typologies and produced the contrasting concepts of “Theory X” and “Theory Y” management. Likert (1961, 1967) structured four types of organizational “systems” and posited the “values” that each would produce with regard to various aspects of the organizational environment. Emery and Trist (1965) also dealt with organizational environments in order to identify the varying types of “causal textures.”

The group and environmental research led to a much broader appreciation of the complexities of life with organizations. Moreover, it has called to question many of the simplistic assumptions underlying both the scientific management approach and the leadership–motivation–productivity work. Finally, and perhaps most importantly, the research has served to legitimize the use of empirical studies, with an array of methodological approaches, in studying administrative and organizational phenomena.

Beyond the two areas addressed above, the work of human relations theorists has focused on numerous other themes, such as organizational and individual conflict (Argyris 1957, 1964, 1970), the development of democratic bureaucracies (Bennis 1966; Waldo 1952, 1980), and the pursuit of

* See Perrow (1979, chap. 3, 98–112).

social equity through administration (Frederickson 1971, 1980), to name but a few. Harmon and Mayer (1986, 197–239) provide a comprehensive review and critique of the work of the later human relations theorists.

Over the decades, the human relations movement has produced a vocal collection of opponents and proponents alike. Human relations opponents have criticized its inconclusive and often contradictory research findings, the absence of an integrated body of theory, and the tendency of its disciples to accept too much on the basis of ideological belief. Perrow (1979, 137), in particular, has criticized the movement's tendency to counter "the extreme rationality of scientific management with a romantic rationality sometimes grounded in Freudian psychology."

The majority of scholars, however, are more likely to agree with the assessment of Hannon and Mayer (1986, 239) that while later human relations theorists "have raised far more questions than they have answered," the "theory of public organization has been greatly enriched as a result." Their efforts have certainly enhanced our understanding of work situations in complex organizations and inexorably altered many managerial philosophies. Just as importantly, the human relations movement has taught organizations to reject any and all truisms regarding human behavior.

C. THE QUALITY WORKPLACE MOVEMENT

Gradually, although consistently since 1985, total quality management (TQM) proponents have worked to challenge the administrative orthodoxy of government at all levels. It would be erroneous to characterize the quality movement as a logical extension of the human relations movement. Yet both movements are heavily value laden with a strong emphasis on goal-directed rather than process-directed behavior. Indeed, they advocate many of the same institutional values: participatory processes, decentralized decision-making, and flattened organizational structures (Osborne and Gaebler 1992).

In the rich and varied array of ideas progressing from Deming's work in post-World War II Japan to Brian Joiner's (1994) *Fourth Generation Management*, the quality movement has raised serious questions about the efficiency and effectiveness of the contemporary complex organization. Given that admonitions are delivered equally to the public and private sector and that a common model is advocated, the movement has great appeal for students of the generic organization.

Skepticism exists among those scholars and practitioners who regard government as serving a different, arguably higher end. Fundamental differences between entrepreneurial autonomy versus democratic accountability (Bellone and Goerl 1992) and service to the customer versus service to the broader public (Boyne et al. 1999; Swiss 1992) have been offered as basic incompatibilities. Indeed, the existence of a "public service ethos" (Pratchett and Wingfield 1996) might go far in explaining why predictions of a homogenized private–public personnel function have yet to materialize.

The private sector bias in the literature on administrative and managerial techniques has led some observers to wonder about the attendant neglect of public sector success stories. Ingraham speculates that cases of superlative work by government agencies often go unrecognized or unreported:

There are lessons to be learned from private-sector techniques and experience. There are also, however, lessons to be learned from excellent *public* organizations, and those lessons have been far more rare in the reform tradition. Organizations such as the Internal Revenue Service, many agencies in the Department of Defense, and the Forest Service have a long tradition of creative and farsighted management. Their experience with change and with the translation of other models of change to a public context can provide guidelines for other public organizations. ... How they did it and what they learned should be a part of the public-reform tradition (Ingraham 1995, 141).

Whatever the resolution, this debate promotes introspection and serious discourse on the nature and essence of public service. The quality movement should be credited in no small part for re-engendering such a debate at a time when public administration at all levels seeks to revalidate its societal worth.

IV. THE QUEST FOR REPRESENTATIVENESS

Few issues in public personnel during the past century have been as vehemently argued as the necessity for achieving a representative bureaucracy. Even the definition of what constitutes representativeness in public organizations has been open to debate. One of its earliest advocates, J. Donald Kingsley (1944), viewed the concept as a class issue, particularly within the context of the British Civil Service, the principal focus of his thesis. Kingsley generally contended that members of underrepresented groups should be vertically promoted to an elite status. Other scholars have argued stringently that the concept requires bureaucratic participation in direct proportion to the group's size in society (Kranz 1976). Still others have argued more moderately for simple equality of opportunity in entry and promotion. Krislov and Rosenbloom (1981) have advanced an even broader view of the representative bureaucracy that includes representation by personnel, representation by administration organization, and representation through citizen participation.

As a personnel issue, representativeness has been a vitally important, yet exceptionally sensitive, concern since the early 1940s. Of critical importance has been the necessity for preserving the merit idea while at the same time advocating preferential hiring. From a legal perspective, the role of public personnel administration in pursuing such representativeness has been problematic. Until 1972, the federal personnel system produced little beyond a series of well-intentioned, but largely symbolic, executive orders.

In 1972, the passages of the Equal Employment Opportunity Act (EEOA) reflected a determined, but tempered commitment to achieving broader representation in the public workforce. During this same period, the judiciary was active in championing the means, if not always the ends, of affirmative action. The decisions in court cases such as *Griggs vs. Duke Power Company*,* *Carter vs. Gallagher*,† and *LeFleur vs. Cleveland Board of Education*‡ served to restrict the use of discriminatory practices or processes, although frequently in the most circuitous manner.

How should scholars assess the effects of such change? Despite nearly unanimous appreciation for the approach taken by the EEOA and the courts, research on its effects has produced limited findings. Rose and Chia (1978), in examining black employment in the federal service during the period 1969–1974, concluded that “slow but steady progress” was being made, but they found the change occurring primarily at the bottom of the federal schedules. The problem continues in the 21st century. In 2003, an OPM official appeared before a congressional committee to warn of the difficulty in diversifying the SES due to the dearth of minorities in the GS 14 and 15 classifications which have traditionally served as the “feeder pools” for senior positions (U.S. House, Committee on Government Reform 2003).

Rogers (1984) has contended that the federal government did not realize more progress before 1978¶ largely as a result of the Office of Personnel Management's (OPM's) resistance to affirmative action. He reasoned that such resistance stemmed from a commitment to strict merit hiring and an

* US 861, 27 L. Ed. 2d 101, 91 5.Ct. 98 (1971).

† L. Ed. 2d 338, 92 S. Ct. 2045 (1971).

‡ US 632 (1974).

¶ The federal reorganization plan of 1978 transferred OPM's responsibility for affirmative action oversight to the Equal Employment Opportunity Commission (EEOC).

aversion to “special training programs” and “qualification exceptions for women and minorities” (Rogers 1984, 100). Beyond OPM’s resistance, Rogers (1984, 114–115) identified seven problems contributing to the obstruction of progress:

1. An ill-defined policy goal and no quantitative standard by which to measure progress
2. Passive monitoring and enforcement of nondiscrimination efforts
3. Varying commitments from federal agencies for the concept
4. Reluctant support from Presidents Nixon, Ford, and Reagan
5. Little coordination among the enforcement agencies
6. Wavering pressure from minorities to force compliance
7. A cost-benefit implementation ratio that favors noncompliance

In analyzing the percentages of black males and females employed in the total workforce between 1958 and 1977, Rodgers did find evidence of employment gains. Similarly, Rodgers’ analysis of the federal workforce during this same period revealed moderate gains in black employment. Unfortunately, the gains were so minimal and so compressed at the lower end of the schedules that, in Rodgers’ (1984, 103) view, it would “take decades for blacks to obtain parity in the top positions within the federal government.” Stewart’s (1976) analysis of women in top federal jobs reflected a similar trend.

In an interesting development, however, the move to downsize government agencies in the 1990s gave a substantial boost to the percentage of women and minorities in the federal work force. Lane et al. (2003) attribute the increase to “a concerted effort... to retain minorities and women through the use of buyouts and early retirements in lieu of reductions-in-force.” By the close of the twentieth century, white males accounted for a shrinking portion of government jobs. Most observers expect the trend toward diversification to continue well into the new century (Lewis and Frank 2002). But in a survey of public personnel administrators and academicians, Hays and Kearney (2001) discovered that the latter were less optimistic that the quest for representativeness would continue to enjoy broad political support.

At the state and local government level, researchers found that these governments were generally doing a good job at increasing the number of blacks in their workforces (Dometrius and Sigelman 1984; Elling 1983). Moreover, blacks at these governmental levels were receiving salaries more comparable to those of white males (Dometrius and Sigelman 1984).

The struggle between merit and affirmative action principles has been the subject of extensive discussion. Livingston (1979) argues that the concept of meritocracy is deceptively racist, for both ideological and social reasons:

This capacity for self-deception increases as a society moves closer to the requirements of meritocracy. As legally sanctioned inequalities of opportunity to demonstrate merit are eliminated, and as effort and luck play a diminished role in determining life chances, it becomes easier to image that privately enforced group justice is inconsequential. This group disadvantage rooted in racism can be made to appear as individual moral failure (Livingston 1979, 154).

A more pragmatic critique of merit is offered by Krislov and Rosenbloom (1981, 52–57). In considering a number of factors influencing merit hiring, including education, they caution that “in simple, real world situations, an open meritocratic system is not pure.” Frequently, merit systems reflect biases on the basis of other than ability:

Information available to high status persons on opportunities and how to use them, informal access to gatekeepers or persons who can influence gatekeepers, and the fiscal opportunities to take advantage of education opportunities are usually classbound factors (Krislov and Rosenbloom 1981, 55).

Certain scholars, however, have maintained a wariness toward affirmative action, at least as it applies to preferential hiring. O. Glenn Stahl, in equating such hiring to “quotaism,” has condemned its potential effect on public personnel systems:

The danger is not merely the direct damage to the quality of administrative performance; the danger is equally the bad image of the public service created—one that public jobs are by nature rewards, or worse still, welfare dispensations created for the purposes of providing incomes to the needy or the deserving. The moral fabric of the society is surely in less danger by resort to the ‘negative income tax,’ a guaranteed income tax, or any other such device than it is by a corrosion in the public mind of the prestige of government employment (Stahl 1976, 24–25).

Zashin (1981, 380) agreed that affirmative action brought about “important deviations from ostensibly meritocratic standards in the public service,” but he also contended that no one had demonstrated that its success came “at the cost of deteriorating the quality of federal personnel.”

Glazer (1977), in his polemic against affirmative action entitled *Affirmative Discrimination*, expressed similar reservations:

To say that no policies have worked would be a simple error; everything, or almost everything, ‘works’ to some extent or another. But we have been crushingly disappointed by all our policies.

Have goals and quotas helped? Perhaps. It was my argument in this book that they help those who do not need help and hardly reach those who do. I am not sure I am right. Complex econometric analyses come out with different stories. If we take as a measure the condition of the black lower class, certainly goals and quotas have been no marked success (Glazer 1978, xii–xiii).

Partisan clashes over affirmative action in recent decades have ensured that representativeness remains a prominent topic of scholarly concern and inquiry. Much of the discussion centers on what Medcalf and Dolbeare (1985) call the “equality–freedom dichotomy.” This position has been frequently represented in the work of Kristol. Kristol (1978, 179) contends that the liberal position on equality has the potential of destroying individual liberty—in his view, the highest value in a free society. Consequently, “‘social justice’ may require a people, whose preferences are corrupt (in that they prefer liberty to equality), to be coerced into equality.”

The Reagan administration accepted this logic as an operational assumption. In assessing the current meaning of equality in America, Verba and Orren (1985) summarize the Reagan approach:

The Reagan presidency, beginning in 1981, ushered the latest spell of anti-egalitarian fervor. Intellectuals—new and old conservatives alike—criticized the egalitarian thrust of previous decades. The Reagan administration tried to turn back the tide, with some success. The administration approached its task, in the tradition of American politics, by seeking to reduce the disparity between ideal and reality. The Reagan ideal, however, was found not in the egalitarian symbols of the Declaration of Independence but in the individualistic symbols of the marketplace (Verba and Orren 1985, 370).

Even more perplexing is the fact that the courts, the guardians of affirmative action in the 1970s, began to challenge many of affirmative action’s core assumptions in the late 1980s and 1990s. Beginning with *Richmond v. J. A. Croson** in 1989, the Supreme Court advocated the application of a “strict scrutiny” to all race-based actions by state and local governments. In 1995, the court further restricted such programs in the controversial *Adarand Constructors v. Peña*† decision.

* US 469 (1989).

† S.Ct. 2097 (1995).

Concurring in the majority, Justice Scalia summarized the strongest challenge to Title VII in 30 years:

In my view, government can never have a compelling interest in discriminating on the basis of race in order to make up for past racial discrimination in the opposite direction. Individuals who have been wronged by unlawful racial discrimination should be made whole; but under our Constitution, there can be no such thing as a creditor or debtor race.

More recent decisions, however, indicate that the court remains willing to support limited—narrowly tailored in the legal vernacular—affirmative-action initiatives. In 2003, the court upheld the University of Michigan’s Law School admissions policy in *Grutter v. Bollinger*.^{*} Writing for the majority, Justice O’Connor explained that race could be used as a plus factor in the context of a balanced, nonmechanical decision making process. Even so, the court’s 5–4 split in *Grutter* suggests that affirmative action will remain at the center of judicial controversy for some time to come.

The subject of comparable worth and a concern over gender-based pay inequities continue to generate heated discussion. Of major concern is the attempt to develop equitable compensatory schedules for jobs that require comparable skills and abilities. Opponents challenge the concept’s tendency to inflate artificially market values and later wage stability (Livernash 1980). Neuse’s (1982) assessment of the controversial topic is comprehensive and provides an understanding of the often acrimonious exchanges among those researching it.

Much of the debate surrounding pay inequities has centered on the use of an absolute or universal standard for evaluating jobs (Remick 1983; Thompkins 1987). Far less abstract in its implication is the realization that women in the public sector frequently face a “glass ceiling” in career advancement opportunities (Naff 1994). The relative dearth of women at the top levels of governmental service remains a recognizable problem (Cornwell and Kellough 1994), and efforts to remedy the problem are too often marked by “three steps forward and two steps backward” (Guy 1993).

The enduring nature of these questions serves as a useful reminder that the effort to promote, create, and sustain a diverse public workforce has taken on a life of its own in public personnel administration. It is also clear that the effort requires a substantial investment of time and energy on the part of agency officials. Lane et al. (2003) emphasize the difficulty of balancing personnel goals with other organizational imperatives:

A workforce that represents the polity it serves has been a consistent democratic value.... However, this diversity also can create blocks to energy that will have to be addressed as workforce diversity increases. Differences in outlook, approaches to work, and general behavior customs create potential conflicts that easily can divert energy. Energy can get blocked by frustration or be diverted to conflict among groups. At a minimum, differences persist among groups about how they believe they are treated in the system. Perceived inequity clearly undermines motivation to apply energy to agency purposes (Lane et al. 2003, 135).

The quest for representative bureaucracy continues in our society. Yet what seemed an exemplary, even heroic, pursuit three decades ago has now become the focal point for much divisiveness and even derision. One thing appears certain: the future administrators are likely to see even more controversy with this troubled issue.

V. THE GROWTH OF BILATERALISM IN THE PUBLIC SECTOR

The fourth great issue in public personnel administration and labor relations deals with the development of the labor relations process itself and the growth of bilateralism in the public sector.

* US 241 (2003).

The right of federal workers to bargain with management, a relatively new occurrence, dates back only to 1962. On January 17, 1962, President John F. Kennedy issued Executive Order 10988 and established the basis for federal employees to organize.

Executive Order 10988 was superseded in 1969 by Nixon's Executive Order 11491, which created the implementation and mediation framework for the federal collective bargaining process, thus "bringing it more into line with practices in the private sector of the economy" (Fox and Shelton 1972, 113). Executive Order 11491 also acknowledged the right of federal employees to join or not join unions, but it prohibited federal strikes.*

Lacking explicit federal guidance, state and local governments tended to follow the federal example, despite a climate of greater hostility, fear, and skepticism (Nigro and DeMarco 1980). The single regional exception to this growth trend occurred in the Southeast, where less collective bargaining legislation has been passed and public employees have viewed the prospect of union affiliation with more reluctance (Kearney 1982).

The public personnel system functioned as a crucible for much of this change, with academicians and practitioners alike attempting to appraise the effects. For the first few years, research attempted to identify the differences between public and private sector bargaining (Haber 1968; Immundo 1975; Shaw and Clark 1972), to assess the size of public union membership (Cohany and Dewey 1970; Stieber 1973), and to explore the nature of public unions (Marshall 1974; O'Neill 1970; Stieber 1973).

The effects of public unionization on the personnel system and the public interest were also considered during this early period. Witte (1967) examined the impact of bargaining on the democratic process, while a number of scholars considered the relationships between bargaining and the merit principle (Helburn and Bennett 1972; Lewin and Horton 1975; Stanley 1970), and between bargaining and the civil service system (Feigenbaum 1974).

Throughout the 1970s, the concept of public strikes was a topic of sustained interest. Numerous articles, chapters, and books were published dealing with the topic of strikes, including both pro and con perspectives. An exceptionally negative treatment of strikes was included in Wilson's (1974) *Unions: Who Needs Them?*, while Billings and Greenya's (1974) *Power to the Public Worker* was unabashedly supportive. More moderate and objective views on the topic were provided by Aaron (1972), Barrett and Lobel (1974), and Barton (1970).

Emerging patterns of impasse resolution in the public sector during this period generated interest in the techniques of fact-finding (Doherty 1976), mediation (Ross 1976), and arbitration (Bornstein 1978; Rehmus 1975). Despite the increased sophistication in impasse resolution processes, Wesley's (1976, 3) comprehensive survey of resolution techniques began with the reminder that resolution often requires the "use of human relations skills" along with a determined commitment to "keep trying." Impasse resolution research has recently turned into a consideration of the effectiveness or various styles at different levels of government (Kolb 1983; Rodgers 1986).

Fiscal austerity in governmental budgets in the late 1970s and the late 1980s stimulated inquiry into the economics of public collective bargaining. Efforts have been undertaken to assess the impact of unionization on public wages (Karper and Meckstroth 1976; Mitchell 1978), to determine the effects of taxpayers' revolts on public employment and unions (Kearney 1983), and to explore the implications of the New York City financial crisis on municipal unions in that city (Weitzman 1979). Similarly, substantial attention has been devoted to productivity bargaining in an attempt to ascertain its viability for public employees. The reviews have ranged from the very critical (Horton 1976) to the moderately supportive (Layden 1980).

Despite this research, public bilateralism has traditionally been depicted as an area of relative neglect within personnel administration. This is particularly true in comparison with the other issues presented in this essay. Hays and Reeves (1984, 344–345) attribute the inattention to the

*C.F.R. 516 (Supp. 1971).

isolation of labor relations staffs and their low status in the organization. They are no doubt correct, but such an assessment warrants qualification. When the collective bargaining process in a jurisdiction breaks down, as it invariably does, the labor relations staff acquires visibility quickly.

Quite possibly the greatest difficulty still thwarting the credibility of public unionization is its basic incompatibility with civil service merit systems (Douglas 1992). Unions, with a strong reliance on the rule of seniority remain incongruous with the merit principle's rule of ability or even affirmative action's rule of accessibility. In the crowded public personnel agenda of the twenty-first century, unions may realize increasing difficulty in cultivating and maintaining a viable audience. This suspicion is supported by survey research. A 1997 study revealed that most personnel directors of federal, state, and local government agencies see union influence waning in the early years of the twenty-first century (Hays and Kearney 2001).

The future of unions in the public sector has become even more uncertain in the wake of the September 2001 terrorist attacks. The centerpiece of the Bush administration's organizational response to the tragedy was the creation of a new cabinet-level Department of Homeland Security (DHS), an entity which absorbed 170,000 federal employees from twenty-two agencies that previously had been dispersed throughout the federal bureaucracy. The new department, third largest in the national structure, was designed to provide better functional integration of government activities designed to protect against terrorist threats.

Significantly, President Bush requested and received congressional authority to impose a distinct set of personnel rules for the DHS. These rules reflect a "decidedly business school approach" (Ryan 2003) and are intended, in the name of national security imperatives, to give the president and his cabinet officer greater managerial latitude over department employees. Leaders of public sector unions are concerned, and with good reason: under the new rules, the Secretary of DHS has substantial authority to alter civil service protections without the consent of bargaining unit representatives (Ryan 2003).

Does the recent example of President Bush and the DHS exaggerate the threat faced by unions? Hardly; indeed, the threat may well be exacerbated. While DHS is an extraordinary agency formed during extraordinary times, public sector collective bargaining is less notable for what it has accomplished over the past thirty-five years than for what it has failed to accomplish. If public unions are to survive, their platforms must be increasingly progressive and their strategies more conciliatory.

VI. THE RECOGNITION OF THE PROFESSIONAL PUBLIC ADMINISTRATOR

The last of the five issues may well be the least concrete, although it is the most decisive in determining the future of public organizations and the public service. The development of professional public administrators and their recognition by society is the desired end of virtually every task that a personnel manager undertakes. Unfortunately, until the past decade, the concept of professionalism has had little more than symbolic meaning. Paradoxically, attacks on the concept have been responsible for much of the attention it has received during this decade.

In Woodrow Wilson's view, the professional character of civil servants depended on their ability to balance a commitment to the principles of the civil service with a commitment to public interest and opinion:

The ideal for us is a civil service cultured and self-sufficient enough to act with sense and vigor, and yet so intimately connected with the popular thought, by means of elections and constant public counsel, as to find arbitrariness or class spirit quite out of the question (Wilson 1887).

Max Weber's approach to professionalism was considerably more technical, and included such requirements as training, a fixed salary, tenure, career mobility, and a system of certification (Gerth and Mills 1946). Unlike Wilson, however, Weber was skeptical over the lack of educated

public opinion, particularly in large cities in the United States where immigrant votes were “corralled.”

Over the years, concerns regarding professional status for public administrators have been voiced sporadically, usually coupled with initiatives for reforming the civil service system. Only since the late 1960s and early 1970s has the issue of professionalism focused more definitively on the individual administrator, rather than on the system of administration. Minnowbrook and the new public administration deserve some credit for this by raising concerns about individual bureaucratic responsibility.* The Vietnam War and Watergate should not be discounted as influencing factors, either. During the same time period, professional degree programs in public administration were proliferating as student interest in public service careers grew. The National Association of Schools for Public Administration and Affairs (NASPAA) began to develop as a forum for curricular debate, a role that would develop into accreditation review in the subsequent decades.

The passage of the Ethics in Government Act in 1978 raised public consciousness regarding the ethical obligations of the public service. Structurally the legislation created an Office of Government Crimes within the Department of Justice and an Office of Governmental Ethics within OPM. It also required the disclosure of financial information for high-level bureaucrats and placed restrictions on certain post-employment activities.

The Ethics in Government Act also kindled interest in the ethical and moral foundations of professionalism. In the past few years, scholars have examined the prospects and desirability of a code of ethics (Chandler 1983), explored the nature and limitations of moral responsibility for public officials (Thompson 1985), and assessed the ethical dimensions influencing bureaucratic action in a democratic society (Rohr 1978). In 1984, the National Council of the American Society of Public Administration approved a code of ethics for ASPA members. The code, revised once in 1994, remains the subject of considerable discussion, as ASPA members seek to produce a more streamlined document with which professionals can identify (Menzel 2002).

In addition to the interest in ethics, the theme of professionalism has been treated explicitly in professional journals since 1981. In the fall of 1981, Rabin (1981) edited a symposium entitled “Public Administration as a Profession” in the *Southern Review of Public Administration*. The articles focused on a wide range of topics emanating from the broader theme of professionalism, including semantic definitions of profession (Marutello 1981), the characteristics of a profession (Kline 1981), and professional association membership (Yeager 1981). In 1984, *Public Administration Review* devoted an issue to the publication of the Proceedings of the National Conference on Citizenship and Public Service held in April 1983. The section addressing citizenship and the professional public servant included a consideration of the paradox between democratic citizenship and personnel administration (McGregor 1984), a review of the status of bureaucrats as second-class citizens (Rohr 1984), and a discussion of the relationship between citizenship and public administration professionalism (Cooper 1984). Much of this journal’s literature has been preoccupied with defining professionalism and rationalizing public administration’s claim to professional status.

Much of the recent emphasis on professionalism within public administration has come about as a defensive reaction to the wave of bureaucracy bashing so prevalent in the last decade. It is not surprising, therefore, that public administration has countered such criticisms with contentions underscoring the field’s record of administrative excellence, such as those contained in Goodsell (1985) *The Case for Bureaucracy: A Public Administration Polemic*. Goodsell’s thesis is unabashedly supportive of the American bureaucracy and the role that bureaucrats have played in the development of American society, but he does caution that:

[T]he field of public administration must develop the intellectual self-confidence to extend more uninhibitedly its own body of knowledge about public bureaucracy. We need to move beyond forty years of

* See the essays contained in Marini (1971).

dubious sociology and the antigovernmental biases of market-oriented economists, expose sociologists, and the critical theorists. Bureaucracies should be studied honestly for what they are, rather than for what they are not (Goodsell 1985, 148).

Professionalism differs from the preceding four issues in two aspects. First, the call for professionalism is limitless. Presumably, as practitioners attain a heightened level of professional competency, or as a profession achieves a desired state of development, new standards are prescribed; the paradigm, of necessity, shifts. This is understandable within, but is frequently confusing outside, the profession. Second, professionalism is a terribly amorphous concept. Its meaning has varied with time, circumstance, and opportunity. In sum, the term as applied to the public service has lacked real definition and direction.

This uncertainty and the attendant skepticism have made public administrators easy targets as factional politics become more divisive. Yet, oddly, these are the times during which administrative competence is most sorely needed:

For politics only gives government its direction in a democratic order. It is commonly left to highly trained officials within the bureaucracy to provide the knowledge and skill that will enable government policy to arrive safely at its destination (Rourke 1992).

A more exacting standard, with barriers to entry, credentialization, and continuing certification is critically needed as this fledgling profession moves tentatively ahead.

VII. CONCLUSION

The enduring public personnel administration concepts presented in this chapter were chosen and argued based on reasonable and logical criteria. Still, the topics, by their very nature, promote controversy and argument. Conceptually, it is essential to understand that many of these concepts are interrelated to some degree, although distinctions, often arbitrary, have been made between each in order to facilitate their presentation.

The field of public administration has progressed substantially over the last one hundred years, driven in large part by the standards and expectations generated through its personnel function. After all, this was the century in which organizations were explored and defined and their personnel analyzed and categorized. While, certainly, the capabilities and limitations of the complex organization in contemporary society are now better understood, there is also enough information to make it clear how very little is known. The twenty-first century will likely see the emergence of new issues and new tensions, and will hopefully bring new wisdom. Still, the admonition of Alexander Hamilton in *Federalist* No. 68 remains timeless:

Though we cannot acquiesce in the political heresy of the poet who says—‘For forms of government let fools contest—That which is best administered is best’—Yet we may safely pronounce, that the true test of a good government is its aptitude and tendency to produce a good administration.

I. INTRODUCTION

All nations of any size and consequence must confront one of the fundamental problems of governance—how will the competing claims between central and peripheral authority be resolved? Constitutionally the issue is commonly framed in legal terms: Which jurisdiction has power(s) to do what, with what degree of discretion or autonomy? (Bulpitt 1983; Davis 1978; King 1982; Riker 1964; Rose 1982; Wheare 1964). Administratively the “basic theoretical question” was posed by Fesler: “How to relate area and function?” (also Fesler 1949, 1965, 1973; Truman 1940; Ylvisaker 1959). Much like the blending of politics and administration, the two questions overlap, are inter-related, and even merge (Macmahon 1972). The link between constitutional arrangements based on politics and organizational implementation centered on administration is a theme that permeates this chapter. It is hardly new. In fact, the constitutional–administrative theme has a not-so-hallowed tradition that spans the two centuries of American historical experience.

Our central aim in this essay is to offer a broad historical overview and alternative interpretations of the functioning of the American system of multi-level governance. We pursue this aim guided by a chronological motif that elaborates the three concepts specified in the essay’s title: Federalism, Intergovernmental Relations, and Intergovernmental Management. Each concept is traced successively from its origin and development, including its meaning and maturation. Several decades are specified and elaborated during which each concept gained currency, evolved in usage, and attained practical application. The span covered by the three concepts starts with the legal-historical features of the nation’s origins and the ambiguous status of administration at the founding of the Republic. It extends to the contemporary scene and includes major policy conflicts and tensions at the opening of the twenty-first century.

Several writers have noted the non-constitutional status of public administration in the mind-sets of the framers at the Philadelphia Convention (Carroll 1982; Heady 1987; Krislov and Rosenbloom 1981; Waldo 1980). Clauses in the Constitution that recognize the administrative function are nearly nonexistent. *The Federalist* does provide a few statements on administration. Despite their brevity and submerged status, the following passages from Hamilton, Madison, and Jay are instructive and pertinent to the purposes of this historical overview.

From Jay (No. 3):

when once an efficient national government is established the best men in the country will not only consent to serve, but also will generally be appointed to manage it; ... Hence it will result that the administration, the political counsels, and the judicial decisions of the national government will be more wise, systematical, and judicious than those of individual states, and consequently more satisfactory with respect to other nations as well as more safe with respect to us.

From Hamilton (No. 27):

Unless we presume at the same time that the powers of the general government will be worse administered than those of the State governments, there seems to be no room for the presumption of ill will, disaffection, or opposition in the people. I believe it may be laid down as a general rule that their confidence in and obedience to a government will commonly be proportioned to the goodness or badness of its administration. It must be admitted that there are exceptions to this rule; but these exceptions depend so entirely on accidental causes that they cannot be considered as having any relation to the intrinsic merits or demerits of a constitution. These can only be judged of by general principles and maxims.

From Madison (No. 46):

If ... the people should in future become more partial to the federal than to the State governments, the change can only result from such manifest and irresistible proofs of a better administration as will overcome all their antecedent propensities.

From Hamilton (No. 68):

... we may safely pronounce that the true test of a good government is its aptitude and tendency to produce a good administration.

From Hamilton (No. 72):

The administration of government, in its largest sense, comprehends all the operations of the body politic, whether legislative, executive, or judiciary; but in its most usual and perhaps most precise signification, it is limited to executive details, and falls peculiarly within the province of the executive department.

While modest in bulk, the ideas are large in importance. Hamilton (in 72) notes both the wide scope and detailed specificity of administration. He links good administration (in 68 and 27) to citizen confidence in and legitimacy according to government. Madison (in 46) also notes the link between good administration *and* citizen respect and loyalty; Jay (in 3) sees the national government attracting the best cadre of persons to manage and administer the new system.

Commentaries and analyses of the framers' views on constitutional federalism are legion (Beer 1993; Diamond 1961; Diamond 1976a, 1976b; Huntington 1959; Jillson 1981; Lienesch 1983a, 1983b; Warren 1968). Less extensive and probing are analyses of the framers' views on administration, although there are a few exceptions (Caldwell 1944; Rohr 1986; White 1948).

One hundred years after *The Federalist*, Woodrow Wilson closely scrutinized both administration and federalism in his well-known (1887) essay “The Study of Administration”. Four statements from the essay, two on administration and two on federalism, are noteworthy. Echoing Hamilton’s assertions, Wilson (1941, 497) noted that “the study of administration, philosophically viewed, is closely connected to the study of the proper distribution of constitutional authority.” Wilson also acknowledged that “it is getting to be harder to *run* a constitution than to frame one.” Although Wilson’s essay is often noted for creating the politics–administration dichotomy, a full and balanced reading of the essay makes it difficult to support the thesis that Wilson originated and endorsed a neat, simple, and sharp split between the two activities.

The extent to which Wilson discussed federalism in his classic essay is regularly overlooked (Wright 1987). Two passages quoted below are selected from several on the subject in the article. The first indicates Wilson’s awareness of the framers’ originality and of the constitutional–legal dimensions of federalism. In the second statement he expands on features of national–state–local relationships in language that could be used as a contemporary description of intergovernmental relations without appearing archaic:

What did we ever originate, except the action of the Federal government upon individuals and some of the functions of the Federal Supreme Court.

Our duty is, to supply the best possible life to a *federal* organization, to systems within systems: to make town, city, county, state, and federal governments live with a like strength and an equally assured healthfulness, keeping each unquestionably its own master and yet making all interdependent and co-operative, combining independence with mutual helpfulness. The task is great and important enough to attract *the best* minds.

We may debate whether Wilson was a founder or was influential in the development of public administration (Van Riper 1983; Waldo 1948). Regardless of the outcome of that debate, Wilson’s reflections and essay were part of the larger social, political, and intellectual ferment near the end of the nineteenth century. His thinking, writing, and action(s) were efforts to address and cope with a rapidly changing economic, social, and political–administrative order (Skowronek 1982).

Wilson’s (1887) essay and his statement about federalism 21 years later (Wilson 1908)—that it was the “cardinal question” of our constitutional system—reemphasized the basic issue of center–periphery authority one century after the system had been launched. About a half century after Wilson’s essay, Durham (1940, 6) explored the politics–administration link with a specific focus on intergovernmental relations (IGR):

So what of politics and administration in intergovernmental relations? Their interlocking indicates the unreality of checks, balances, and division into politics and administration. As a guide to a new theory of the division of powers, the idea of *administrative politics*, or the interrelations of public administrators in what appears to be increasingly more permanent offices with tenure, forms a more realistic concept . . . Questions of structure and function in the federal system preclude, under present boundaries and constitutional restrictions, the emergence of a more significant factor than the party in clearly defining the policy-phase of a new “administrative politics.”

Durham was unquestionably accurate in viewing IGR, conceptually and operationally, as an arena for the permanent blending or merging of politics and administration. His phrase “administrative politics” did not survive and blossom, but it did add impetus to the demise of the dichotomy that Appleby (1949), Long (1949, 1962), Sayre (1951), and others confirmed. Colbert (1983) suggested a politics-in-administration continuum as a reformulation and located more than a half dozen references to such a continuum. Regardless of subsequent developments, the significance of

Durham's critique of the dichotomy as it applied to federalism and IGR should not be underestimated. Waldo, for example, in *The Administrative State* (1948, 128) noted, "There is a close similarity between the rigid politics-administration viewpoint and that philosophy of federalism that pictured state and nation moving noiselessly and without friction each in its separate sphere."

While Durham was moving with the intellectual flow in attacking the politics-administration dichotomy, his analysis was not as prescient or predictive concerning two other variables he identified: political party and professionalism (permanent tenure). Durham (1940, 6) anticipated the "importance of the [political] party" as an instrument in producing "a decentralizing of ... power." In this respect he was a precursor of the more extensive development of the party-as-decentralizer thesis by the Advisory Commission on Intergovernmental Relations (ACIR) (ACIR 1986), Buchanan (1965), Grodzins (1960a), Riker (1964), and Truman (1955). The declines and shifts in party identification, party loyalty, and party efficacy have called into question the broad issue of the relationship, if any, of the party system to centralizing and decentralizing forces.

Durham's oblique reference to professionalism touched on another variable whose effect on federalism and IGR he could, at that juncture (late 1930s), only dimly perceive. The broader and generally centralizing impact of professionalism was not fully appreciated until years later by Beer (1978a), Grodzins (1966), Kaufman (1969), Mosher (1968), Mosher and Stillman (1978), and Wirt (1981).

We conclude this introductory 200-year sketch by drawing on Beer's presidential address to the American Political Science Association (Beer 1978a). His analysis of federalism and IGR was important for several reasons, only two which will be discussed here. The first highlights a political dimension and addresses Beer's idea of "representational federalism." Another element, addressed secondarily by Beer, involved administration and management, a domain from which the concept and practice of intergovernmental management (IGM) emerged.

By focusing on representational federalism, Beer put the final quietus, if one was needed, on the politics-administration dichotomy. He did this by arguing that wholly new forms of influence had evolved in the US political system and that federal arrangements accommodated them in ways consistent with its historic, flexible, and open-ended nature (Leach 1970, 1988).

The two emergent representational interests in Washington were, according to Beer, the "technocrats" and the "topocrats." The former represent the "new professionalism" in government—national, state, and local. They form the "professional bureaucratic complex" of functional program specialists; they are most easily understood as the vertical "pickets" forming the classic graphic of picket fence federalism (Sanford 1967; Wright 1974, 1988).

The topocratic interests revolve around what Beer (1976, 1977, 1978a) called the intergovernmental lobby. This cluster of self-designated public interest groups was composed of the associations of political-administrative generalists at the state and local level. Governors, state and local legislators, mayors, county executives, and city/county managers have mobilized on behalf of varied common concerns to make their presence and influence felt in the halls of Congress, the executive branch, and even the judiciary (Farkas 1971; Haider 1974; *National League of Cities v. Usery* 426 U.S. 833 1976; *Garcia v. San Antonio Metropolitan Transit Authority* 469 U.S. 546 1985; Arnold and Plant 1994).

Tensions and divisiveness between the technocrats and the topocrats were not new in the 1970s. They began to surface even as Durham wrote in the late 1930s (Clark 1938; Hovde 1940; Vieg 1940). Systematic investigation of the cleavages was pursued in the late 1940s by graduate students at the University of Minnesota under the direction of William Anderson (1960). In-depth attention to contrasting attitudes between the two groups was explored by Weidner (1955, 1960), and Ylvisaker (1956).

The normative issue surrounding the conflicts identified by Beer should not be overlooked. What has been the effect of these two new representational forms on other aspects of the democratic process? Have the technocrats and topocrats caused, as Beer (1978a, 20) feared,

“dilutions of the popular will?” Have they contributed further to fragmentation of representation and a reinforcement of the image that the nation’s capitol is dominated by “special interests?” Despite corporate instead of personal representation, Beer conceded that the two entities “do add real strengths to the modern state.” He wondered, however, whether “this may be at some cost to free government.”

Beer’s acknowledgment of the role(s) of technocrats (program professionals) constituted a secondary set of developments that originated in the 1970s. The operational significance and specialized domain of these administrators (later called policy professionals in the 1980s) were inadequately portrayed even in Beer’s perceptive analysis. Not until the 1980s would IGM be elaborated as a concept describing actions that sometimes complemented but often conflicted with federalism and IGR (Agranoff 1986; Peterson et al. 1986; Wright 1983, 1990a; Wright and Krane 1998).

This introductory section has touched lightly on a few critical junctures in the two-century evolution of center–periphery relations in the United States. On a chronological basis we have identified issues, ideas, and concepts surfacing at roughly 200, 100, 50, and 20 years ago. The remainder of this chapter relies on this chronological motif.

Three terms serve as the organizing concepts: federalism (FED), intergovernmental relations (IGR), and intergovernmental management (IGM). Our approach will follow the development sequence mentioned in the essay subtitle—the origins, emergence, and maturity of each concept, beginning with FED and concluding with IGM.

The temporal and developmental strategy adopted for the exposition of these three concepts can be presented in visual form. Figure 11.1 offers a timeline intended to reflect the historical patterns and the respective sub-periods for each concept. Federalism, which began with the founding of the republic, is often characterized as experiencing three broad eras—dual, cooperative, and coercive (Kincaid 1990b, 1993b, 1996). Over the past six decades IGR has been interpreted as passing

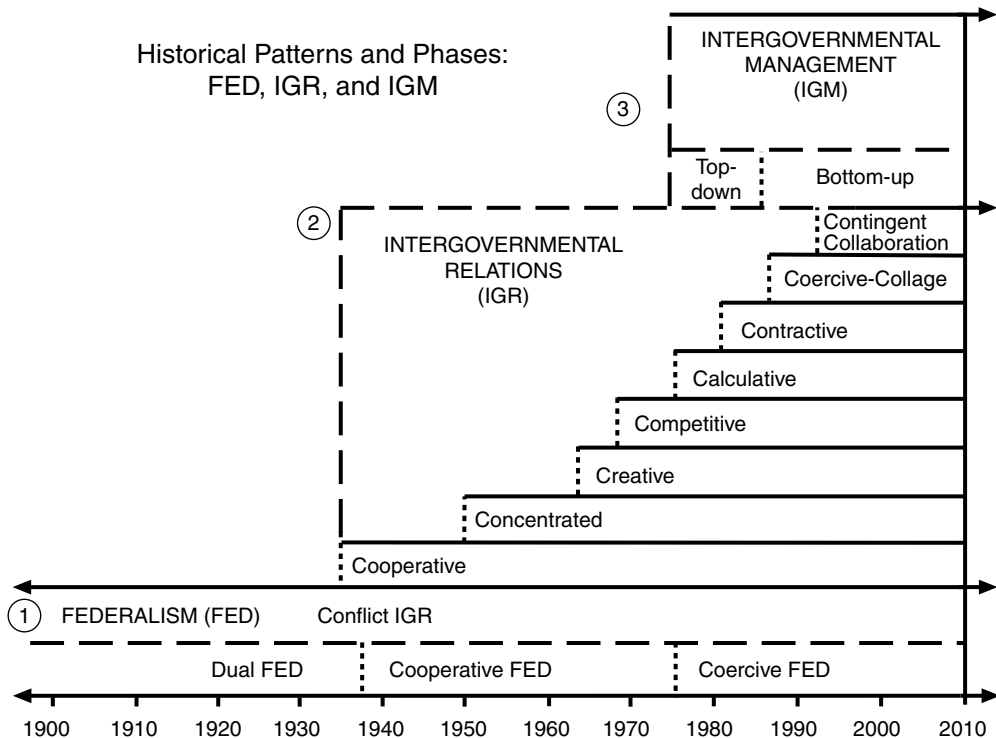

FIGURE 11.1 Historical patterns and phrases: federalism (FED), IGR, and IGM.

through multiple phases. These began with the conflict phase in the pre-1930s and continued to the coercive-collage phase of the 1990s and extended into the twenty-first century with the contingent collaboration phase (Wright 1988, 1997, 2003). Finally, IGM has been subdivided into two distinct periods. They reflect the top-down and bottom-up approaches to intergovernmental problem-solving practices encompassed by the concept (Wright and Krane 1998).

II. ORIGINS OF FEDERALISM

A. THE PHILADELPHIA CONVENTION

Without a doubt the Philadelphia Convention marks the starting point for an understanding of the origins of federalism and the meaning of the term today. The convention was called to “propose amendments and revisions” to the Articles of Confederation which had governed the former colonies since 1777. To the framers at Philadelphia the articles were “a federal system.” In other words, they did not make a distinction between federal and nonfederal arrangements.

Two statements make this clear. Madison writes in *Federalist* No. 39 about ways in which the new constitution incorporated both national and “federal” features. In the latter case he meant features from the Articles of Confederation. He concludes by saying that the new constitution is “neither wholly *national* nor wholly *federal*.” Elsewhere, George Mason wrote to his son shortly before the convention convened about the degree of agreement expected to prevail at the sessions (Jillson 1981, 600): “The most prevalent idea in the principal States seems to be a total alteration of the present federal system.”

Two points might be noted from these assertions. One is the political and strategic inventiveness of those supporters of the new Constitution. By calling themselves Federalists they laid claim to the least centralized system of links between central and peripheral governing entities. It also put their opponents, the *anti-Federalists*, in the awkward and defensive position of attacking modifications of existing federal arrangements (Storing 1981). The second point, drawn from Mason’s letter, is the widely shared set of basic political beliefs that were held in common by those who met in Philadelphia (Bailyn 1967; Benson 1960; Roche 1961; Wood 1969). A majority of the framers were clearly nationalists, although Holcombe (1950) and others have described and probed the various factions among those who agreed on the need for a stronger central government. Most analyses of the Philadelphia Convention dynamics highlight conflicts and crucial compromises. It is important, however, to be clear about two fundamental features that bound the framers together: (1) an underlying nationalism guiding “the first new nation” (Lipset 1963); and (2) a consensus on the need to strengthen the new central/national government (Holcombe 1950; Lienesch 1983b).

In spite of substantial agreement on fundamentals, the dominant mode of analysis of the convention is one that focuses on conflicts and compromises over the content, clauses, and structures of the draft Constitution (Farrand 1911, 1913; Holcombe 1950; Jillson 1981; Smith 1965; Warren 1968). Jillson (1981) applies factor analysis to convention votes at various phases and finds four issues that run through the alignments and realignments. Two of these, state integrity and the power scope of the national government, are federalism related. The broader implication of Jillson’s analysis is his effort to link convention constitution-making to theories of conflict and cleavage (Schattschneider 1960) and of critical realignment of the American party system (Burnham 1970; Key 1955; Sundquist 1973).

B. ADOPTION OF THE CONSTITUTION

The Federalist Papers are the undisputed starting point for understanding (1) the provisions of the Constitution, (2) the rationale of three framers (Hamilton, Madison, and Jay) for those provisions, and (3) the main arguments, pro and con, used during the adoption process. Seven different editions of *The Federalist* offer extended introductory essays that provide helpful orienting discussions

(Ball 2003; Carey and McClellan 2001; Earle 1937; Fairfield 1981; Kesler 1999; Rossiter 1961; Wootton 2003). *The Federalist Papers*, however, do not stand alone as the definitive corpus for constitutional understanding and interpretation, nor are they adequate for a firm grasp of the politics of the adoption process.

The negative side of the debate between the Federalists and the anti-Federalists has long been neglected, and only recently have the anti-Federalists reached a status where they “deserve to be considered founders as well” (Lienesch 1983a). The definitive work in this connection is traceable to the dedicated efforts of Storing (1981). In his exposition of what the anti-Federalists were for, Storing effectively challenged Kenyon’s (1955) thesis that the opponents of the Constitution were “men of little faith.” Lienesch (1983, 1988) added depth to the thesis with a careful and detailed analysis of the debates in the several state conventions called to consider adoption of the proposed constitution (Elliott 1861–1863). Ball (2003), in his edition of *The Federalist*, provides and cross-references fourteen “Brutus” anti-federalist essays to give readers “the greatest non-violent verbal battle ever waged in America” (xv) Cornell’s recent volume provides a full length treatment of the anti-federalist’s role “founders” (Cornell 1999).

C. FRAMERS’ INTENT, MEANING, AND ORIENTATION

There has been a revival of interest and debate over the framers’ meaning or intent concerning federalism as well as other parts of the Constitution. This can be traced in no small measure to Attorney General Edwin Meese’s (1985) stance favoring a “jurisprudence of original intention,” in contrast to what he saw as a “jurisprudence of idiosyncrasy.” Federalism, and particularly the doctrine of incorporation of the Bill of Rights as limits on the states (through the Fourteenth Amendment), is one of the issues at bar.

What was the framers’ original view(s) of federalism? How was federalism linked to the larger philosophical context and framework from which the framers developed their arguments? This chapter cannot answer those questions; it can only identify sources and views from which discussion and debate may proceed (Beer 1993).

The most serious, sustained, and critical appraisal of the framers’ views of federalism has been the work of Diamond (1961, 1969, 1971, 1976a, 1976b). His multiple and thorough explorations of the subject are done an injustice by any effort at a condensed summary. One theme, however, that pervaded his incisive analysis was the search for a clear and coherent set of constitutional principles. Diamond was undoubtedly one of the most persistent and rigorous examiners of the *principles* of the framers, confident in the fact that there were such principles and that it was imperative, for our own good, that we comprehend them.

William Anderson, no less of a scholar, was not sanguine about discerning the intention(s) of the framers. He devoted a full chapter to this subject in his thoughtful overview of *The Nation and the States: Rivals or Partners* (1955). Anderson adopted what might be termed an evolutionary view of the origin and meaning of the Constitution, saying that it “simply did not spring forth perfect, complete, and self-explanatory; most likely it never will be complete and perfect” (Anderson 1955). Anderson adds, with regard to the framers’ intent, “Indeed, it is merely vain imagining to assume that such a thing as ‘the intention’ of ‘its framers’ in the full sense ever existed or ever can be discovered” (Anderson 1955). More recently, Rakove (1990) provided an overview of issues involving original intent.

Beyond the “original intention” debate there is a broad and expanding body of recent critical or rethinking literature on the philosophical foundations of the framers from which federalism, however interpreted, sprang. Three full-length expositions offer formidable challenges: Dahl (1956), Wills (1981), and Elkins and McKittrick (1993). Dahl argues, in part, that Madison (primarily) misread his own time and was not fully consistent in the logic of his arguments, especially in *Federalist* no. 10. Wills, on the other hand, finds a single philosophical base penetrating all of *The Federalist*, even overriding the inconsistencies and differences between Hamilton and

Madison. Recall that when the Virginia Plan was drafted by Madison to take to Philadelphia, Hamilton urged that state governors be appointed and removed by the president; Madison tempered this by including a provision permitting the national Congress to veto any state law. Elkins and McKittrick (1993) probe deeply the entire age (decade) of the “founding generation” with a special emphasis on their “modes of thought and feeling.”

Wills argues that what pervaded *The Federalist* and bound it into a single whole was a non-Hobbesian view of human nature, one confident of the presence of public good and virtue among the citizenry. Thus, the fragmented structure of the government, including federalism, was not anti-democratic. Rather it was a way of filtering out through selection processes across large territory those people who would not put the public interest and common good first and foremost (see also Morgan 1981).

The contrast between Dahl and Wills can be usefully mediated by reading the essays of Ostrom (1971, 1987, 1991) and an article by Lienesch (1983b). Ostrom emphasizes the “compound” character of the republic and its consistency as a complex political theory involving federalism.* Lienesch contends that the meaning of the Constitution can be constructively interpreted if the framers are seen as relying on a blend of history, philosophy, and science. The science-based character of the framers was further elaborated by Ranney (1976).

One further point requires notation before completing this sketch of the founding of federalism. It can usefully be addressed in terms of the framers’ orientation toward change. Were the framers at Philadelphia reactionaries, reformists, or revolutionaries? Cases have been made for all three interpretations.

The classic exposition of the reactionary view was Beard’s (1913) *Economic Interpretation of the Constitution*. His view that Madison was the Marx of the ruling class has been broadly challenged (Brown 1956; Warren 1968). The influence of Beard’s interpretation persists despite his later recantation (Beard 1945).

A second view of the framers saw them as a reformist group of pragmatic politicians. Perhaps the leading exponent of this view was Roche (1961). There are, however, several others who would share this label and highlight federalism as one of the pragmatic reforms produced by the convention (Elkins and McKittrick 1961, 1993; Holcombe 1950; Jensen 1950; Ranney 1976; Smith 1965). This view of the framers as constructive change agents appears to dominate contemporary thinking.

Perhaps the least attention has been devoted to the framers as radicals or revolutionaries, a group that overthrew the old order. One of the few to address this issue was Earle (1937). Three revolutionary actions were taken by the framers, ones that violated the “rules of the game.” First, the convention at Philadelphia had exceeded its authority by writing a whole new constitution, not merely proposing revisions or amendments to the Articles of Confederation. Second, in securing adoption, the framers bypassed the state legislatures and called for the document to be considered by popularly elected special conventions. The third revolutionary element was that the Constitution took effect after adoption by 9 of the 13 state conventions. Earle observes that these unprecedented actions constituted “an act of revolution, a coup d’etat” (1937, ix). Lienesch (1983a, 65) puts the results in appropriate and ironic perspective concerning the anti-Federalists and the Federalists: “Perhaps it is only proper that history is unkind to losers. To the victors go the spoils, including a prominent place in the history books.”

While tangential to our central thesis, ratification of the Constitution by the specially-called state conventions merits passing comment. Two points are particularly relevant. One was the

* Ostrom (1987) later expanded his analysis of the framers’ premises concerning choices about the constitutional “rules of the game.” The framers’ premises, according to Ostrom, included an optimistic view of how constitutional arrangements could constrain selfish interests and encourage or promote actions favoring the common good. This optimism stood in sharp contrast to Hobbesian assumptions. One reviewer of Ostrom’s work (Yarbrough 1988, 299) concluded, however, that he (Ostrom) has “a far closer affinity with Hobbes than is in fact the case.”

emphasis on state sovereignty as a check on national power(s). A second was the crucial concession made by Constitutional advocates involving the need for a Bill of Rights (Lienesch 1983b, 1988). The first Congress submitted several amendments, ten of which were promptly adopted. Setting the agenda for future controversies that would escalate both sooner and later, the Tenth Amendment provided for "reserved powers" to remain the domain of state governments.

III. EMERGENT FEDERALISM 1790–1890

The phrase *emergent* is used to convey the idea of a period in which a young system grows, evolves, and achieves a well-developed or coherent identity. This stage or phase precedes the *mature* stage in which it reaches its broadest variety, complexity, and sophistication. The somewhat arbitrary time frame established for this emergent phase of federalism is from 1790 to 1890. We look at this span from four standpoints: (1) the nature of the Union and the legal order, (2) politics, (3) administration, and (4) resources.

A. NATURE OF THE UNION

In his 1981 inaugural address, President Ronald Reagan asserted: "The federal government did not create the states; the states created the federal government." His words were quickly challenged by historians and political scientists (Beer 1982, 1993). Their rejoinders were on the grounds of historical inaccuracy and/or interpretation. The point at issue of course was, what was or is the nature of the federal union put in place by the Constitution?

Was the Union a compact among states? Or did the Union rest directly on the consent of the people as the source of legitimate power(s) exercised by both the national and the state governments? The premise behind both these questions derives from the prevailing eighteenth-century social contract theory about the basis for exercising political and governmental authority. The issue was who were parties to the contract—the states or the whole people of the United States? Ardent advocates over two centuries of political and legal constitutional debate have leaned toward one or the other of these state-based compact or people-based nationalist assumptions.*

Leaders of the nationalist view ranged from Alexander Hamilton and Daniel Webster to Abraham Lincoln and both Theodore and Franklin Roosevelt. Lincoln, for example, in his first inaugural address (1861) declared that "the Union is older than any of the states, and in fact created them as states.... The Union gave each [state] whatever of independence and liberty it has." Lincoln's choice of words is significant. By Union he is not referring to the national or federal government (in Washington, DC). Rather his reference draws on the abstract idea of the United States of America, a term that transcends (yet includes) all the states as well as the national government.

The compact theorists also featured prominent historical personages—John C. Calhoun, Jefferson Davis, and (earlier) Richard Henry Lee, as well as other anti-Federalists opposing the adoption of the Philadelphia Convention product. The anti-Federalists recognized the major shortcomings of the Articles of Confederation but they could not concede the need for such a strong central or national government.

* There is an alternative to the either/or alternative presented by the nationalist versus compact theories regarding the nature of the union. This might be termed the "mixed" or the "matrix" model of the national-state relations. It has been a focus of attention for Ostrom (1971, 1987), but it has been elaborated most extensively by Elazar (1973, 1981, 1987, 1988). Ostrom and Elazar trace this model directly to Madison's writings, both within and beyond *The Federalist Papers*. They note that, among other things, this matrix model explains why Madison could be both a strong nationalist at the Philadelphia Convention in 1787 and yet 10 years later emerge as a compact advocate in the Kentucky resolutions.

At one time, 1798–1799, the compact advocates even included Thomas Jefferson and James Madison, who, respectively, drafted the Kentucky and Virginia resolutions. These strident state legislative actions were precipitated by the Alien and Sedition Acts passed by Congress in 1798. They used the words *nullification* and *interposition* to identify and justify broad but uncertain powers reserved to the states. The two sets of resolutions claimed that the states could use the powers to oppose (block or nullify) what they (individually or collectively) thought were unconstitutional actions by the national government. The resolutions also laid claim to the right of secession. A nullifying state could leave the union if it disagreed with the will of a majority of states regarding a particular national action.

How has this conflict over the nature of the Union been resolved? It has been settled in practical and probably unalterable terms in favor of the nationalist view, President Reagan to the contrary notwithstanding. The means of settlement have been multiple and varied. The Civil War was one manner of settlement—by violence. Constitutional amendment, especially the Fourteenth Amendment, was a second means. Judicial interpretation has been a particularly prominent third means. Indeed, Chief Justice Chase’s view in *Texas v. White* 7 Wall 700 (1869) is perhaps the classic court assertion. The case hinged on the question of whether the State of Texas had actually left the Union when it seceded in 1861:

When, therefore, Texas became one of the United States, she entered into an indissoluble relation.... The act which consummated her admission into the Union was something more than a compact; it was the incorporation of a new member into the political body. And it was final. The union between Texas and the other States was as complete, as perpetual, and as indissoluble as the union between the original States. The Constitution, in all its provisions, looks to an indestructible Union, composed of indestructible States.

Note that the “Union” here, as in Lincoln’s comments, is not the national government. Indeed, the terms used for the governmental entity in Washington, DC, during the first century reflected, for the most part, the multiple descriptors used originally in *The Federalist Papers* written in 1787–1788. These included general government, central government, national government, US government, and federal government. Recall also that during the Civil War the forces of the North were referred to as the Union Army and the soldiers were called Federals.

From a legal, historical, and conceptual standpoint we can treat the nature of the Union as being settled in favor of the nationalist interpretation. To assert, this, however, does not imply that all legal and jurisdictional questions of national–state relations are stable or settled. There is an enormous body of writing and corpus of case law that addresses the past, present, and prospective dimensions of these formal power controversies.

Beyond the abstract question of the nature of the Union, there was a set of economic development forces and efforts that led to an intimate intertwining of federalism, state legal doctrines, economic growth, and federal and state judiciaries. The interplay of these themes is reviewed insightfully and comprehensively by Scheiber (1976, 1978). He refers to the period from 1789 to 1861 as “dual federalism and rivalistic state mercantilism.” Scheiber (1976, 71) notes that “precisely because significant policy fields were occupied largely by the states (whether or not all of the policies pursued were consistent with Supreme Court dicta), and because state area jurisdictions were congruent with the functions undertaken, American federalism before 1861 was decentralized.”

Scheiber (1978, 636) classifies the period from the Civil War to 1890 as “transitional federalism.” Despite three constitutional amendments (Thirteenth, Fourteenth, and Fifteenth), court decisions, economic changes (industrialism), and so forth, there is strong evidence in support of the thesis that “in sum, there was remarkably little shift toward the center in real power” (Scheiber 1978, 637).

B. POLITICS

If there was little consequential legal shift in real power toward the center during the nineteenth century, there were some significant political alternatives that added to the stature of emergent federalism. Only one institutional change will be discussed, one that set the stage for subsequent maturation.

The US Senate was originally and generally viewed as a “peripheralizing institution” (Riker 1955, 455). It was expected to be a direct vehicle for the expression and protection of state interests (Riker 1955). Recall, of course, that unless some states chose otherwise, and until the Seventeenth Amendment in 1913 mandated popular election, US senators were selected by votes in each state legislature.

Riker (1955) traces the unsuccessful effort of state legislatures to instruct senators on crucial votes. The “right of instruction” was even proposed for inclusion in the First Amendment but failed to secure House passage. Thus began the demise of the Senate as an instrument of *state* representation. The story is more complex and involved than this brief summary conveys, but the primary point holds. The Senate began as a low-status, “localist” entity. (From 1790 to 1849 a total of 48 US senators actually resigned to accept state offices). It became, during the nineteenth century, a more potent and even powerful body (Wilson 1885). Its power was significantly enhanced when the spoils system became more extensive (and venal) later in the century and when senators, because of patronage, often became informal heads of their state party organizations.

C. ADMINISTRATION AND RESOURCES

In his magnum opus on intergovernmental relations, Graves (1964, 478) notes, “At the risk of oversimplification, one may say that there were four major problems in nineteenth-century America—disposition of the public domain, internal improvements, education, and slavery.” The last of these was addressed by the courts and, ultimately, on the battlefield. The other three were addressed first in the Congress by legislation and finally in their implementation by administrative operations.

The definitive history of administration during the emergent phase of federalism is the four-volume work of L. D. White beginning with *The Federalists* and ending with *The Republican Era* (1948, 1951, 1954, 1958). White’s focus was not primarily federalism oriented but relevant insights are strewn throughout the books. Elsewhere he developed more fully his thesis about the century-long “administrative settlement” between the national and state governments (White 1953, 6–12). White (1953, 8) described the arrangement as follows: “A dual system of government and administration emerged, each level independent in its own sphere and operating without hindrance from the other, each supported by revenues of which it held full command.” He added that “the states and particularly the cities became busy workshops of the administrative world, while the general government performed few functions that had not been commenced in the days of the Federalists” (White 1953, 10).

White’s administrative “settlement” or dualism was probably accurate so far as the absence of hindrances was concerned. But the dualism thesis had modest or limited applicability in the realm of advice, technical assistance, and resources. Elazar’s (1962) work on nineteenth century cooperative federalism amply documented the support provided to state operations by national officials in such areas as internal improvements, agriculture, banking, elementary education, forestry, higher education, state militia, and social services.

Elazar’s thesis was sweeping, namely, “that virtually all the activities of government in the nineteenth century United States were cooperative endeavors, shared by federal and state agencies in much the same manner as government programs are shared in the twentieth century” (1962, 1). Stated this broadly, it invited challenges. Scheiber’s (1966, 1980) rejoinders are probably the most significant. The issue(s) centered on the scope and significance of the administrative cooperation in the context of constitutional, legal, political, and battlefield conflict(s). The controversies over

states' rights and the compact theory of the union were not moderated or obliterated by the extensive amount of cooperation confirmed by Elazar (1962).*

In the resource field, Elazar (1962) and Graves (1964) offer solid and original analyses of the way in which the national government used its major resource—the public domain—to promote its purposes. From 1787 in the Northwest Ordinance, through the Morrill Acts (1862 and 1890) to the 1887 Hatch Act on agricultural research stations, the national government used resources to promote education in particular and internal improvements generally. Graves (1964, 510) lists 18 pieces of legislation that constituted federal aid to education from 1785 to 1890. Public land, of course, was the chief resource of the national government. Over 1 million acres in land grants were made during this period, with about 30% claimed by homesteading, 20% set aside for schools, and around 10% for railroad construction (Graves 1964, 481).

As the end of the nineteenth century approached, federalism in the United States had fully and clearly emerged. It had reached what some theorists of economic development might term a takeoff stage. We choose to call it the beginning of the mature stage.

IV. MATURE FEDERALISM 1890–1940

The half-century period from 1890 to 1940 marked the nation's movement, both domestically and internationally, toward maturity in several domains. The maturation of federalism was an important part of overall domestic development. Changes occurred in the arenas of constitutional law, political realignments, administrative growth, and fiscal innovations. Each of these four arenas will be reviewed briefly.

A. CONSTITUTIONAL LAW

The nature of constitutional interpretation during the five decades prior to 1940 has commonly been referred to as the heyday of “dual federalism” (Corwin 1950). Corwin's thesis was that for much of this period the Supreme Court operated as a super-legislature, sitting in judgment to second-guess the actions of both the national and the various state legislatures. The extremity of judicial activism was so unprecedented, in Corwin's view, that it constituted “Court over Constitution” (Corwin 1938).

The mechanisms of judicial judgment were chiefly twofold: (1) the due process clause of the Fourteenth Amendment and (2) the reserved powers doctrine of the Tenth Amendment. The former provision became a vehicle for Court review of numerous state laws involving economic and social legislation, for example, labor unions, employment, and so forth. In interpreting due process the Court exercised *substantive* judgment about the wisdom and desirability of numerous state actions.

From 1890 to 1940, the Supreme Court considered 2316 cases dealing with federalism that involved the exercise of state authority (Sprague 1968, 62). It is also pertinent to note that during this 50-year period only 21% of the Court opinions on federalism cases were divided. From 1940 to 1960, over 50% of the federalism cases were split decisions (Sprague 1968, 62). The former low percentage suggests a high degree of agreement about the nature of national–state relations characteristic of an advanced stage of development.

The basic posture of the Court was set during the initial part of this half-century under the leadership of Chief Justice Fuller (1888–1910). Of this period Schmidhauser (1958, 139) noted that “two fundamentally important revolutions in federal-state relations can be in large part credited to the Fuller Court. By utilizing doctrines such as reasonableness and liberty of contract, the Fuller Court made the due process clause of the Fourteenth Amendment the lever for a hitherto unprecedented expansion of federal judiciary supervisory power over the legislation and action of the states.” Another and somewhat lesser lever for the Court's accomplishing the same end was the use

* In fairness to Elazar, however, it should be noted that he did not assert that the extensive collaboration he documented either eliminated or reduced to insignificance many aspects of state-national conflict in the nineteenth century.

of the national commerce power as a limit on state action. At the same time the Court beat a hasty and significant retreat on potentially broad interpretations of different Fourteenth Amendment provisions as limitations on the states, for example, the equal protection and privileges and immunities clauses.

It was the expansion of national power through the commerce and taxation powers that marked the “second great revolution” introduced by the Fuller Court. Here, Schmidhauser (1958, 140) concludes, “So far as the federal system is concerned, the Fuller Court wrought a far greater modification of the federal system in the direction of centralization than had any of its predecessors.” The Court, it appears, was launched on the way to confirming the maturity of federalism by giving wide latitude for selective national actions and imposing a more limited, restricted role for the states. Viewed from the standpoint of jurisprudence, judicial activism on federalism and other issues was more than merely launched, it was fully commissioned.

There was, however, a diversion or detour on the Court’s road to nearly unrestricted approval of national action. This happened when the national government attempted, through the commerce and taxation powers, to regulate such matters as child labor, agriculture, coal mining, and labor–management relations. From 1917 to 1937, in a series of cases, the Supreme Court held unconstitutional *national* legislation on the grounds that it invaded the reserved powers of the states to regulate manufacturing, mining, and so forth. For a brief time, particularly in the 1930s, it appeared that Court doctrines involving the Tenth and Fourteenth Amendments had created a no-man’s land where neither the national nor the state governments could effectively regulate some areas of economic and social endeavors. This issue reached its climax in the mid-1930s with the Court’s rejection of several major pieces of New Deal legislation.

Starting in 1937, the Court beat a timely retreat, upholding several important statutes involving social security, labor–management relations, and agriculture. The Court’s about-face was humorously noted as “the switch in time that saved nine.” After this “peaceful revolution” (Schmidhauser 1958, 182) the Tenth Amendment was “but a truism” that no longer operated as a direct restriction on national actions. Schmidhauser concisely summarizes below the legal status of mature federalism at the end of the 1930s:

After 1937, the doctrine of dual federalism was decisively rejected in the *Darby* case. The formalistic distinction between “direct” and “indirect” effect in commerce clause questions was, in effect, rejected in the *Jones-Laughlin* case. Federal taxing and spending power was construed broadly in the Social Security cases. The net effect of these broad constructionist decisions was a tremendous expansion of federal police power. Many subjects, such as certain aspects of labor relations, which had heretofore been considered well within the reserved powers of the states now fell under the congressional commerce power. The Supreme Court after nearly half a century of “selective” uncertainty viewed the economy of the nation for most purposes as unified one (Schmidhauser 1958, 182).

Corwin reflected on the changes wrought by the court and offered a more sweeping set of judgments:

... what was once vaunted as Constitution of Rights, both state and private, has been replaced by a Constitution of Powers. More specifically, the Federal system has shifted based in the direction of a consolidated national power, while within the National government itself an increased flow of power in the direction of the President has ensued (Corwin 1950, 2).

B. POLITICS AND PARTY REALIGNMENT

American politics from 1890 to 1940 were marked by two features that bore a significant relationship to a mature federalism. The first was presidential leadership of the type noted at the end of the preceding quotation from Corwin. The second was the prominence

(even dominance) of political party patterns structured by two “critical elections” (Key 1955) occurring in this period.

The “rise of the presidency” is one of the distinctive aspects of institutional change in American politics in the twentieth century (Corwin 1957; Leuchtenburg 1983). The firm foundations of presidential leadership were laid in three presidencies during the first four decades of the century. Theodore Roosevelt, Woodrow Wilson, and Franklin Roosevelt brought energy, vitality, and initiative to a national government that would, in various and subtle ways, confirm the preeminence of national issues over sectional and local ones.

All three offered national programs whose aims and mandates were solidified and sold as new. They were T. Roosevelt’s New Nationalism (Leuchtenburg 1961), Wilson’s New Freedom (Morison and Commager 1950), and FDR’s New Deal (Schlesinger 1959, 1960). The particular content(s) of the three programs varied, of course, in response to the perceived needs of the time. Their common theme, however, was the importance of action by the *national* government on a wide range of domestic problems. In slightly different terms, American politics from 1890 to 1940 had two bookends. At one end was the Progressive movement; at the one and other end was the New Deal. Both represented political surges that coalesced around issues that were perceived as national in scope and required national-level responses. These responses, however, tended to focus on and were filtered through national–state interactions. The state-level base and general structure of the party system ensured a high degree of national-level sensitivity to state-grounded interests and concerns.

Two specific examples will lend concreteness to this otherwise abstract set of assertions. On May 13, 1908, more than 40 governors met in Washington, DC, at the invitation of President T. Roosevelt (Brooks 1961). Although many national officials and public notables were present, “the governors were clearly the center of attention, and the proceedings were designated as a conference of governors without reference to the other participants” (Brooks 1961, 11). After this first conference the governors continued to meet on their own initiative and subsequently became known as the National Governors’ Conference (now the National Governors’ Association). The impetus for the initial meeting, however, was presidential, and it was convened to build visibility and popular support for TR’s *national* conservation policies.

The second illustration is drawn from the New Deal period and was described by Samuel Beer, himself a participant in the process he observed: “Roosevelt’s nationalism was a doctrine of federal centralization, and under his administration, in peace as well as in war, the balance of the American federal system swung sharply toward Washington” (Beer 1978b, 7). Beer reflects on his own role in contributing to the maturation of federalism by recounting his experience as a staff assistant to principals in FDR’s “Brain Trust”: “I vividly recall our preoccupation with persuading people to look to Washington for the solution of problems and our sense of what a great change in public attitude this involved” (Beer 1978b, 8).

Before this section on the politics of a mature federalism is concluded, more than incidental note should be taken of the party and partisan character of this half-century. Its politics were anchored by two critical or realigning elections (Burnham 1970; Key 1955). These anchors, dropped in 1896–1900 and 1928–1932, were ones around which a semblance if not a coherence in “public philosophy” emerged (Beer 1978b). While governed by a dominant Republican party coalition largely from 1896 to 1930, the politics of this era included strong strains of progressivism, reform, and humanitarianism (Morison and Commager 1950). Among the many challenges faced by American democracy in this period, two involved federalism. One was the rise of the city and the attendant demands for new types of political and social (as well as technical) engineering. The second was repairing the breakdowns in honesty and efficiency in the administrative systems of the country—national, state, and local (Morison and Commager 1950). These themes are addressed directly or indirectly in the following sections. They have already been referred to, at least obliquely, in Wilson’s (1887) essay where he called for trained and efficient public servants

who would help put an end to “the poisonous atmosphere of city government and the crooked secrets of state administration” (Wilson 1941, 485).

C. ADMINISTRATION

L. D. White settled on 1887, the year of Wilson’s essay, as the date when the administrative dualism between the national government and the states was breached, claiming that “the original *administrative* settlement existed without substantial alteration until 1887, the date of the passage of the Interstate Commerce Act” (White 1953, 10). This act was neither the singular nor the most significant administrative element in the transition from an emergent to a mature federal arrangement. White later notes, “The breakdown of the original pattern of independent administrative dualism was completed by the growth of the system of conditional grants-in-aid to the states and their subdivisions” (1953, 16).

The year 1887 seemed to be a vintage one for administrative transformation. Besides Wilson’s essay and the Interstate Commerce Act, the first annual cash grants to the states were authorized in this year. The Hatch Act of 1887, a prototype for modern grants, created the agricultural experiment stations—entities that quickly became associated with state colleges of agriculture (ACIR 1978a, 15; MacDonald 1928; Walker and Plant 1984).

It would be wrong, however, to think of 1887, or any other single year as the precise date for the transition from an emergent to a mature phase of federalism. This is true whether the shift is administrative, fiscal, political, or constitutional. The movement from one era to another occurred gradually but perceptibly. In few other instances is this progressive transition so well illustrated as in the administrative arena. Documentation on this point comes from a probing review of administrative maturation in the national government by Skowronek (1982).

Skowronek approaches his historical analysis from the theoretical standpoint of state building, where *state* is the generic term for the capacity to govern. His specific time focus is 1877 (the end of Reconstruction) to 1920 (demobilization after World War I). This four-decade period roughly fits the maturation phase of federalism.

The three specific foci of Skowronek’s detailed examination are (1) reform of civil administration (civil service reform starting in the 1880s), (2) reorganization of the army (shortly after 1900), and (3) establishment of national railroad regulation (starting in 1887). As he notes, “Taken together, [these three] mark the pivotal turn away from a state organization that presumed the absence of extensive institutional controls at the national level toward a state organized around national administrative capacities” (Skowronek 1982, 4).

The scope and content of Skowronek’s analysis are significant at multiple levels, with federalism representing only one element for which his findings have important implications. The general sweep of his approach and a flavor of his findings can be gleaned from two paragraphs:

Generally speaking, the expansion of national administrative capacities in America around the turn of the century was a response to industrialism. The construction of a central bureaucratic apparatus was championed as the best way to maintain order during this period of upheaval in economic, social, and international affairs. Viewed at this level, the American experience fits a general pattern of institutional development and rationalization in public administration. Indeed, specific and contemporaneous parallels can be found throughout the rapidly industrializing Western states for each of the administrative innovations to be examined here.

At a deeper level, however, our administrative response to industrialism stands apart and deserves special attention. In America, the modernization of national administrative controls did not entail making the established state more efficient; it entailed building a qualitatively different kind of state. The path that had been traveled in the development of early American government did not anticipate the need for a strong national administrative arm. To embrace the cosmopolitan bureaucratic remedy in meeting new demands on government, America had to alter course and shed already well-articulated

governing arrangements. The expansion of national administrative capacities in the age of industrialism became contingent on undermining the established structure of political and institutional power and on simultaneously forging an entirely new framework for governmental operations. The state that now supports so prominent a central bureaucracy is the product of this precarious politics of negotiating an internal governmental reconstruction (Skowronek 1982, 4).

A thoughtful reading of Skowronek's short introductory chapter and epilogue offers a tour de force for capturing the import of *national* governance capacities. The thesis advanced and confirmed by his study also sets the context for understanding better the nature of fiscal changes that were instrumental in fostering a mature federalism.

D. FINANCIAL RESOURCES

Several fiscal themes were prominent and persistent during the five decades following 1890. Among these were the following: (1) national resources to finance federal aid, (2) authorization and funding levels of grant-in-aid programs, (3) legal status of grants, (4) administration and implementation of grants, and (5) direct aid to cities (bypassing the states). Each theme is described briefly with references indicating opportunities for more detailed description and discussion of major issues.

1. Funds for Financing Federal Aid

During the nineteenth century, the prime resource of the national government was, as indicated earlier, public land. By 1890, a noted historian, Frederick Jackson Turner, and the Superintendent of the Census both announced "that there can hardly be said to be a frontier line" (Morison and Commager 1950, 99). The seemingly inexhaustible revenue resource from land sales was rapidly disappearing. For a variety of revenue reasons, the Congress passed an income tax levy (as part of a tariff measure) in 1894. This tax (of 2% on personal income over \$4000) was promptly declared unconstitutional in *Pollock v. Farmers Loan and Trust* 158 US 601 (1895).

It took until 1913 and the approval of the Sixteenth Amendment to overcome this Supreme Court decision. With its adoption the gate was opened for national government access to a major new revenue source. This source was so significant that by 1922 over 60% of all federal receipts came from the income tax (ACIR 1978a, 17). This growing and productive revenue base made it possible for the national government to look for new uses for the revenues. Among the many claimants were interests sponsoring new grant-in-aid programs.

2. Growth in and Funding of Grant Programs

Starting in 1914 and continuing sporadically to 1930 a small number of grant-in-aid programs were created and funded. These few (10–12) programs covered such purposes as agricultural extension (1914), highway construction (1916), vocational education (1917), vocational rehabilitation (1920), maternal and child health (1921), and forestry (1924). Five informative discussions are available on the growing variety and sophistication of grants during this period (ACIR 1978a; Council of State Governments 1949; Key 1937; MacDonald 1928; Report 1928).

Writing shortly before the 1932 presidential election, MacDonald updated his 1928 study of federal aid and reported that the level of funding for the "subsidy system" had remained relatively stable (MacDonald 1931). The figures were (in millions) 1922: \$118; 1927: \$123; 1930: \$135. He anticipated, however, that the aid figure would exceed \$200 million in 1932 in response to depression-prompted demands. MacDonald was prescient in other ways:

In various ways, therefore, the grants from the federal treasury to the states are establishing more firmly their claim to a permanent place in the scheme of American administration. Every year they receive the

support of additional precedents. They are rapidly becoming a habit. Still more important, they are producing results (MacDonald 1931, 634).

Not only did federal aid surpass \$200 million in 1932, it moved on a sharp upward curve before declining during the remainder of the Depression-dominated 1930s. ACIR's (1978a, 19) figures and MacDonald's (1940, 489) review of the 1930s disclose the following pattern of outlays (in millions):

1931:	\$180	1936:	\$1015
1932:	\$214	1937:	\$818
1933:	\$190	1938:	\$790
1934:	\$1803	1939:	\$583
1935:	\$2197		

The number of grant programs precipitated by the domestic economic emergency had risen to 21 in comparison to the few programs authorized and sometimes funded prior to 1930.

3. Legal Status of Grants

Two constitutional issues of major significance involving federal aid were resolved in this maturation period, specifically in 1923 and 1936. Two sources (Council of State Governments 1949; Wright 1968) address the issues raised in Supreme Court decisions rendered in those two years. In 1923, the Court made it difficult, if not impossible, for a taxpayer or a state government to gain legal standing and sustain a suit aimed at blocking the expenditure of funds for a grant program (*Frothingham v. Mellon* 262 US 447; *Massachusetts v. Mellon* 262 US 447).

In 1936, the Supreme Court finally confronted directly a long-standing controversy over the scope of the spending power implied in the "general welfare" clause of the Constitution (*US v. Butler* 297 US 1). Three brief discussions of this case and the spending power can be consulted (*Constitution of the US: Analysis and Interpretation* 1973, 136–140; Council of State Governments 1949, 17–20; Wright 1968, 19–25). There are, of course, extensive analyses of the clause and attendant issues in legal periodicals.

The basic fiscal issue at bar in *US v. Butler* was whether the Hamiltonian or Madisonian view of the spending power would prevail. Hamilton held that the Congress, under the first clause in Article I, Section 8, could spend money for any "general welfare" purpose. Madison took a strict constructionist approach, arguing that the taxing and spending power could be used only to foster the aims of other powers specifically granted to the national government. Following this principle, Madison opposed significant internal-improvements legislation on the grounds that the activities (e.g., roads, canals) were not enumerated as constitutional purposes of the national government. To shorten a long and somewhat complicated story, the Supreme Court in 1936 explicitly endorsed Hamilton's expansive view of the taxing/spending power. Sky (2003) provides a book-length exposition and interpretation of the long and complex history of the "general welfare" clause and spending power.

4. Administration of Grants

Two works offer sustained attention to the administration of grant programs. MacDonald's (1928) work reveals the progressive elaboration of review, approval, auditing, and other administrative components of the few early cash grant programs. He also explored aspects of grant impacts on state officials and intended recipients. MacDonald was active on a Committee on Federal Aid to the States sponsored by the National Municipal League. The committee conducted a questionnaire survey of state grant program administrators (*National Municipal Review* 1928). The survey results indicated that federal grants had "stimulated state activity" in the aided fields, that "federal

supervision had improved state standards of administration,” and that federal aid had *not* “led to federal interference in state affairs.”

The administration of New Deal grant programs came under the probing eye of Key (1937). Key’s analysis was extensive, intensive, and magisterial. He found several “mechanisms of federal control” (Key 1937, 369). Among the highlights of his observations were (1) the focus on service rather than regulatory activities, (2) the blending or mixing of federal and state personnel, (3) the autonomy or non-coordinated character of aided activities, (4) the involvement and impact of interest groups on behalf of grants, and (5) the absence of an overall strategy guiding federal grants. Two statements draw these and other administrative themes together:

The American system of grants has had important effects on the federal-state fiscal system, but incidentally rather than by design.

The states became in effect, although not in form, agents of the central government in the prosecution of activities deemed by Congress to be clothed with a national interest (Key 1937, 367, 368).

Key’s insights are impressive for penetrating and articulating several basic issues surrounding grant programs at a critical juncture. They are also significant because they crystallized issues that have persisted through the several decades following his groundbreaking study.

5. Federal Aid to Cities

One aspect of the mature stage of federalism did escape Key’s attention, undoubtedly because it was defined as external to his state-oriented focus. This was the development of direct links between the national government and localities, specifically with cities. Gelfand (1975, 222) says, “The New Deal marked a new epoch in American urban history; overlooked by the Constitution and ignored in a century-and-a-half on national legislation, the cities finally gained some recognition from Washington.” An ACIR (1978a, 17) report notes that during the 1930s, “new links between Washington, DC and city halls were forged; and the legal basis for the expanding intergovernmental partnership [was] clarified.” Elsewhere, Martin (1965, 111) called the New Deal a “geologic fault line” in the development of national–local relations. Clark (1938) called the expansion of grants generally and funding directly to cities “the rise of a new federalism.”

Our thesis modifies or challenges these assertions—less in terms of the novelty of national–local relations, but more in terms of national–local contacts as a logical extension or enlargement of prior precedents. The urbanizing character of the country presented growing economic, social, and fiscal problems. These problems resulted in demands that some national politicians viewed as an opportunity to build a political coalition. Mollenkopf (1983, 254) devotes a book to support the thesis that “over the five decades since the New Deal, the web of federal urban development programs and the intricate national-local political coalitions woven largely by Democratic political entrepreneurs succeeded in reshaping American cities and in establishing the Democrats as the normal majority party.”

Direct national–city contacts, however, antedated the 1930s (Elazar 1967). Here we turn to urban historians for insights on federal–urban partnerships that were well established but long neglected (Mowry and Brownell 1981). This research and writing is variously titled: “the martial metropolis” (Lotchin 1984), “the city and the sword” (Lotchin 1982), and the “municipal-military complex” (Lotchin 1979a, 1979b, 1979c). These terms convey the *alliance* between cities and their associated and/or proximate military installations. A few passages will serve to make the essential points.

The marriage of a city and the sword in California was a voluntary affair. It was also a very seminal alliance, contributing to the alteration of American governmental structures, encouraging the westward reorientation of American culture, and aiding in the legitimization of the military in American society.

Although the federal urban partnership is usually attributed to the period of the New Deal and to civilian and reform impulses, it goes back at least to the Progressive Era and has military as well as civilian roots (Lotchin 1982, 2).

Lotchin's study of San Diego and its wooing of the Navy reveals the city's success in the 1920s. By the early 1930s, one-third of the area's total employment was Navy dependent.

Perhaps the most significant theoretical point emerging from this literature is the importance of viewing the city as an *independent* variable (Lotchin 1984). This approach argues that cities are more than malleable entities molded like putty by state or national governments. Cities, according to this view, have a measure of influence over their destiny; many municipalities (and urban areas) have exerted significant influence over their future(s), especially during the expansion of peacetime military activities since World War II. Precedents and learning experiences in this skill of urban entrepreneurship, however, were first developed during the period from 1890 to 1940.

Although the states were sometimes bypassed and subordinated during the New Deal, it would be wrong to assume that these capstone years of mature federalism left the states supine and atrophied. One observer (Gulick 1933, 420) thought that the states were moribund: "I do not predict that the states will go, but affirm that they have [already] gone." A more extensive, balanced, and retrospective view was offered by Paterson:

The New Deal produced neither federal dictation, a completely cooperative federalism, nor a new state progressivism. Instead, it helped create a rather flat mixture of achievement, mediocrity, and confusion. For all the supposed power of the New Deal, it was unable to impose all its guidelines on the autonomous 48 states (Paterson 1969, 202).

All but one of the 15 permanent (continuing) grant programs emerging from the New Deal period were national-state in character (MacDonald 1940). The decentralized character of the party system seemed to assure that state interests would be taken into account even in the severest of economic emergencies. The varied depression-generated emergency actions also produced a significant set of direct national-local relationships that bypassed the states. Just as T.R. Roosevelt had convened state governors (in 1908) that led to the creation of the National Governors Association (NGA), F.D. Roosevelt convened the mayors of large cities (in 1933). That in turn led to the creation of the American Municipal Association-US Conference of Mayors (AMA-USCM).

By the end of the New Deal and the 1930s, the mature phase of federalism was confirmed. By this we mean that the national government had consolidated its constitutional, political, administrative, and fiscal preeminence. The states, while far from vibrant, were at least functional and showed signs of entering the twentieth century, albeit reluctantly in many instances (Goldwin 1961). And cities as well as other localities had exerted a presence and gained national attention on a variety of issues.

Stated differently, this mature stage was more than merely national preeminence. While it held that distinction, the mature stage was also a period and circumstance when most governments—national, state, and local—had become increasingly active politically, fiscally, and administratively. Electoral publics had been galvanized and mobilized to support the promotion and delivery of public services.

This mature stage prompted some commentators to see "the obsolescence of federalism" (Laski 1939). Laski's attack was a pragmatic one: the US federal arrangement did not work; it was obstructionist, negative, ineffective. The states, in particular, were too large to deal with local problems and too small to address regional issues. Various direct and indirect rejoinders to Laski (and other critics) were made in defense of federalism (Benson 1941). In one sense, however, Laski won the conceptual or debating point. As he wrote, a new term, *intergovernmental*

relations, had surfaced as an alternate phrase to describe the changing and evolving nature of national–state–local relationships.

Continued use of the term *federalism* was common (Dye 1990; Earle 1968; Elazar 1969, 1987; Friedrich 1968). But more frequently and regularly it appeared in hyphenated form or was preceded by a variety of adjectives. Indeed, by the 1980s one scholar could tally 497 different types of federalism (Stewart 1982, 1984). This progressively varied and even helter-skelter use of the term did two things. First, it diminished the clarity, utility, and precision of the term; like a coin of the realm too long or too much in circulation, it (federalism) lost some of its luster and value (Davis 1978). Second, the conceptual (but not necessarily practical) decline opened the way for the new concept, IGR.

V. INTERGOVERNMENTAL RELATIONS (IGR): ORIGINS AND EMERGENCE 1940–1960

The year 1940 is an arbitrary date for the origin and later emergence of IGR as a term describing the altered character of American federalism. The year’s significance attaches to the appearance of *The Annals* (Vol. 207, 1940) titled “Intergovernmental Relations in the United States.” The editor (W. Brooke Graves 1940) assembled 26 articles covering not only national–state, interstate, and national–local relations, but also regionalism and inter-local relationships. A nine-page bibliography (Culver 1940) contained over 150 references to books, articles, and reports published almost exclusively in the 1930s.

The multiplicity and concentration of references tend to confirm that IGR, as a concept, originated in the 1930s (Wright 1975). The earliest documented formal use of the phrase was by Snider (1937, 909). The most likely originator and person who popularized the term, however, was William Anderson. Anderson (1970) acknowledged that “there is no one person whose name is more fully associated with the early use of the term (back in the 1930s) than my own.” Anderson used the term not only in his American Government and Constitutional Law courses, but in a graduate seminar titled “Federalism and Intergovernmental Relations” (Anderson 1970). From that seminar emerged the extensive research and several monographic studies focusing on IGR in Minnesota (Anderson 1960).

Two passages from Anderson’s overview assist in identifying and defining IGR:

[It] designates an important body of activities or interactions occurring between governmental units of all types and levels within the [US] federal system ...

It is human beings clothed with office who are the real determiners of what the relations between units of government will be. Consequently, the concept of intergovernmental relations necessarily has to be formulated largely in terms of human relations and human behavior (Anderson 1960, 3).

To this we would only add that, in one sense, there are no intergovernmental relations; there are only relations among officials who govern in different roles in diverse and numerous units of government. The point cannot be pursued here, but it should be noted that this “human” dimension is one important feature that distinguishes IGR from federalism.

It is unnecessary to devote further space to the origin and initial elaboration of IGR as a concept. Sources are readily available (Anderson 1960; Durham 1940; Graves 1964; Wright 1975, 1990b). Indicative of the early self-consciousness about the term was Anderson’s (1946) *Federalism and Intergovernmental Relations: A Budget of Suggestions for Research*. Ten years later Graves (1956) prepared an exhaustive (120-page) bibliography (issued as a Committee Print) for the House Subcommittee on Intergovernmental Relations. The classified (but not annotated) set of references to books, reports, articles, pamphlets, and bibliographies contained about 3500 entries. Graves (1958) later completed an annotated chronology of IGR events in US history.

It is also unnecessary to discuss the distinctive features of IGR and the multiple reasons for using IGR instead of federalism for a variety of analytical purposes (Anderson 1960; Wright 1974, 1975, 1982b). Nor is it imperative to offer a detailed disaggregation of the several phases of IGR since the 1930s (Wright 1997). In place of concept clarification and elaboration we focus on how IGR developed in the field during the emergent period of 1940–1960. This focus confirms the strong administrative link emphasized by Durham (1940), a link extensively reflected in articles appearing in the *Public Administration Review (PAR)* during these two decades. (For an assessment of IGR in the 1935–1960 period, see Wright 1985). The 1940s, of course, were dominated by cooperative efforts to prosecute and recover from World War II. The 1950s was a decade of introspection, analysis, and reassessment (Wright and White 1984). During these years, however, the number of new grant program authorizations proceeded at a rapid but relatively little-noted pace. From 1946 to 1960, nearly 100 new grant programs were authorized!

A. WARTIME AND POSTWAR IGR

The epitome of cooperative administration during wartime was captured by Bane (1942) in describing the extensive and impressive national–state–local collaboration in implementing rationing programs. Bane subsequently served as executive director of the Council of State Governments (CSG) and as the first chairman of the ACIR (1959–1969). No one deserves the title of Mr. IGR more than Frank Bane. He noted at this early date that the wartime experience was producing a “new system” that he called “cooperative government” (1942, 95). The blending of national–state–local relations in a smooth and effective mode would later be developed as “marble cake” federalism by McLean (1952, 2) and Grodzins (1960b).

The degree, depth, and dedication of cooperative IGR in wartime was demonstrated by the commodity rationing program put in place following Pearl Harbor on December 7, 1941. White (1942) describes the process and results as follows:

Legal authority to ration was vested in the War Production Board but delegated by it to the Office of Price Administration (OPA). Four days after Pearl Harbor the former Office of Production Management froze the supplies of rubber; on December 14, 1941, the OPA was given the task of creating a rationing system; and on January 5, 1942, the system was in country-wide operation, an administrative feat due to the genius of Mr. Frank Bane, then director of field operations, OPA.

Another perceptive observer saw the wartime effort as producing a result that was unlike prior patterns or precedents. Bromage (1943, 35) saw IGR as developing an identity or life of its own:

Like all other aspects of public administration, intergovernmental relations are undergoing constant readjustment to the times and conditions. War so alters conditions in public affairs that federal-state-local realignments are taking place from month to month. Cooperative government by federal-state-local authorities has become a by-word in the prodigious effort to administer civilian defense, rationing, and other wartime programs. Intergovernmental administration, while it is a part of all levels of government, is turning into something quite distinct from them all.

Clearly, IGR and its administrative or operational aspects had emerged in wartime as a distinctive feature of the American system.

Evidence abounds on the growth of the field during the 1940s. Lutz (1949) wrote a review, titled “Intergovernmental Relations at the Grass Roots,” of seven reports produced by several councils on intergovernmental relations. These local-level councils were citizen-based groups established in one or more counties within each of four states. A national coordinating committee had illustrious members, for example, William Anderson, Frank Bane, Luther Gulick, Paul McNutt, and Harold D. Smith.

To show where the field stood in the late 1940s it is useful to cite statements underlying the creation of the councils, the problems they considered, and the judgments they made (Lutz 1949, 119–120):

1. The control over local affairs and local government has gradually been more and more centralized into the state and federal governments.
2. That unless checked, this gradual drift will continue.
3. That the rapid expansion of government has confused the minds of people at the “grass roots” and there is no clear-cut understanding as to what phases of government should properly and profitably be federal, state, or local.
4. That unless clarified and the trend reversed it may eventually undermine democratic government.
5. That this gradual centralization of authority and control has been due in part to the feeling by those at the top and in control, that the people at the local level are not capable of handling the problems which arise.
6. That the council does not believe this to be true. It believes that the feeling has arisen, not as a result of the incapacity of the people, but rather is it due to the absence of interagency coordination at the local level and a positive citizen interest and participation in the direction of “our government.”
7. That greater responsibility for operating and improving government services should rest in the hands of persons at the local level.

Citizen involvement and inter-level coordination were issues decades ago, as well as later (Browning 1983; Porter 1975). So also was the problem of state budgeting for federal aid. An article by Ader (1950) considered “state budgetary controls of federal grants-in-aid.” The author found such controls “woefully lacking” and noted that “perhaps of even greater importance is the fact that requests for grant funds by the state operating departments are not channeled through the state budget offices” (Ader 1950, 92).

A prime example of inter-level exchange was described in an article by Crook (1951), “The Pacific Coast Board of Inter-Governmental Relations.” This unique entity was organized on a voluntary, cooperative basis in 1945 under the joint sponsorship of key officials from all levels of government in the West Coast states. It had a membership of 71 officials and held quarterly meetings that rotated among the three regional cities of Seattle, Portland, and San Francisco. Crook, who worked as the administrator of the board, offered the following conclusions about the five-year efforts on the entity:

In five years of successful operation the Pacific Coast Board of Intergovernmental Relations has demonstrated the feasibility and value of cooperation among all levels of government in the West Coast area. It has fostered a regard for the regional point of view in officials presumed to be confined jurisdictionally to the consideration of problems assumed also to be so confined. In so doing it has been able to bring about a regional point of view concerning basic regional requirements, and thereby to increase the chances for perception of the specialized character of those requirements in Washington, D.C. Finally, it has been successful in promoting good day-to-day working relationships between officials who must consult across government lines on official business. Perhaps the organization and work of the board offers a pattern for intergovernmental cooperation in other regions (Crook 1951, 108).

Despite the apparent success of the board, it was disbanded in 1953 because of national-level domestic budget cuts and officials’ declining interest. Its disappearance seems representative of the fragile and fleeting nature of the early IGR administrative efforts.

B. THE 1950s: THE ACADEMIC DECADE

This period of IGR emergence is called the “academic” decade for a combination of reasons (Wright and White 1984). First, a national commission, launched in 1953, produced extensive studies on IGR. Second, scholars produced a variety of books, monographs, and articles exploring various policy, program, and political dimensions of the topic. Third, the decade was one of relative quiescence from the standpoint of broad national domestic policy initiatives, although numerous new but modest grant programs were put on the statute books.

Two noteworthy IGR national policy actions were dual defense pieces of legislation—the Interstate and Defense Highway Construction Act of 1956 and the National Defense Education Act of 1958. The former established and funded the system of interstate highways, while the latter was a response to Russian space research (the Sputnik launch). In spite of the substantial funding of these two programs, federal aid to the states increased from only \$2.4 billion in 1950 to \$7.0 billion in 1960. The number of grant authorizations, which had risen from about 30 in 1940 to around 60 by 1950, continued on a constant climb to approximately 130 in 1960.

The midpoint of the decade was punctuated by the appearance of the report of the Eisenhower-sponsored Commission on Intergovernmental Relations (1955) chaired by Chicago business executive Meyer Kestnbaum. The summary report and extensive supporting studies, committee reports, and research documents provided a major impetus to IGR as a concept and a topic worthy of sustained interest. The impetus and interest were expressed in several directions: (1) legislative, (2) institutional, (3) policy/political, and (4) academic.

The report of the Kestnbaum Commission prompted the Intergovernmental Relations Subcommittee of the House Committee on Government Operations to initiate a series of hearings, reports, and staff studies over a four-year period. (See Wright and Peddicord (1973) for a three-decade listing of government documents on IGR, including a full list of House and Senate documents, ACIR publications, and all the reports on the Commission on Intergovernmental Relations.) These legislative-based efforts contributed to a 1959 institutional result—the creation of the ACIR (Wright 1965).

A policy/political product of the presidential commission was an effort to return some functions (and tax sources) to the states. Proposed by President Eisenhower to the Governors’ Conference in 1957, the proposal was to revert to the states responsibility for vocational education and waste treatment facility construction programs, together with a tax credit on local telephone service to pay for these programs. This turn-back strategy was aborted by a combination of political, economic, fiscal, and administrative difficulties (Grodzins 1960b; Maxwell 1960, 1962; Shore 1959a, 1959b; Subcommittee on Intergovernmental Relations 1958b). The final report of the joint national–state committee to explore the turn-back proposals acknowledged the obstacles confronting its devolution efforts (Joint Federal-State Action Committee 1960). A general treatment of increasing grant problems appeared as the Joint Committee disbanded and the ACIR came on line. Mushkin (1960) reviewed the experience of the 1950s and the unsuccessful efforts to modify and manage the growing aid programs and the failures to overcome the numerous “barriers to a system of federal grants-in-aid.”

After 1959, the ACIR became the official and sometime definitive observer/researcher on IGR. Prior to the ACIR’s creation, the presence of organized, focused, and sustained research on IGR was the exception rather than the rule. The main exceptions in the 1950s may be briefly noted and are clearly marked as emerging from the academic arena.

First, 10 volumes appeared from the long-running Minnesota studies of IGR under William Anderson’s direction. The various research projects focused on courts (Talbot 1950), highways (Gomez 1950), education (Morlan 1950), public health (Wyatt 1951), social welfare (Raup 1952), employment security (Rourke 1952), local government (Ylvisaker 1956), finances (Anderson 1956), and participants’ perspectives (Weidner 1960).

Second, Morton Grodzins initiated the Federalism Workshop at the University of Chicago with support from Meyer Kestnbaum. Grodzins and several associates explored the “new American system” from a variety of approaches and perspectives (Elazar 1962; Elazar et al. 1969; Grodzins 1960a, 1960b, 1966).

A third source of reflections on the system appeared in a Gaus (1956) review essay of four major works on IGR—those by Anderson (1955), the Commission on Intergovernmental Relations (1955), Macmahon (1955), and White (1953). Gaus’s evaluations were mature, balanced, and reflective, befitting a person of his academic stature. His concluding comment was “We are an unfinished country, and have yet to know our landscape” (Gaus 1956, 109).

Two aspects of that national landscape were not addressed or sketched by Gaus. One was the future landscape of mature IGR. The other was the urban-metropolitan scene—the focus of considerable attention in the postwar era. This second topic concludes our discussion of the emergent period of IGR.

The topic of metropolitan problems, policies, and reforms was exceptional and distinctive for the amount of sustained attention it received in the postwar period. Significant initial attention to the topic had, however, antedated that war (Jones 1942; Ketcham 1940; Merriam et al. 1933; Reed 1942; Studenski 1930).

In 1953 Jones reviewed several “Metropolitan Studies” (1953) dealing with problems in and reform proposals for Atlanta, Birmingham, Chicago, San Francisco, Toronto, and Washington, DC. Jones, a well-established metropolitan scholar, regretted the fact that there were no more metropolitan governments than in 1942, when his own book on the subject was published. Nor was there progress since 1930 when the first wave of metropolitan interest and reform began. This hard fact remained despite Jones’s noting the existence of “many more published and unpublished studies of government in metropolitan areas—official survey reports, doctoral dissertations, prizewinning essays and monographs” (1953, 58). The failure of reform proposals was likely to continue, Jones concluded, until research was done to “supplement the administrative and structural studies of metropolitan communities with studies of the metropolitan organization and relationships of attitude and opinion-forming agencies” (1953, 63).

Jones’s synthesis of metropolitan organization and reform issues focused largely on inter-local and indigenous approaches to solving the IGR problems of these burgeoning areas. A broader approach or strategy was emerging, however (Wood 1958, 1959, 1961). This involved national-level actions and policies. It was exemplified by Grant’s (1954) article, “Federal-Municipal Relationships and Metropolitan Integration.” Grant noted that “virtually all of the metropolitan area studies devote considerable attention to every conceivable alternative solution or device for metropolitan integration, yet omit any consideration of federal intervention in a day when it is customary for frustrated cities to go to the federal government for help in any and all problems” (Grant 1954, 259). Grant’s preferences for national involvement to promote metropolitan change emerged near the end of his essay. “The continued failure to evolve even a reasonable facsimile of integrated metropolitan government for any of the 170 standard metropolitan areas in the United States makes it clear that new avenues of integration need to be explored” (Grant 1954, 267).

Grant’s call for active and even aggressive national involvement on metropolitan issues landed on productive scholarly turf but on barren political and policy soil in the “academic” 1950s (Proctor 1953). A steady stream of research and recommendations continued for the remainder of the 1950s and into the early 1960s (Bollens 1956, 1957, 1961; Connery and Leach 1960). During the 1950s, no less than 15 *PAR* articles or book review essays treated metropolitan problems directly or indirectly. A major bibliography on metropolitan problems appeared in 1957 (Governmental Affairs Foundation 1957). But deliberate and purposeful national action on urban/metropolitan issues awaited the arrival of the 1960s and a broader base of political support. That support would develop in the mature period of IGR.

VI. IGR: A QUARTER CENTURY OF MATURATION AND METAMORPHOSIS 1960–1985

In 1962, Senator Edmund S. Muskie of Maine described IGR as the “hidden dimension” of government, “performing as almost a fourth branch of government in meeting the needs of our people, it nonetheless has no direct electorate, operates from no set perspective, is under no special control, and moves in no particular direction” (Muskie 1962). Creation of the ACIR in 1959 can be construed as a convenient (albeit arbitrary) transition point marking IGR’s passage from a hidden or emergent stage to a mature period. The formal organizational recognition signaled by the ACIR’s creation gave IGR a deliberate, continuing, and institutional focus (Wright 1965). The ACIR did not spring suddenly from Zeus’s brow, however. Instead, it was the culmination of a decade-long series of events, actions, and recommendations.

The first Hoover Commission (1949a, 1949b) made only incidental mention of IGR, but it did recommend “that a continuing agency on Federal-State relations be created with primary responsibility for study, information, and guidance in the field of Federal-State relations” (Hoover Commission 1949a, 36). This proposal was given added impetus by the temporary Kestnbaum Commission on Intergovernmental Relations, which called for “continuing attention to interlevel relations” (Commission on Intergovernmental Relations 1955, 86).

Attention was devoted to IGR during the late 1950s but it required four years to create a record and build support for establishing a permanent body. Two streams of activity aided the boomlet that resulted in the 1959 passage of Public Law 86-380, which chartered the ACIR. These two sets were mentioned previously: (1) legislative hearings on IGR by the House Subcommittee on Intergovernmental Relations, chaired by Rep. L. H. Fountain, and (2) presidentially inspired turnback efforts channeled through the Joint Federal-State Action Committee (Subcommittee 1956b, 1956c, 1957, 1958a, 1958b).

By 1960, the ACIR was operational and was poised to observe political, policy, administrative, and legal gyrations involving subsequent shifts in IGR. Any effort to chart the changes in IGR since 1960 has faced formidable difficulties. In commenting on IGR developments from the 1960s into the 1980s, Derthick observed that “for a student of federalism to make sense of the events [of this period] is no easy task” (1987, 67).

Any approach to a quarter century of IGR must be selective in two respects. First, it must proceed from some organizing principle. Second, it can sample only a small amount of the activities, actors, events, and research/writing flooding the public agenda under the label of IGR. The organizing principle selected for the following discussion is consistent with this chapter’s chronological motif. The sampling criterion is also parsimonious—developments that tend to be national in scope and institutional in focus. The orientation toward national and institutional patterns produces a bias against state–local, interstate, and interlocal relations as elements of IGR. Lack of attention to these IGR patterns is not an oversight; it results from trade-offs made under time and space constraints. An independent and significant chapter could be written (elsewhere) on state–local relations (Zimmerman 1972, 1983, 1995) and on interstate relations (Zimmerman 2002, 2004.; Bowman 2005).

A. MONITORING MATURATION AND METAMORPHOSIS

Prior to a discussion of successive five-year chronological periods, it is useful to reference selective sources that have charted and commented on IGR developments since 1960.

During its first 15 years the ACIR issued yearly reports that not only covered the Commission’s activities, research, and recommendations but also commented on annual and longer-term IGR patterns. In 1975, the ACIR initiated a quarterly publication, *Intergovernmental Perspective*. A

review of articles and events reported in this periodical offer a continuous education in IGR from the mid-1970s into the 1990s until the demise of the ACIR in 1996 (McDowell 1997).*

The ACIR during its lifetime was the foremost governmental agency whose primary mission involved monitoring of IGR developments. Numerous other agencies of the national government, however, produced research studies, policy analyses, reports, and recommendations affecting IGR (and federalism) matters. An earlier, dated, and provisional list was assembled in a bibliography by Wright and Peddicord (1973). Additionally, over 400 congressional committees and subcommittees were (and are) potential and actual loci for staff studies, hearings, and reports that affect the direction of one or more intergovernmental programs, policies, and politics.

In the 1970s and 1980s, two congressionally based analysis units made their presence known on the intergovernmental scene. The Congressional Budget Office, created in 1974, explores and presents policy options to the Congress on pending legislation, including alternatives on many intergovernmental proposals. Also, from the early 1970s through the 1980s, the General Accounting Office (GAO) became an assertive actor on IGR issues. The GAO at various times organized itself to focus explicitly on intergovernmental questions. In the late 1970s, for example, it developed a “program plan” (GAO 1978) to examine a wide range of intergovernmental policy and fiscal relationships such as grant-in-aid formulas and block grants. During the 1980s, the GAO created an Intergovernmental Relations Group within its Human Resources Division and developed an “intergovernmental research agenda” (GAO 1986). That group has since been disbanded and GAO’s focus on IGR was de-emphasized (Kincaid and Stever 1992).

Other sources and publications should be noted as centers for monitoring IGR during recent decades. Prominent are the regular periodicals of the so-called Big Seven public interest groups: National Governors Association (NGA), Council of State Governments (CSG), National Conference of State Legislatures (NCSL), National League of Cities (NLC), U.S. Conference of Mayors (USCM), National Association of Counties (NACO), and International City/County Management Association (ICMA). These include *Public Management* (ICMA, monthly), *Nation’s Cities* (NLC, monthly), *Counties* (NACO, monthly), *State Legislatures* (NCSL, monthly), and *State News* (CSG, monthly). The NGA does not publish a separate major periodical but produces a biweekly newsletter called “Governors Bulletin” that was dominated by intergovernmental issues. Accompanying these numerous periodicals, each Big Seven group has a website which provides current, if not extensive, coverage of intergovernmental affairs and their positions on fiscal, regulatory, and program issues.

The activities and periodicals of another relevant association need to be mentioned. The American Society for Public Administration (ASPA) publishes *Public Administration Review* (*PAR*) bimonthly. From 1940 to 1983, *PAR* published over 350 articles dealing with various aspects of IGR (Wright and White 1984). Since that inventory, the number of IGR-related articles appears to have increased. The ASPA also publishes *PA Times* on a monthly basis, and it consistently reports administrative developments that have IGR ramifications. Another ASPA-based source is the Section on Intergovernmental Administration and Management (SIAM), one of the major sections in the ASPA. It has produced a quarterly newsletter, *SIAM Intergovernmental News* since 1977. Since 1993, it has been a cosponsor, with the Vinson Institute of Government at the University of Georgia, in publishing *State and Local Government Review*.

Three other periodicals deserve mention and emphasis for coverage of IGR matters. First, the *National Civic Review* (formerly *National Municipal Review*) is a monthly (bimonthly since 1987) of long standing, dating back to the municipal reform movement in the early nineteenth century. Its articles tend to be brief and advocacy oriented, befitting its origins. For sheer reportage of events and issues that involve national–state–local interactions, however, it would be difficult to match the *National Civic Review* for long-term scope and illustrative detailed content.

*The ACIR was also disbanded (in 1996) because of budget reductions enacted by the 104th Congress.

The second journal is also broad, even catholic, in IGR scope, but is more recent in origin. Appearing first in 1971, *Publius: The Journal of Federalism* is a quarterly publication, originally from Center for the Study of Federalism at Temple University but subsequently shifted to the Meyner State and Local Government Center at Lafayette College. Its substantive strengths, diverse contributors, and innovative contents put it at the center of a scholarly nexus for the critical study of IGR and federalism. Worthy of special note since 1977 is the allocation of one issue of *Publius* to an annual review of the state of federalism.

The third periodical is *Governing: The Magazine of States and Localities*. Published since 1988 by Congressional Quarterly, Inc., this monthly magazine covers current issues of IGR interest, noteworthy work of state and local leaders, program innovations, and assessments of trends and report cards on performance. Regular columns feature developments on the state and local financial, management, technological, and political fronts, among others, as well as a "Potomac Chronicle" and "Urban Notebook." Annually, *Governing* recognizes "Public Officials of the Year" for their contributions.

The prior publications can be regularly monitored or selectively consulted for exposure to a large variety of approaches and analyses of IGR over recent decades. It would be impossible to extract the IGR content of these numerous sources. It is worthwhile, however, to mention two articles that review IGR trends and patterns over a two-decade (1960–1980) span. Stenberg (1980) was an ACIR staff member when he reviewed the impending shift from "the days of wine and roses" to the period of policy redirection and retrenchment called by one wag, "the evening of beer and daisies." Writing in *PAR*, he saw the turn of policy cycle toward what Miller would later refer to as "public sector performance: a conceptual turning point" (Miller 1984). Wright later called this "the contractive phase of IGR" (Wright 1988).

In *Publius*, a trio of authors reflected on the major events and chief trends affecting IGR in the 1960s and 1970s (Cole et al. 1983). Relying on a survey of scores of IGR academic observers, the authors attempted, quite successfully, to chart major events, actions, trends, and impacts prominent during the two-decade span. Table 11.1 and Table 11.2 provide a condensed configuration of their findings.

Both new and experienced/established observers of IGR can benefit from a reflecting reading of articles in *PAR*, *Publius*, and *Governing*. They frame the bulk of the quarter century that we now examine in five-year segments.

B. 1960–1965: POLITICAL PROCESSES, SHARED FUNCTIONS, CHANGING STRUCTURE

The political process and quasi-behavioral approaches of the 1950s had discernible impacts on the research and literature of the early 1960s. Grodzins' focus on the role of the party system as a variable explaining non-centralization in the American system clearly articulated process and behavioral themes (Grodzins 1960a, 1960b). In this respect he developed in greater depth a theme that David Truman had raised a few years earlier (Truman 1955). This theme was explored later in the period from two contrasting perspectives. Riker (1964) essentially subscribed to the party-as-decentralizer thesis in his well-known and highly critical book on federalism, in which he likened states' rights to racism. Buchanan (1965) on the other hand, had doubts about which way the supposed causal relationship ran. In "Politics and Federalism: Party or Anti-Party?" he hypothesized that the structural arrangement of federalism might be the variable that explained why American parties were decentralized. As will be reported later, the role of political parties as decentralizers and the influence of state and local officials in nominating candidates for national office declined steadily from this point onward.

Both the process and behavioral approaches current in this period were represented in articles appearing in the second special issue of *The Annals* (1965) devoted to IGR. In addition to Buchanan's article on parties and federalism, contributions were included on pressure groups (Anderson 1965), public officials' attitudes (McCulloch 1965), and "A Behavioral Approach to the Study of

TABLE 11.1
Major Trends Affecting IGR in the 20 Years 1960–1980

Rank Order	Trend or Development
1	Increased flow of federal dollars to state and local governments
2	Disaffection with government and growing concern for government accountability, manifested in the late 1970s
3	Growing dependence of local governments (particularly cities) on state and federal aid
4	Increased suburbanization and continued loss of population by many inner cities
5	Emergence of Frostbelt–Sunbelt regional competition and growing tensions between haves and have-nots
6	Increasingly significant role of the courts in intergovernmental areas accompanying a concern for equity in the system
7	Increased federal regulation of use of shared revenues
8	Broadening of federal aid, especially general revenue sharing
9	Increase in number and influence of Washington-based public interest groups
10	Blurring of private and public sector
11	Increased use by federal government of formulas to target federal aid dollars
12	Rise and increased influence of regional governing and coordinating bodies (COGs, sub-state national organizations, multi-state regional organizations)
13	Increased state aid to local governments
14	Increased adoption by states of income taxes
15	New or updated state constitutions

Intergovernmental Relations” (Ostrom and Ostrom 1965). The last selection was one of the earliest rational or public choice approaches to IGR.

Grodzins also effectively elaborated the concept of shared functions, beginning with his widely distributed essay for the President’s Commission on National Goals (Grodzins 1960b). It was

TABLE 11.2
Ranking of Ten Major Social and Political Events Affecting Intergovernmental Relations: 1960–1980

Rank Order	Event
1	Vietnam War and the resulting inflationary spiral
2	Energy crisis: 1973 and 1979
3	Election of Lyndon Johnson: beginning of the Great Society (1964)
4	Demographic shifts: increasing proportion of young and elderly segments of the population
5	Rise of the Sunbelt states in population and political influence
6	Financial crisis of large cities, including the fiscal default of New York City
7	Urban riots, 1964–1968
8	Environmental movement
9	Election of Richard Nixon: resultant new federalism of the early 1970s
10	Watergate

extended and expanded in his posthumously published book, *The American System* (Grodzins 1966). Others, most notably Daniel Elazar, picked up the theme and applied it to current as well as long-term historical analyses (Elazar 1962, 1965, 1969). Graves, in his magnum opus *American Intergovernmental Relations* (1964), provided further detailed (even exhaustive) descriptive material. In the process Graves produced the first bona fide but ponderous (985 pages) text on IGR.

In other quarters, concerns over structure as well as process were thoughtfully articulated. The urban-metropolitan thrust of the 1950s bore fruit in strong pressures to create a cabinet-level department of urban affairs. Connery and Leach (1960) offered a balanced examination of the controversial issue. It was resolved politically by the creation of the U.S. Department of Housing and Urban Development (HUD) and in the welter of policy actions that were part of the Great Society (Creative Federalism) thrust of the early Johnson presidency (ACIR 1963; Cleaveland 1969).

Structural aspects surfaced in surprising places. The structure of representation in state legislatures had been an intense political issue for years. In *Baker v. Carr* (1962), the Supreme Court produced a landmark decision that extended the court's interpretation and application of the equal-protection clause of the Fourteenth Amendment. The 1962 court decision would eventually result in a significant restructuring and reorientation, from a policy/representational standpoint, of the legislatures of most states. Landau (1965), however, saw the reapportionment case in a different light. In an essay titled, "*Baker v. Carr* and the Ghost of Federalism," he projected the effects of the case as accelerating the decline and atrophy of federalism in the United States (Landau 1965, 1973) largely because it would foster the increased nationalization of many issues.

C. 1965–1970: FINANCES, THE STATES, AND URBAN AFFAIRS

The late 1960s recorded numerous and even violent political whirlwinds across the American intergovernmental landscape. The tracking of only three of these storm systems—finances, the states, and urbanization—seems sufficient to give a sense of IGR weather patterns in this volatile period. For some sense of how tense and pressurized this period was, the following offers a flavor of the times:

The people don't give a damn about "intergovernmental relations." It smacks of the excuse for inaction. The people want bread, not excuses. The people want jobs, not intergovernmental explanations. The people want opportunity for their children, not intergovernmental expiations of guilt (Abrams 1969, 378).

From a fiscal standpoint the shower of federal dollars emerging from the Great Society grant-in-aid programs was sufficient to turn the eyes of many observers and participants, especially state and local officials, into a fixed gaze on Washington. All of the Big Seven Public Interest Groups set up offices in Washington, DC. The ACIR produced a definitive volume of the fiscal balance/imbalance in the IGR system (ACIR 1967). A major argument of the report was the need for a more balanced configuration of federal aid—a shift from categorical/project grants toward block grants and revenue sharing.

This point of view was shared by most, if not all, state and local officials. It was also supported in some academic quarters, although the view was far from unanimous (Anderson 1968; Heller 1966; Perloff and Nathan 1968; Wright 1968). Opinions in the Congress, however, were much more ambivalent, if not adamantly opposed. One senior member of the House of Representatives produced a book that argued that revenue sharing should be conditioned on and require a wholesale reorganization of state and local government (Reuss 1970).

Reuss's views, needless to say, did not carry the day. But his focus on state-level issues was consistent with a significant shift in attention toward state government. The nature of this focus on the states was diverse, disparate, and eclectic. One common theme running through the research and

writing by practitioners and academics, however, was the relevance and significance of the states in IGR.

A political and policy focus dominated much of the first wave of state-oriented analyses. Jacob and Vines (1965) put forth “a comparative analysis” in the first edition of their groundbreaking state politics book. Eight editions have subsequently been published (Gray and Hanson 2004). Interstate IGR was a core component of the text, although not explicitly acknowledged. Furthermore, the policy chapters on education, highways, welfare, and so forth, prominently incorporated significant state national and state–local elements.

The policy focus on the states mushroomed as Dye, Sharkansky, and others sought explanations for varying expenditure-based output measures in numerous political and economic variables. Dye’s (1966) book seemed to open the floodgates, and in the mainstream was Sharkansky (1968, 1970), looking at inter- as well as intra-governmental factors affecting state expenditures. Sharkansky (1972) followed his heavily statistical analyses with a more interpretive work on state policy accomplishments and opportunities. Lowi’s writings (1964, 1972, 1978) accentuated the policy focus, one that would subsequently be explored by many authors, e.g., Anton (1989).

Two interpretive, non-quantitative volumes came on line but were distinctively different from the policy output literature on the states. Both were explicitly and extensively intergovernmental in focus. Elazar (1966) adopted “a view from the states” in looking at IGR in the mid-1960s. Two subsequent revisions (Elazar 1972, 1984) did not falter from this state-based perspective, with a special emphasis on state political cultures (or subcultures).

More activist and advocacy oriented was Governor Terry Sanford’s (1967) book *Storm over the States*. This call for state revival originated the famous “picket fence federalism” metaphor to describe the narrow, insular, programmatic/professional loyalties inherent and implicit in federal aid programs. The basic tension between program specialists and policy generalists had, however, been clearly identified somewhat earlier (Advisory Committee on Local Government 1955; Weidner 1955, 1960). Sanford also highlighted the difficult position and stereotypical view of the states in terms of their support for and sensitivity to local governments:

The states are indecisive.

The states are antiquated.

The states are timid and ineffective.

The states are not willing to face their problems.

The states are not responsive.

The states are not interested in cities.

These half-dozen charges are true about all of the states some of the time and some of the states all of the time (Sanford 1967, 1).

The seeds of ideas about the states’ strengths strewn through Sanford’s book did not land on barren soil. Instead, and in no small part due to Sanford’s initiative, two entities were formed to promote a revitalized IGR role for the states. One was the permanent Education Committee of the States promoted jointly by Sanford and Harvard President James B. Conant. The second was the temporary (two-year) Institute for State Programming for the 1970s. A former governor headed the latter group. He discussed both organizations under the rhetorical title “Are the States Here to Stay?” (Campbell 1968).

Few doubted the continued presence of the states. More crucial were questions about the competence and capacity of the states to function as active and effective participants in the expanded partnership. No less a distinguished scholar than Samuel Beer of Harvard was drawn to this subject, and he chose to focus on a policy question that seemed least likely to be a state-level interest—poverty. Beer and his associates found problems but also positive prospects in state actions dealing with poverty, at least in Massachusetts (Beer and Barringer 1970).

An extensive focus on the states did not preclude concern for and attention to urban issues (Mogulof 1971; Long 1972). Indeed, one of the observations that could be made about the late 1960s was that urban problems were uniformly acknowledged to be intergovernmental in character. Roscoe Martin had long recognized this fact but many others had failed to appreciate its significance. Martin's (1965) book *The Cities and the Federal System* both emphasized and crystallized the national–local (urban) nexus while delivering a devastating critique of the “reluctant” states. He called national–local relations “the expanded partnership” (Martin 1965, 109).

The national–urban link was played out more prominently for the public in lengthy, well-orchestrated Senate hearings starting in 1966. A parade of mayors and other local officials testified about urban malaise and sociopolitical conflagrations then called “urban riots” (Subcommittee on Executive Reorganization 1966–1968). The public rebukes, recriminations, and animosity present in national–local exchanges between Senator Robert Kennedy and Los Angeles Mayor Samuel Yorty, for example, are indicative of the tensions surrounding the expanded partnership.

As the decade drew to a close, two volumes seemed to address the mood of the moment and offer some hope for the future. Sundquist assessed the national-level dimension (and much more) in his *Making Federalism Work* (1969). The book's subtitle, “A Study of Program Coordination at the Community Level,” accurately conveyed its central focus and content. The title, however, only hints at its more prescriptive dimensions. On this latter point the following is illustrative: “Somewhere in the Executive Office [of the President] must be centered a concern for the structure of federalism—a responsibility for guiding the evolution of the whole system of federal–state–local relations, viewed for the first time as a single system” (Sundquist 1969, 246).

A second volume that in a sense closed the 1960s was Campbell's (1970) book *The States and the Urban Crisis*. The volume emerged from an American Assembly conference on the topic and its state–local focus neatly complemented the primary national–local thrust of Sundquist's analysis. Eight essays appeared in the Campbell volume. Rather than raking the states over the IGR coals, the analyses were more balanced and even positive on the role and prospects for the states. There was, however, an urgency in the message calling for state action:

Time grows short for America.

Torn by a divisive war, a generation gap to end all generation gaps, and a polarization of white and black society, America is in the midst of a deepening political, economic, cultural, spiritual and moral crisis perhaps nowhere more strongly felt than in the great urban centers of the country.

No one individual, institution, system, or level of government can single-handedly solve the urban crisis. The problems that have been allowed to develop unchallenged, and the institutions that have been allowed to disintegrate are too complex to admit of a single simple solution.

However, the states if they choose can exert strong leverage to break loose vast amounts of available but as yet untrapped resources for community development. By virtue of their position, state governments possess the power, and the obligation, to attack all of those problems which in sum equal the urban crisis (American Assembly 1970, 3).

It is difficult to overemphasize the significance of events for IGR in this period (1965–1970) as well as subsequently. Two volumes written from retrospective stances offer insightful observations on IGR in the later 1960s. Frieden and Kaplan (1975) focus primarily on the urban dimension of the Great Society, especially model cities. Welborn and Burkhead (1989) offer a broad-gauged assessment of the Johnson administration's impact on the American political and administrative systems. They note that, “Perhaps the most important change was the enlarged scope and penetration of national power. A multitude of intergovernmental programs were enacted that thrust the national government [administratively and politically] into much closer and more intimate involvement in the operations of sub-national governments” (Welborn and Burkhead 1989, 1).

D. 1970–1975: REGIONALISM, REORIENTATION, AND IMPLEMENTATION

If the 1960s were a feisty time for IGR, then the 1970s marked a yeasty period. Important shifts and changes occurred, but they seemed to arise more from the leavened lump of hard work, perseverance, and patience than from dramatic political confrontations and conquests. These shifts in the first part of the decade are classified and linked with three terms—regionalism, reorientation, and implementation.

The regional theme had emerged along two major tracks and a minor one. The minor path involved regional reorganization within national cabinet departments to achieve ten common or standard regional boundaries for the administration of many federal aid programs. From this effort emerged fledgling federal regional councils aimed at coordinating programs and policies between and among national administrative agencies (Derthick 1974). For example, this initiative permitted if not promoted the concept of annual arrangements between national agencies and a single city, under which a lump sum of funds was disbursed pursuant to a contract relating to a citywide development strategy negotiated between the mayor and the US Department of Housing and Urban Development (*National Journal* 1973). From a local or state perspective the standardized federal regions allowed these officials a common one-stop location for dealing with the regional administrative headquarters of major national agencies. This administrative regionalism during the Nixon presidency was, it could be argued, the seed from which the plant, stem, and flower of IGM later grew and blossomed.

On a much broader policy and structural scale were issues associated with statutory multi-state regional bodies such as the Tennessee Valley Authority (TVA), Appalachian Regional Commission, and various river basin and economic development bodies. These agencies, of course, were created during or before the 1960s, but several factors converged to make them a political/policy issue in the 1970s. One precipitating force was President Nixon's aim to reduce or eliminate many of these entities. The most significant works on these agencies were produced near the time of their highest political visibility (ACIR 1972, 1973–1974; Derthick 1974). The ACIR explored several aspects of multi-state regionalism and the federal system (ACIR 1972). The continued relevance of these entities through the 1970s was demonstrated when the ACIR produced a "regionalism revisited" report in 1977 (ACIR 1977d).

The IGR changes percolating in a structural arena via Councils of Governments (COGs) were approaching the boiling point in the federal aid arena (ACIR 1972; Wikstrom 1977).^{*} Nathan (1975, 127) referred to these currents as a "new structuralism." Pressures had been building to force some clear, if not sharp, reorientations in the funding and administration of categorical grants-in-aid. Two books by the same author could easily serve as literal book ends for this policy reorientation during the 1970–1975 period.

Derthick (1970) produced a probing analysis of the political dynamics revolving around the categorical public assistance program. In discussing "prospects for the grant systems," she documented with precision and clarity the configurations of influence around grant programs and the tensions associated with proposals for change. She noted:

If it is easy to exaggerate the defects of the grant system, however, and to attribute to it flaws that are actually general features of contemporary politics, it is also easy to exaggerate its advantages; as a way of dispersing power and safeguarding pluralism—supposedly its chief virtues—it is flawed by a tendency to foster powerful, self-serving intergovernmental alliances between official agencies that share values and interests as well as functions, and that gain autonomy through the system's operation (Derthick 1970, 243).

^{*} Councils of governments (COGs) have a long (50-year) history as sub-state regional entities for interlocal communication, cooperation, and coordination. By the 1970s there were over 600 COGs in existence across the nation. The number has declined since that date but they remain viable and constructive entities in many states.

To restrict this autonomy the IGR battle cry of the early 1970s was called New Federalism. Ironically, Derthick documented five years later the hazards of rash action in jerking control away from professionals in the social services field. The combination of a loose law, novice political appointees, and other factors in health, education, and welfare produced “uncontrollable spending” for social services grants (Derthick 1975).

The rallying cry among academics for a New Federalism sounded like reveille and it drew many followers. But the bugle notes were also heard by differently tuned ears. For governors, mayors, and other officials engaged in intergovernmental lobbying (Haider 1974), the notes sounded “charge”—especially after general revenue sharing. For at least one skeptical academic the tonal pattern signified a recognition that, “Federalism—old style—is dead. Yet federalism—new style—is alive and well and living in the United States. Its name is *intergovernmental relations*” (Reagan 1972, 3).

General revenue sharing (GRS) passed the Congress and was signed by President Nixon in 1972. Seldom, if ever, has a single national assistance program been subjected to such intensive and extensive analysis. Four substantial works focused on the descriptive, prescriptive, and political aspects of its passage (Beer 1976; Dommel 1974; Stolz 1974; Thompson 1973). Studies of its specific policy impact(s) are legion, as are analyses of its general effects on IGR (*Annals* 1975; Caputo 1975; Caputo and Cole 1974, 1976; Nathan 1975; Nathan et al. 1975; Nathan and Adams 1977; Oates 1975; Wright et al. 1975; Scheffer 1976). The National Science Foundation (NSF) allocated \$3 million for research projects to evaluate the formula and process impacts of GRS (Lucas 1976).

Strategies to reorient federal assistance programs spread far beyond GRS, however. Block grants, also called special revenue sharing at this juncture, were part of the New Federalism package, but were destined to lag behind GRS in enactment (Dommel et al. 1978, 1980). But both GRS and block grants, as well as existing categorical grants, raised the issue of state and local policy management capacities. This concern gave rise to a joint NSF/OMB task force that was ultimately called the Study Committee on Policy Management Assistance (SCOPMA) (Executive Office of the President 1975). The most accessible place to review and evaluate the content of SCOPMA is in a special issue of PAR (Clayton et al. 1975; Macaluso 1975).

Reference to policy turns attention to the third and final prominent IGR theme developing in the early 1970s—implementation. The process of getting a program to produce results rarely is far from an intergovernmental administrator’s mind. Beginning in the 1970s, however, the concept of implementation commanded the attention of practitioner and scholar alike. (One term that may rival implementation in spanning the often wide gulf between scholar and practitioner is *incrementalism*). The starting point for the burgeoning body of literature on implementation seems clearly identifiable. Pressman and Wildavsky (1973) launched its meteoric rise with their book *Implementation: How Great Expectations in Washington Are Dashed in Oakland*. Pressman (1975) followed with his broad-ranging and insightful analysis of the interaction between federal programs and Oakland’s city politics.

One clear consequence of the onset of the implementation literature was to emphasize, even dramatize, the shortfall between performance and promise (expectations). It was almost as if the research literature was saying: “You can’t get there from here.” The retrospective studies and pessimistic views were not this simplistic, of course (Hanf and Scharpf 1978; Salamon 1976; Warren 1978). There were critical appraisals that probed thoughtfully for lessons for the future. In looking at the model cities program, for example, Frieden and Kaplan (1975, 4) observed, “A careful reading of the federal implementation effort should help to define the future role for the federal government in reducing poverty and inequality, drawing on the experience of the 1960s but without repeating the overly optimistic assumptions and mistakes of that decade.”

The federal role issue will be addressed shortly. First, however, acknowledgment should be made of the appearance of a third issue of *The Annals* (1974) devoted to IGR. Edited by

Leach (1974), the volume contained 16 articles organized under the theme “Intergovernmental Relations in America Today.” The essays can be read for the purpose of understanding precisely what the title promises, the status of IGR near the midpoint of the 1970s.

E. 1975–1980: EVALUATION AND CODIFICATION

The federal aid policy shifts occurring in the early 1970s and the critical attitudes engendered by the implementation studies combined with other factors to produce new emphases and issues in the late 1970s. Only two themes—evaluation and codification—are discussed here.

Evaluation in the federal aid arena had clear antecedents in the research studies on GRS cited earlier. Indeed, the GRS renewal legislation in 1976 contained a provision requiring the ACIR to pursue broadly based evaluation studies. To say that this mandate was taken seriously is an understatement.

From 1976 through 1978 the ACIR published 14 volumes under its broad project title “The Intergovernmental Grant System: An Assessment and Proposed Policies” (ACIR 1977a,b,c,d, 1978a,b). The major block-grant programs were examined and several specialized studies were conducted, for example, the design and role of categorical grants (ACIR 1978a). The core of the Commission’s orientation can be found in a painstakingly thorough analysis on improving the management of federal grants (ACIR 1977b).

A second major ACIR evaluation effort closely followed the first. The Commission’s federal role studies were conducted from 1978 to 1980 and produced 11 volumes on the dynamics of national growth and influence in the intergovernmental system (ACIR 1980a,b,c,d,e, 1981, 1982). These exhaustive reports ranged from functional program analyses to ones broadly titled “Confidence and Competence” (ACIR 1980c) and “Collapsing Constraints” (ACIR 1980b). The groundwork laid in these studies led to the oft-quoted assertion that, “American federalism ... is in trouble. The federal government’s influence has become more pervasive, more intrusive, more unmanageable, more ineffective, more costly, and, above all, more unaccountable” (ACIR 1980d, 1).

Evaluation of IGR in the late 1970s moved far beyond the confines of the ACIR. The Brookings Institution, the Urban Institute, and the American Enterprise Institute (AEI) were three Washington-based centers of activity from which appraisals emerged. Richard Nathan at Brookings continued and extended his distinctive field research methodology to community development and manpower block grant programs (Nathan et al. 1977). Economic and econometric approaches to federal aid were pursued at the Urban Institute (Mieszkowski and Oakland 1979). More interpretive as well as more critical appraisals came from the AEI (Barfield 1981).

Outside of Washington the examinations of IGR were episodic, eclectic, and numberless. Sources with a strong policy focus may be cited but should not be construed as being fully representative of the mass of materials flowing through the research communities (Anton et al. 1980; Carroll and Campbell 1976; Couturier and Dunn 1977; Gramlich 1977; Jones and Thomas 1976; Larkey 1979; Lyons and Morgan 1977; Muller and Fix 1980; Rosenthal 1979; Stephens 1974; Stephens and Olson 1979; Wright et al. 1975).

The immense corpus of materials on IGR in the 1950s and 1960s had stimulated courses on the subject at some universities. (The authors have, separately and at various institutions, offered graduate and/or undergraduate courses on IGR, beginning in 1956 and continuing to the present). The scope and content of the courses were not as extensive as anticipated by a survey of academe (ACIR 1969). The field was ripe, one might say, for codification by a text that would offer the subject some focus, coherence, or synthesis.

Three efforts to fill this need appeared during the approximate period under discussion (Glendening and Reeves 1977; Walker 1981; Wright 1978). The Glendening and Reeves volume adopted a strong institutional interaction approach with chapters on national–state, state–local,

national–local, and inter-local relationships. The Walker text gave considerable space to an historical survey of the evolution and adaptation of the IGR system since the eighteenth century. A second priority was on contemporary judicial, fiscal, and political dynamics, with special attention to the problem of system “overload” (Beer 1977; Walker 1979; Wright 1980). Wright’s text made a bow in the direction of history, mainly concentrating on “phases” of IGR during the twentieth century. Higher priority was given, however, to matters of finance, policy, and “participants’ perspectives.” That these texts did not spread eagle the field is evidenced by the appearance later of several text or text-type volumes in the 1980s.

F. THE 1980s: ELABORATION, REGULATION, RETRENCHMENT/REDIRECTION, AND MANAGEMENT

Efforts to bring cohesion and synthesis to the IGR field through textbooks produced mixed results. On the one hand, the diverse and amorphous character of the field almost guaranteed that no single text would fully and successfully cover the subject. On the other hand, the initial textual efforts prompted other writers to put their hand(s) to the plow handle and till the IGR soil.

In addition to revisions in the Glendening and Reeves (1984) and Wright (1982b, 1988) texts, three edited books of readings on IGR appeared in the 1980s. Furthermore, quasi-texts focusing on federal grants were published (Howitt 1984; Nice 1987; Nice and Frederickson 1995). Of more than passing interest is the fact that the text-type volumes combined federalism and intergovernmental relations in their titles or subtitles.

The three edited volumes attempted to provide both current coverage and broad-ranging exposure to IGR in the 1980s. Leach (1983) enlisted seven specialists to probe the field in the early part of the decade, just after the Reagan policy initiatives took shape. O’Toole in three editions (1985, 1993, 2000) offered a reader consisting of many selections ranging in content from Madison (*Federalist* No. 39) to Reagan’s first State of the Union message. A majority of the items came from the 1970s and 1980s. Dilger (1986) assembled fewer (17) but longer selections, all written in the early 1980s.

The persistence of issues associated with federal aid programs remained prominent into the 1980s (Clark 1983; Fossett 1983; Peterson 1981; Williamson 1983, 1990). Two volumes surveyed these issues in text-type fashion. Shapek (1981) offered extensive background material on grants management issues, particularly in the 1970s. Complementing Shapek’s managerial focus was a political orientation toward grants by Hale and Palley (1981). They adopted a “regulatory model” of the grants process, a theme addressed in the next few paragraphs.

In one sense the regulatory issues involving IGR are at least as old as the earliest conditional grant programs (circa 1887) and perhaps are as old as the Republic itself (Hanus 1981). Starting in the 1970s, however, and rising to prominence in the 1980s, was an array of issues cataloged under the phrase “regulatory federalism.” Perhaps the single most important source on the subject was a volume published by the ACIR (1984b). This thorough study examined the politics, policy issues, process aspects, impacts and reform proposals associated with intergovernmental regulation. A short (50-page) condensation the full report was also published (ACIR 1984a). The continued significance of the topic was confirmed by a reassessment study (ACIR 1993).

A major aim of the Reagan administration was deregulation—a policy thrust that began during the Carter administration. Three essays focused specifically on IGR regulatory reform in the 1980s. Mashaw and Rose-Ackerman (1984) offered an insightful analysis of national deregulation. Fix (1984) examined the conscious transfer of authority from the national government to the states. Elsewhere, Reagan (1987) offered a “marble cake” analysis of IGR regulation within the framework of a volume that attempts a comprehensive view of the politics of regulatory policy. In spite of deregulation rhetoric during the 1980s, the reality was that the greatest growth in federal regulations and preemptions occurred in the 1980s (ACIR 1993; Zimmerman 1991).

The topic of IGR regulation should not be closed without some references to other studies of regulatory issues (Brown 1980, 1981, 1983; Lovell 1981a, 1981b; Lovell and Tobin 1981;

Petkas 1981). Levine and Wexler (1981) provided a focused, readable, advocacy-based study of the enactment and implementation of the Education for All Handicapped Children Act of 1975 (P.L. 94–142). Its value rests mainly in dealing with the politics of lobbying and enacting (rather than implementing) this significant piece of intergovernmental legislation. In contrast to the Levine and Wexler case study, Katzmann (1986) completed a balanced study of implementing Section 504 of the Rehabilitation Act of 1973 as it applied to public transit systems. Katzmann's special concern for IGR emerged not only in his title, "Institutional Disability," but also in the normative question he posed: "Can the structures and incentives of institutions be changed so that policy processes and outcomes are less confused?" (Katzmann 1986a, 14). Another balanced and probing exploration of IGR regulation was Kettl's study of national guidance and direction efforts in the community development block grant program (Kettl 1981a, 1981b, 1983a, 1983b). The difficulties of national oversight and direction are the main messages emerging from much of the research on IGR regulation. A significant counterpoint to the incapacity of national-level direction is Chubb's (1985a,c) longitudinal study of the redistributive implementation of federal aid for elementary and secondary education.

The retrenchment and redirection feature(s) of IGR in the 1980s produced research and writing that nearly overwhelm an observer of recent developments. We refer, of course, to the origins, enactment, and implementation of what has been variously termed "the Reagan revolution" (Nathan 1986) or "the new direction in American politics" (Chubb and Peterson 1985). From an IGR standpoint the case has been made that the Reagan policies have been less than revolutionary and/or reactionary (Glazer 1986; Hecllo 1986; Palmer 1986; Wright 1988). A more accurate description of the IGR policy shift might designate it as "redirection" (Wright 1988). A preview of IGR directions appeared in a book edited by Hawkins (1982a), the individual Reagan subsequently selected to chair the ACIR. His term for the direction and content of the administration's IGR proposals was "reform" (Hawkins 1982b).

Regardless of the term employed to describe IGR since 1981, some sense of order and pattern can be imposed on these developments (Conlan 1987, 1988, 1998). One theme that emerged early to describe Reagan's New Federalism ideas was retrenchment, or decrementalism (Wright 1982a). An early, descriptive, and somewhat surface-level review of spending reductions, with specific focus on state–local impacts, was assembled by Ellwood (1982). This was followed by more in-depth analyses of the "consequence of cuts" by Nathan and Doolittle (1983). Continued assessments of "retrenchment and redirection" were contributed by Beam (1984) and Goldenberg (1984).

Time and temporal-oriented analyses gave researchers an opportunity to put the Reagan-induced changes into a longitudinal context. By 1985, Chubb (1985b, 306) could observe that "the centralized system of extensive targeted subsidies [to state and local governments] will not be swept aside by a sea change in national party fortunes; it is institutionalized." At Brookings, Peterson had directed a long-term research project monitoring changes in development, distributive, and redistributive grant programs. More could be said about the originality and significance of the research, but the relevant substantive point stated that "thus far federal policy has changed less than many anticipated" (Peterson et al. 1986, xii).

A major feature of the Reagan administration's policies of retrenchment and redirection was the consolidation of 77 categorical grants into nine block grants through the Omnibus Budget Reconciliation Act of 1981 (Conlan 1988, 172–3). The plethora of research studies and publications cannot be plumbed. Only a single quote is offered from one of several careful studies of block grant implementation: "In a word, the administrative rationale of block grant consolidation, and even the political rationale for returning decision-making authority to the states, has been largely vindicated by the experience since 1981" (Peterson et al. 1986, 29). Separate but complementary research focused on the administrative devolution of the small-cities community development block grant (CDBG) program from the national government to the states (Jennings et al. 1986).

Two other assessments of the Reagan New Federalism adopted an explicit institutional focus. One looked at Reagan and the cities (Peterson and Lewis 1986). The authors noted that “one of the most encouraging developments of the Reagan presidency, yet one that requires a rethinking of city behavior as we understand it, was the favorable economic and fiscal position that cities found themselves in at the beginning of the president’s second term” (Peterson and Lewis 1986, 11).

Nathan and Doolittle (1987) centered their attention on Reagan and the states, generally concluding that the states demonstrated significant and constructive resilience and response to Reagan-induced IGR policy changes. These IGR policy changes of whatever shape, substance, and effect, cannot and should not be considered in isolation from the broader economic, social, and political shifts of the 1980s (Yoo and Wright 1993). Fortunately an excellent summary set of perspectives on the Reagan years was produced as part of the Urban Institute’s large-scale study on changing domestic priorities (Palmer 1986).

We have pursued a quarter century overview of the maturation of IGR from 1960 to 1985 (Anton 1984). The time period is acknowledged as inexact. Furthermore, closing the discussion at the mid-1980s does not imply that the relevance of the concept and practice(s) of IGR ended or declined. For example, it has been suggested that following the peaking of a “contractive” phase of IGR in the mid-1980s, there was a shift to a “coercive-collage” mode in IGR during the late 1980s and 1990s (Wright 1992, 1997). Additionally, a fourth volume of *The Annals* (1990) devoted to IGR appeared at the end of the decade (Kincaid 1990a).

The continued relevance of national domestic leadership in the 1980s and 1990s must be acknowledged, for example, in the expanded use of national preemption statutes, the rise in unfunded federal mandates, and the greater use of crossover sanctions (conditions) associated with federal aid (Dye 1990; Kenyon and Kincaid 1991; Kincaid 1990a; Walker 2000). Perhaps ironically, at the same time studies called attention to the resurgence of the states (Bowman and Kearney 1986; Stenberg 1985). Nevertheless, the regulatory practices (and others) by the national government enabled critics and commentators to make a strong case that “coercive federalism” replaced cooperative federalism as the prevailing mode of national–state relations (Kincaid 1990b, 1996; Zimmerman 1991, 1992).

The coercive elements of IGR make it more than mere policy and political coincidence that several features of the 1994 Republican Party “Contract with America” attacked the extensive and intrusive use of national power(s) over state and local governments. The significance of the 1994 electoral turnout for FED and IGR was indicated in a 1995 survey of intergovernmental scholars and practitioners, in which the respondents rated the Republican Party gaining control of both Houses of Congress as well as thirty governorships as the top IGR event since 1980 (Cole et al. 1996, 31). The 1995 survey updated and extended the 1980 study that produced the results reported earlier in Table 11.1 and Table 11.2. Table 11.3 and Table 11.4 list the leading events and trends, respectively, for the 1980 and 1995 period.

A scan of the major IGR events of 1980 to 1995 (Table 11.3) provides the base for three notable observations. First, both political and fiscal events occupy featured roles and prominent status. Second, all of the major events are national in character or content. They involve national institutions, actors, or actions. The reported rankings would need to be extended through the top twenty events before a non-national action was included. Third, the top-ranked events are linked to all three national-level institutions: the Congress, president, and Supreme Court. Each entity attained high rankings for its impact(s) on federalism (FED), IGR, and IGM.

One can imagine the title of a future essay which might address the long-term impact of mid-decade political changes: “From Management to Politics: The Decline of IGM and the Resurgence of FED.” The meaning and import of such a prospective essay requires an exposition of the origins, emergence, and maturation of IGM as a concept and of the administrative practices it represents.

TABLE 11.3
Major Intergovernmental Events: 1980–1995

Rank Order	Events
1	Republican party wins control of the US Congress and 30 governorships in 1994
2	The election (1980) and reelection (1984) of Ronald Reagan as president
3	General revenue sharing is not renewed by Congress (1986)
4	Americans with Disabilities Act of 1990 passed, prohibiting discrimination and requiring access in/to all public services and facilities
5	Supreme court decision: <i>Garcia v. San Antonio Metropolitan Transit Authority</i> 469 U.S. 546 (1985) overturning <i>National League of Cities v. Usery</i> 426 U.S. 833 (1976)
6	Omnibus Budget and Reconciliation Act of 1981 enacted
7	Clean Air Act Amendments of 1990 passed establishing deadlines on state/local governments involving smog, acid rain, and airborne toxins

VII. INTERGOVERNMENTAL MANAGEMENT (IGM): 1970s–2000s

Intergovernmental management (IGM) is a term of fairly recent vintage, first employed in the early 1970s. The sections that follow will discuss its meaning, origins, evolution, and comparative maturity. These are followed by concluding comments aimed at highlighting the interconnection(s) among IGM, IGR, and FED.

A. THE MEANING OF IGM

We acknowledge at the outset that there is no fixed or consensual definition of IGM. Under these conditions there is an advantage to examining the concept from an exclusionary approach (see, however, Wright and Krane 1998).

Some grasp of IGM accrues by clarifying what it is *not*. One notable contributor to the concept's development and clarification identified several features that he placed outside the domain of IGM (Agranoff 1986). The excluded items were cataloged in the context of the delivery of human service programs among multiple local and urban-metropolitan governments.

TABLE 11.4
Major Trends Affecting Intergovernmental Relations: 1980–1995

Rank Order	Trend Development
1	Rising costs of health care and health insurance
2	Federal aid growth rate declines; drops from 1978 peak (26.5%) as a proportion of state–local outlays
3	Shift of US population from greater Northeast to Southeast and West
4	Public disaffection and distrust of government increases
5	Significance of regulatory federalism increases (coercive impacts of court decisions, legislative actions, executive orders)
6	Unfunded and underfunded mandates increasingly incorporated in congressional actions
7	Widening of social and economic disparities continues between central cities and suburbs

Source: From Cole R.L., Stenberg, C.W., and Weissert, C.S., *Publius*, 26, 25–40, 1996.

The elements placed beyond the bounds of IGM were:

- Fundamental change in social structure(s), basic power relationships, or fiscal responsibilities;
- Realignment(s) in national–state–local relationships;
- Major intergovernmental shifts in program or functional activities;
- Significant policy revisions or redirection in the scope of service level(s) of existing programs;
- Structural change in metropolitan governance (Agranoff 1986, 1–2).

IGM, in other words, takes systems, structures, policies, and programs largely as givens. It concentrates more on incremental and innovative adjustments in managerial activities that enhance service delivery. It focuses less (or not at all) on major changes that alter significant political, economic, and social equilibrium. In place of systemic changes IGM centers attention on networks of effective implementation.

There is an alternate exclusionary approach to clarifying IGM. Simply put, IGM is not FED nor is it IGR. The differences among the three concepts have been discussed elsewhere (Wright 1983, 1987, 1990a). The differences include (1) leading actors/participants, (2) political quotient, (3) value scope, (4) means of conflict resolution, (5) authority relationships, and (6) jurisdictional involvement. The distinguishing features of IGM on each of these characteristics emerge below.

It is possible to highlight historically and compare conceptually the features of IGM in relation to FED and IGR. This task is facilitated by Figure 11.2, using a time line identifying the origin of FED at the founding of the Republic (Circa 1790). The origin of IGR is placed in the 1930s and IGM is identified as originating in the 1970s.

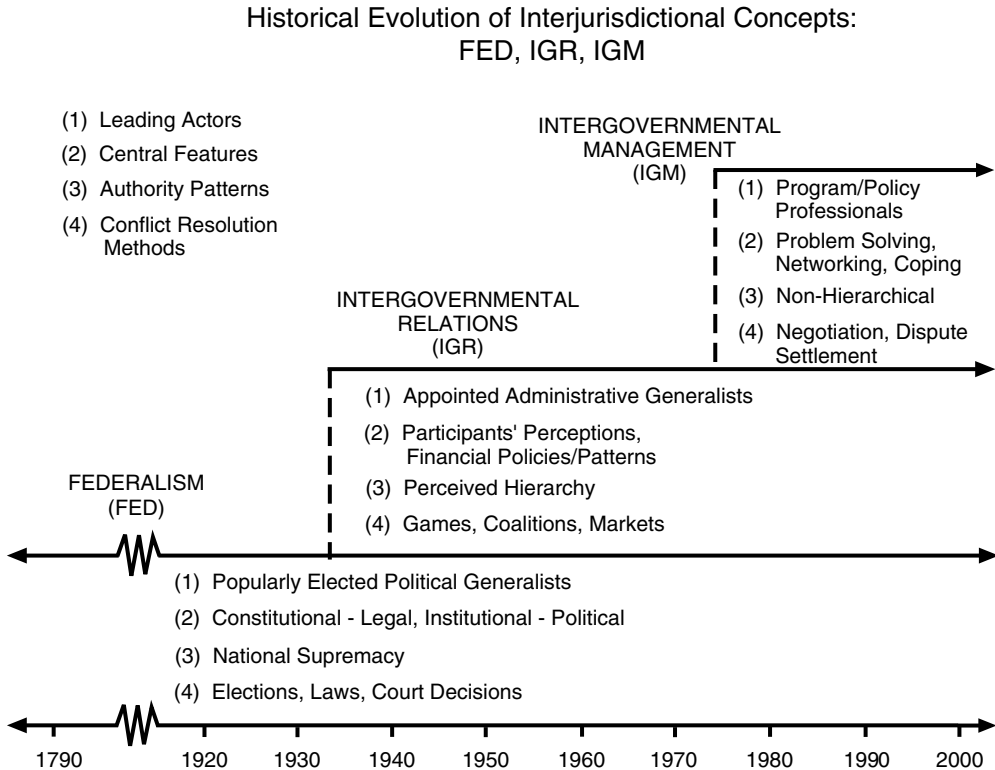

FIGURE 11.2 Historical evolution of interjurisdictional concepts: FED, IGR, and IGM.

Besides historical sequencing, Figure 11.2 provides a summary of four characteristics on which IGM departs from or contrasts with FED and IGR. These comparisons are (1) leading actors, (2) central features, (3) authority patterns, and (4) conflict resolution methods. The following discussion of IGM addresses its distinctive characteristics as well as the origin and emergence of IGM as a significant concept for the practice of public administration in an inter-jurisdictional context.

The most common components initially identified with IGM have been those of problem solving, networks and networking, and coping/managing under uncertainty (Agranoff 1986; 2001; Agranoff and Lindsay 1983; Agranoff and McGuire 2001, 2003; Gage and Mandell 1990; Mandell 1979). Marando and Florestano (1990) subsequently clarified and added noteworthy features in moving “Toward a Theory of IGM.” They grounded their assessment within the blending (or continuum) of politics and administration as well as linkages to FED and IGR historically, descriptively, and analytically. They observe, for example, that “neither politics nor management can be minimized by researchers in their effort to understand governmental performance and capacity” (1990, 294). They also note that “the distinguishing feature of IGM is that it emphasizes the management process” (1990, 299).

Marando and Florestano offer a summary judgment: “IGM is a bold step toward recasting the politics/administration issue within the context of contemporary assessments of the American federal system” (1990, 299). This statement frames their substantial (eight-item) comparison of IGM with IGR as well as their questions aimed at clarifying how IGM helps improve the understanding of human and organizational behavior:

Must all involved parties have visible stake in the outcome for IGM to be successful? How much inequality in the authority, status, and resources among intergovernmental actors can be assumed in the IGM process? To what extent do different problem areas require variations in IGM approaches? (Marando and Florestano 1990, 299).

The central features of IGM can now be summarized through a series of questions and responses:

1. Who are the leading actors or prime participants in IGM? They are the program/policy professionals first, followed closely by administrative generalists, for example, city managers. The central players on the IGM stage are “technocrats” (Beer 1978a) and “policy professionals” (Peterson et al. 1986).
2. What is the level of partisan politics in IGM? The level is modest, if not minimal. Effective program implementation and problem-solving strategies in service delivery are the primary or focal issues.
3. What goals or values tend to dominate IGM? The chief aims involving IGM are achieving positive program results through skillful public management (Wright 1990a).
4. What are the main means of conflict resolution in IGM? In contrast to elections, courts, and legislation for FED, and apart from coalitions, games, and markets for IGR, conflicts are resolved in the IGM arena through bargaining, negotiation, and dispute settlement methods. When or where conflicts cannot be resolved, the differences are endured, tolerated, accommodated, or “coped with” (Agranoff 1986, 1989; Mandell 1990).
5. What is the distinctive character of authority relationships in IGR? In contrast to national supremacy (contingent hierarchy) for FED and different from the often-perceived hierarchy (asymmetric influence) for IGR, nonhierarchical networks or matrix patterns of influence characterize IGM (Mandell 1990). A level playing field is the most common venue for IGM.
6. What jurisdictional entities are the featured participants in IGM? *All* governmental entities—national, state, and local—are the structures within which IGM functions. In this respect, IGM operates on the same institutional base(s) as FED and IGR. As noted

earlier, however, IGM encompasses more than merely units of government (Agranoff 1986, 1989, 1990). It includes a significant degree of policy making in administration/management (the policy-in-administration continuum), and the prominent presence of private and/or nonprofit sectors in the service delivery process(es). The latter element has been referred to as the public-private sector mix, or the "array of public and private actors" with "membership in several implementation structures" (Mandell 1990, 35). The mention of non-profit and for-profit entities in connection with IGM incorporates one feature that dramatically contrasts IGM with FED and IGR. The scope, significance, and implications of the participation of these nongovernmental entities in policy/program implementation cannot be explored or developed in this limited space and framework. One brief illustration of its significance comes from a survey of state administrative agency heads in 1998 that included questions about privatization and contracting for service delivery. Of the 800 state agencies that used third parties for service delivery, 60% contracted with other governments, 70% with nonprofits, and over 80% with for-profit organizations (Choi and Wright 2004; Choi et al. 2005).

We have considered what IGM is as well as what it is not. Based on this set of conceptual clarifications and distinctions it is useful to look at IGM across the three decades of its origins and evolution.

B. THE ORIGIN AND EMERGENCE OF IGM: THE 1970s

No single or specific date has been or can be confirmed for the origination of IGM. The approximate time of its gestation and birth, however, can be reasonably fixed as the early 1970s. Two special issues of *PAR* presented substantial manifestations of the problems, issues, and questions connected with a "management" approach to inter-jurisdictional relations (Clayton et al. 1975; Grosenick 1973). Limited space prohibits an attempt to summarize or synthesize the dozen articles in "The Administration of the New Federalism" (Grosenick 1973), or the 21 essays in "Policy Management Assistance" (Clayton et al. 1975).

It is sufficient to note, however, the "top-down" or national-based springboard from which IGM was launched. A joint OMB-NSF management initiative culminated in the 1975 *PAR* issue. The initiative was called SCOPMA (Study Committee on Policy Management Assistance). Its report, *Strengthening Public Management in the Intergovernmental System* (Executive Office of the President 1975), came in several parts in addition to the special issue of *PAR*. These included an OMB document, an NSF volume of 1200 pages containing 40 background papers, and a 40-minute color video cassette. In a curious and ironic twist, the NSF director of this project became persona non grata among national administrative agencies for his role in unleashing (through the various SCOPMA activities) a torrent of state-local criticisms and lobbying for general revenue sharing among other reforms of how "the feds" conducted intergovernmental business.

Apart from personalities, career conflicts, and bureaucratic byplays, a central point remains. The origin of IGM in the 1970s was largely nationally initiated, Washington-based, and hierarchical in tone and temperament. Subsequent activities during the remainder of the 1970s appeared to confirm what Stever (1992, 347) later called "the hierarchical approach to intergovernmental management dominant during the 1970s." A list of reports and activities included the following:

- ACIR, *Improving Federal Grants Management*. (Washington, DC: A-53, February 1977b)

- ASPA, *Strengthening Intergovernmental Management: An Agenda for Reform* (Washington, DC: April 1979)
- Executive Office of the President, Office of Management and Budget, *Managing Federal Assistance in the 1980s*, Report to the Congress pursuant to P.L. 95–224 (Washington, DC: March 1980)
- Creation of the Section on Federalism and Intergovernmental Relations within APSA in 1976
- Creation of SIAM (Section on Intergovernmental Administration and Management) within ASPA in 1978
- Creation of NAMA (National Assistance Management Association) in 1979.

C. IGM EVOLUTION IN THE 1980S AND 1990S: FROM TOP-DOWN TO BOTTOM-UP

The 1980s reflected a secular if not a sea-change shift in outlook and approach to IGM. The multiple forces at work might be provisionally classified in two categories: practical/political and intellectual/ideological. The first includes the significant intergovernmental policy redirections that accompanied the Reagan administration's New Federalism approach, which featured an ill-fated proposal to federalize Medicaid and Food Stamps in return for the states taking over welfare (Conlan 1987, 1998; Farber 1983; Williamson 1983, 1990; Walker 2000; Yoo and Wright 1993). In the second category are the sharp academic attacks on the concept of IGM. These took to task the hierarchical, technocratic, and non-constitutional dimensions of the term (Elazar 1981; Gordon 1980; Schechter 1981). It is curious but not coincidental that these three referenced critiques of IGM all appeared in *Publius: The Journal of Federalism*.

We take as given (but unproved) that the double-barreled attack of practical politics and academic argument undercut the hierarchical foundations on which IGM was constructed in the 1970s. Two possibilities emerged from those circumstances. One was that the concept might atrophy and disappear as a consequence of having few real-world, empirical referents. The second option was to fill the seemingly vacant conceptual space with new and different real-world operating experience(s). The second option was the path pursued, whether purposely or providentially. Intergovernmental management, in short, lost its national-based, hierarchic connotation. Those elements were replaced by state-local, and especially locally based, bottom-up practice(s), research, and new conceptualization (see Figure 11.1).

The following references reflect the relevance and significance of the bottom-up approach to understanding IGM through the 1980s and the 1990s: Agranoff (1986, 1989, 1990); Agranoff and Lindsay (1983); Gage and Mandell (1990); Jennings and Krane (1994); Jennings and Zank (1993); Johnson and Heilman (1987); Peterson et al. (1986); Rosenthal (1984); and Stoker (1991).

The locally based, community-focused, bottom-up approach to IGM was reflected in the popularization of the term governance to capture the multiple actors involved in pursuing public purposes. Government and IGR actors were involved but were not the exclusive players. According to Dodge governance has evolved into "... a more inclusive term to encompass: (1) all community interests affected by challenges and necessary to their resolution, not just government institutions, and (2) the collaborative problem-solving mechanisms needed to design timely strategies as well as the government institutions and other service-delivery mechanisms needed to implement them" (Dodge 1996, 38).

During the 1990s, the Reinventing Government movement swept the country, and its principles embodied the concept of governance (Brudney et al. 1999; Burke and Wright 2002). Developed by Osborne and Gaebler (1992) and based on their experiences working with local governmental and non-profit organizations, the authors called upon governments at all levels to operate in an entrepreneurial manner and adopt the following 10 principles as features of reinvention (Osborne and

Gaebler 1992; Osborne and Plastrik 1997):

- Government should steer (through policy) rather than row (through implementation) and make greater use of alternatives to in-house service delivery.
- Agencies should be driven by mission rather than rules.
- Agencies and administrators should be outcome and results oriented instead of input and process oriented.
- Citizens should be considered customers, instead of clients.
- Administrators should empower communities to participate in the delivery of services through management councils, teams, and other processes.
- Competition should be encouraged within the public sector (i.e. bidding for tasks) as well as between government and the private sector.
- Agencies should earn money through user fees and profit centers.
- Authority should be decentralized.
- Prevention should be an objective in addition to amelioration or remediation of a problem.
- Governments should leverage the marketplace rather than just create public programs to solve problems.

Although coming from the bottom-up the powerful message conveyed by Osborne and Gaebler was heard at the national level. One consequence was establishment of the National Performance Review (NPR) headed by Vice-President Al Gore to steer the reinvention of federal management practices—from customer service to procurement system reform to work force downsizing—as a means of creating a national government that “works better and costs less” (Gore 1993). By its fifth anniversary, Gore’s reinventing government program had attained an overall grade of B by authors of a Brookings Institution study (Carroll 1995; Kamensky 1996; Kettl 1998; Thompson and Ingraham 1996). This emphasis on governmental effectiveness was underscored by Congress’ enactment of the Governmental Performance and Results Act of 1993 (P.L. 103-62), which required each federal agency to prepare strategic plans, identify major goals and objectives, establish performance targets and measure progress. An analysis of several IGM strategies that were intimately connected with the “performance movement” of the 1990s was provided by Radin (2000).

The Clinton administration sought to achieve its reinvention goals in a number of interesting inter-jurisdictional ways. One approach, which balanced recipient flexibility with grantor accountability was the performance partnership. Under this arrangement, states could voluntarily enter agreements with regional offices of the Environmental Protection Agency (EPA) and shift funds across major EPA grant programs. States were held accountable for making progress towards EPA’s national environmental goals.

A different example of the bottom-up approach to IGM during the 1990s was the Clinton administration’s welfare reform initiative, which included numerous waivers granting states considerable discretion in advance of the 1996 legislation. President Clinton had promised “to end welfare as we know it.” His signing of the Personal Responsibility Work Opportunity Reconciliation Act of 1996 (P.L. 104-193) signaled bipartisan recognition that the time was opportune to turn over greater responsibility to the states and localities. The cornerstone of welfare reform, the Temporary Assistance to Needy Families (TANF) block grant, replaced the Aid to Families with Dependent Children program, which was established during the New Deal. Significantly, the National Governors Association played an influential role in designing and building political support for the welfare reform legislation, which gave governors considerable discretion in using funds to accomplish the purposes of the legislation.

This new flexibility included setting priorities, determining eligibility, integrating state programs, streamlining and re-engineering delivery systems, creating and experimenting with

workfare programs, and engaging private and non-profit organizations in managing cases and delivering services. Although TANF was hailed by some observers as the frontlines of the “devolution revolution” (Nathan 1996) and a return toward a revenue-sharing model, the national government remained a powerful player. It retained a major financial role although contributions were capped at the 1996 level, a cause for great concern on the part of governors when welfare rolls began to grow during the recession starting in 2001. States were required to ensure compliance with minimum national standards and requirements, and to abide by program restrictions such as limiting aid to five years, requiring welfare recipients to find work within two years, curbing benefits for legal and illegal immigrants, and mandates to establish and pursue goals to reduce out-of-wedlock pregnancies and to provide education and training on statutory rape (Walker 2000, 163–164). As a result of this balancing of accountability with discretion, TANF could be viewed at best as a partial and contingent devolution instrument.

The implementation of TANF illustrated in multiple ways the significance of IGM, especially in the several states where second-order (state-to-local) devolution took place (Gainsborough 2003; Kelleher and Yackee 2002; Liebschutz 2000; Weissert 2000). Central to the core component of IGM was the manner in which national objectives incorporated in TANF traversed the multiple intergovernmental boundaries and actors. It gave IGM operational meaning at the local level (Cho et al. 2004). TANF as well as other policy initiatives in the 1990s (and later) prominently illustrated the bottom-up emphasis of IGM.

In Stever’s (1992) review of the Gage and Mandell work he captured not only a major theme of that book but also the three-decade reversal thesis in understanding and using IGM. Stever (1992, 347) notes that, “These authors attempt to stimulate the metamorphosis of a new paradigm for intergovernmental management, one that does not depend on central coordination by the federal government.” He extracts a further relevant assessment from the volume: “The policy arenas and intergovernmental networks the authors propose are consensually created from the bottom up in incremental fashion by actors in diverse institutional settings” (Stever 1992, 350). If Stever is correct, and we have no basis for doubting him, then IGM represents a further important “hidden dimension” of inter-jurisdictional and inter-organizational activity that is extensive, significant, and largely unrecognized (Muskie 1962). It is a current phenomenon that would fit Woodrow Wilson’s (1887) historic phrase, “of systems within systems.”

D. IGM: CLOSING OBSERVATIONS

Where does all this leave IGM? Quite simply, it leaves its future uncertain as to direction and significance. It suggests that IGM has yet to mature and that this discussion of IGM, in comparison to FED and IGR, is open ended.

This analysis of IGM has therefore been more exploratory and expository than empirical and explanatory. Few firm conclusions are forthcoming, but a few closing observations may serve as a useful summary. For brevity and focus they are listed below:

1. For three decades IGM has been the subject of controversy and metamorphosis. It has evolved, however, into a useful concept for practical, analytic, and theoretic purposes.
2. It is not surprising that IGM originated and emerged so prominently in the 1970s. The concept of management received endorsement and strong support from the highest office in the land—the presidency. Richard Nixon was one president who took the concept of management most seriously. Witness his initiative (among many) in changing the name of the old Bureau of the Budget to the Office of Management and Budget.
3. Public administration (and public administrators) cannot be separated from politics and policy processes. Neither can public administration be removed or isolated from the multidimensional features of FED, IGR, IGM. Marando and Florestano (1990, 309) “wondered if much of public administration is not now intergovernmental.” The gist

of this essay is that nearly all of public administration is inseparable from varying blends and balances of IGM as well as FED and IGR.

4. Good decision making, constructive conflict resolution, and effective policy implementation hinge on a strategic balance between actor roles and institutional responsibilities. One way to understand institutional responsibilities (activities/duties) is through the conceptual framework of IGM. Actor roles can be usefully understood in the three-category scheme of elected generalists, administrative generalists, and program professionals. These three types of officials each occupy significant roles, respectively, in FED, IGR, and IGM (Wright 1990a; Wright and Cho 2000).
5. As IGM evolved it included a wider range of actors, or “rowers,” in implementing programs extending beyond IGR to include private firms, non-profit organizations, and individual citizens. This *governance* framework continues to be relevant to the design and delivery of intergovernmental programs, even though the emphasis has shifted from top-down to bottom-up.

In spite of controversy, change, and evolution, IGM has persisted because management has become a pervasive and critical process in our society generally and in the public sector in particular. An expression of management’s significance was somewhat surprisingly offered by an historian. Hays (1991) discussed three decades of environmental policy in a section titled, “The Politics of Environmental Management.” His language provides an extended exclamation point to this essay’s emphasis on the prominence and pervasiveness of management:

As environmental politics evolved, its context shifted from broader public debate to management. Increasingly one spoke of air quality management, water quality management, forest management, range management, the Bureau of Land Management, Coastal Zone Management, risk management, river management, and wilderness management. Hardly an environmental problem could be dealt with outside the terminology and conceptual focus of management, and, in turn, management played a powerful role in shaping the world of environmental choice. The influence of management grew because of its power and its authority to coordinate discordant elements in the “system” on its own terms, and even more because it constituted the persistent institution of government, with ongoing day-to-day capabilities of communication and action. Institutional power was the stuff of political power; it arose from a continuous presence requiring that others reckon with it day in and day out; it set the bounds of choice if not the actual agenda. While the larger ideological debates in environmental affairs came and went, management shaped the world of day-to-day political affairs (Hays 1991, 49).

The M in IGM gives both symbolic and operational significance to management (and administration) in the larger arenas of politics, policy making, and governance in its broad sense. It expresses in a different manner what one intellectual leader of political science asserted several decades ago. “Bureaucracy,” by which Friedrich meant management and administration, “is the core of modern government” (1950, 37). Consistent with the historical context of the above quote and the temporal orientation of this essay, Schechter (1981) posed the issues involving IGM in the following terms:

The popular acceptance of intergovernmental management is not a historically discrete occurrence. The starting premise of this article is that “intergovernmental management” (as that term has developed since 1974) is best understood not as a president’s pipe dream but as the completion of the twentieth century revolution in public administration first enunciated by Woodrow Wilson. For its adherents, “intergovernmental management” is more than merely compatible with federalism; it is both the natural extension and resuscitating element of the twin commitment to federalism and managerialism in a time of scarcity—both of resources and leadership.

The basic difference between federalism and managerialism, and hence the tension between them, has to do with ends and limits. The end of federalism, in the American system at least, is liberty; the end of

managerialism is efficiency. In this sense, the challenge of public management consists largely in directing the “gospel of efficiency” to the constitutional ends of limited government (Schechter 1981, 127, 136).

We clearly cannot explore, much less revolve, the issues posed above within the context of this chapter. Perhaps a subsequent survey similar to this some years hence will reveal how experience with and analysis of FED, IGR, and IGM have been accommodated.

VIII. THE CONTEMPORARY SCENE: CONFLICTS AND CROSS-CURRENTS

The chronological motif guiding this chapter has produced a leveling or sameness among the numerous issues, events, developments, and shifts covered in this two-century review. It is neither feasible nor useful to recapitulate the temporal patterns woven into FED, IGR, and IGM. It is important, however, to note the undifferentiated status of the topics reviewed by this chronology. If we were to introduce some priority ordering in the maze of issues, problems, and developments sketched above, what underlying elements or dimensions would be among the most important and significant? We mention four dimensions that are explicit or implicit themes within the major sections. Three—constitutional (legal), political (politics), and fiscal (deficits and debt)—are addressed in Sections A and B below. The Fourth, administrative issues targeted towards contingent collaboration across multiple governmental boundaries, is considered in Section C.

A. BASIC DIMENSIONS

One dimension threading its way through the two-century pattern of governance involves *constitutional* questions and judicial interpretations. The constitutional foundations and the legal superstructure of governing constitute a fundamental framework for the functioning of the American political system. Some of the most difficult political questions are recast into legal form and are resolved by the courts in constitutional rulings. Often Supreme Court rulings in federalism cases are close calls. By 5–4 decisions the power balance between the nation and the states has shifted back and forth. Space prohibits an analysis of individual decisions and trends in judicial decision-making. However, scholars as well as state and local leaders generally agree that, with notable exceptions, the Court has usually reaffirmed national power and weakened the Tenth Amendment. According to Walker, the Court has continued to defer to Congress in interpreting the scope of the conditional spending power, the “... most centralizing provision of the United States Constitution” (Walker 2000, 211). State governments individually and collectively, however, have become quite sophisticated, skillful, and successful in pursuing cases in a strategic manner before the Supreme Court when they are parties to various judicial proceedings (Waltenburg and Swinford 1999; Pickering and Clayton 2004).

A second dimension could be labeled *political* in the broad sense of the term, but it takes on a more specific complexion as discussed here. The prime focus of the political dimension in this chapter has been the party system. The relationship between the party system and national–state power distribution remains problematic. Is there a causal link between party structure and decentralization? If there is such a link, in which direction(s) does the causal arrow run? Walker (2000) has provided one penetrating analysis of this issue. In a chapter titled, “A New Political System?,” Walker reviews how changed political dynamics in the United States, such as the growing influence of political action committees, escalating costs of campaigns, and other nationalizing forces, have weakened parties and served as conduits for “Slouching Toward Washington.”

A third dimension clusters around the dollar sign and is *fiscal* in character. Fiscal questions are clearly and closely related to political ones, but the twentieth century fostered a measure of independent or autonomous significance to intergovernmental financial problems and policies. Indeed, the “fiscalization” of the debate over Ronald Reagan’s New Federalism in 1981–1982

could be taken as one indicator of the extent to which FED and IGR issues were drawn in dollar terms. In some quarters this fiscal focus is seen as either undesirable or unproductive, or both. Phraseology attacking this fiscalization tendency includes such terms as “fiscal fixation,” “monetary myopia,” and “federal aid junkies.”

The continued prominence if not centrality of fiscal issues is attested to by several recent developments. One is the culmination during the 1990s of a dramatic shift in federal aid from places (governments) to persons (individual-based entitlements). Articles by Kincaid (1993a, 1993b) placed the shift in both historical and political perspective. The proportion of federal aid going to individual beneficiaries averaged 35% in the 1960s but averaged 61% in the 1990s, with a complimentary decline in aid channeled to places—cities, counties, etc. (Walker 2000, 4–5). Much of this shift was due to the rapid growth of Medicaid, a federal-state open-ended matching program providing health care coverage to low-income beneficiaries.

Another issue crystallized the condition under which finances spill over into the arena of “high politics” (Bulpitt 1983). An example was the proposed constitutional amendment to require a balanced federal budget. In the 1980s nearly two-thirds of the 50 state legislatures petitioned the Congress to call a constitutional convention for the purpose of proposing such an amendment. By the mid-1990s the politics of the issue had changed dramatically. The prospect that the Congress would place the balanced budget amendment before the states gave rise to political second thoughts among governors and state legislators.

The magnitude of federal budget reductions required by adopting the balanced budget amendment caused governors and state legislators to reassess its fiscal consequences for state government(s). Federal aid monies, for example, are among the so-called discretionary funds in the national budget that might experience the largest reductions mandated by a balanced budget requirement. Furthermore, not even the passage of 1995 mandate relief legislation by the Congress could ensure protection of the states (and localities) from a powerful congressional majority bent on imposing unfunded federal mandates in the face of federal budget constraints. In short, the Congress (Fiorina 1977), with the concurrence of the president and the Supreme Court, could pass the fiscal buck to the states with assured legal immunity and perhaps political impunity.

Similarly, state legislatures and governors could decide to “pass the fiscal” buck to localities, by reducing general assistance or school aid, for example, plus impose their own unfunded mandates on municipalities and counties. Local jurisdictions could do little to effectively oppose such actions. These prospective—and sometimes actual—steps by national and state decision-makers have been called “shift and shaft federalism” by local officials. It was explained as follows: “Nobody is innocent here. The feds stiff the states. The states stiff the cities and counties. Whenever one layer of government can push an unpleasant or costly responsibility down to the level below, it nearly always does so. The cities and counties would do it too, except they are on the bottom rung. They can’t cut taxes and services and then pin the responsibility on the Salvation Army. Or at least they haven’t thought of that yet” (Ehrenhalt 2003, 7). This phenomenon or process has also been identified as the “intergovernmental law of gravity—the buck drops down!” (Wright 1988).

By the late 1990s, pressure for a constitutional amendment was further reduced by the ability of President Clinton and Congress, thanks largely to revenues generated by the booming national economy, to balance the national budget and even generate a surplus. This breakthrough stimulated a different type of debate, one between those who wanted to return the surplus funds to citizens by cutting national (and related state) taxes and those who wanted to invest these monies in public programs.

A second example of the convergence of finance with politics was the Transportation Equity Act for the twenty-first century, TEA-21 (P.L. 105-178), which was passed by Congress in 1997. Building on its predecessor, the Intermodal Surface Transportation Efficiency Act of 1991 ISTEA (P.L. 102-240), the legislation provided substantial federal funds (\$218 billion from a trust fund between 1998 and 2003) for a wide range of transportation and related infrastructure needs—from highways to mass transit to bike paths to train stations (Dilger 1992, 1998; Marbach and Lackrone 2002).

Accompanying the inter-modal approach was a strong national policy re-emphasis on regional collaboration through establishment of Metropolitan Planning Organizations to plan for and coordinate TEA-21-funded projects. This strategy had been significantly weakened by the Reagan administration. A large and diverse coalition was responsible for passing TEA-21, including state and local elected and transit officials, the highway lobby, regional planners, environmentalists, and historic site preservationists. The program has been judged a success in establishing a comprehensive approach to planning and funding transportation. Walker, for example, called it a “healthy sign” of balance between units at the center and periphery, emphasizing both IGR and IGM (Walker 2000). Yet when the legislation expired in September 2003, Congress failed to renew it. Special interest pressures, reflecting Sanford’s “picket fence federalism” metaphor, sought to remove national funding from non-traditional transportation projects and return to reliance on separate highway, transit, and other wish lists of pork-barrel politics in awarding federal aid. Stopgap funding was provided under a continuing resolution, but in one observer’s view advocates will be forced to “... fight the usual rear-guard action and be lucky if they hold their own” (Walters 2003, 14). On August 10, 2005 President Bush signed the new transportation bill P.L. 109-59, the “Safe, Accountable, Flexible, Efficient Transportation Equity Act: A Legacy for Users” (SAFETEA-LU). The \$268 billion bill contained a record number of nearly 6,500 individual projects requested by Republican and Democratic members of Congress. These special “earmarks” totaled more than \$24 billion.

As indicated above, it is possible to differentiate *fiscal* issues from purely *political* ones. But it is difficult if not impossible to isolate the two. This inseparability is one lesson emerging from the election of the Republican-controlled 104th Congress. The 1995 battle over the balanced budget amendment (which fell short by one vote in the US Senate) was only one of numerous issues in which politics and finances were inextricably intertwined. These linkages are likely to have immense consequences for FED, IGR, and IGM well into the twenty-first century, especially as huge annual deficits and a steadily climbing federal debt are projected for several years ahead.

B. TOWARD CONTINGENT COLLABORATION: FOUR EXAMPLES

Recent election results and presidential initiatives have sent mixed signals about the location and responsibility for actions affecting the US systems of inter-jurisdictional relations. The successes of Republican candidates for national and state executive and legislative offices since the mid-1990s have been noteworthy. Despite the party’s philosophy supporting smaller, decentralized government, and the fact that four of the past five presidents have been governors, the current and future configurations of FED, IGR, and IGM are likely to be shaped far more in Washington, DC than in the state capitols, county courthouses, or city and town halls.

Space does not permit elaboration of our broader argument as well as of the politics–finances link. Four examples will suffice as illustrative of both themes, however.

1. Mandates

The first involves P.L. 104-4, the Unfunded Mandates Reform Act of 1995 (UMRA). This legislation passed in March 1995 by votes of 91–9 in the Senate and 394–28 in the House. It was aimed at reducing the compulsory coercive costs borne by state and local governments as a consequence of national mandates contained in congressional statutes and administrative rules and regulations (Posner 1997, 1998). Prior to 1980 the ACIR had identified a total of 36 federal unfunded mandates; but the 1980s alone added 25 more to the statute books (ACIR 1993). The most galling aspect of these actions for state and local officials was the absence of compensatory money accompanying these mandates. In fact, if federal pass-through aid to individuals is excluded, the real federal value of federal aid (to places) declined by 33% between 1980 and 1990 (Conlan et al. 1995).

This fiscal squeeze made it understandable why state and local officials labeled unfunded mandates as fiscal terrorism, silent subversion, and the undeclared war. A small indication of the

fiscal magnitude of unfunded mandates came from a 1990 EPA report. It estimated that federal pollution requirements cost local governments \$19 billion from 1970 to 1987 with a projected cost increase to \$32 billion in the year 2000 (Conlan et al. 1995). Unfunded mandates, of course, are only one form of coercive IGR. Another coercive mechanism is preemption (Conlan 1991; Zimmerman 1991). The use of these two (and other) coercive instruments reflected, in the 1990s, the “regulatory federalism” shift noted by Elazar in the 1980s (Elazar 1984, 252).

Mandate reform was a key plank in the Republican Party’s Contract with America in the 1994 election campaign. A further (but imperfect) indicator of the priority attached to the unfunded mandate issue was the bill numbers of the mandate legislation, S. 1 and H.R. 5, in the 104th Congress. With strong support from the Big Seven Public Interest Groups, the unfunded mandate reform legislation became law and was hailed as a significant victory (Posner 1997, 1998). UMRA has been considered helpful in bringing to the attention of Congress the anticipated compliance costs of proposed legislation, and invoking a point of order procedural threat to halt action on mandates imposing \$50 million or more of direct uncompensated annual costs on states and localities. This victory, however, was compromised by significant omissions from coverage under the act, such as exemptions of regulations dealing with Constitutional rights, anti-discrimination, grant conditions, national emergencies, and preemptions, as well as all pre-1995 mandates. Nor does the act deal with the cumulative financial impacts of mandates below the threshold on states and localities. A senior staff member of the General Accounting Office (renamed the Government Accountability Office) described UMRA as a “stop, look, and listen” approach to mandate restraint (Posner 1997, 53). A Congressional Budget Office study found that, over seven years since UMRA’s passage, mandates in only 42 out of 4097 bills exceeded the threshold, or 1%, while the remainder was exempt from it (Kettl 2003, 12). According to a close observer, federal agencies are “... just not obeying the law ... so they’re not making the estimates of how much it is going to cost states to comply” (Clewett 2003, 7).

2. No Child Left Behind

The second illustration is the No Child Left Behind Act of 2001 (NCLB), signed by President Bush on January 8, 2002 (P.L. 107-110). It greatly expanded the national role in public education, historically a predominantly local and state responsibility, and changed the emphasis toward accountability for results. The NCLB built on the 1994 Goals 2000: Educate America Act, signed by President Clinton, which codified national goals for elementary/secondary education and emphasized standards-based improvement for all children. More than just a reauthorization of the Elementary and Secondary Education Act of 1965 (ESEA), NCLB shifted the national government’s role of targeting student groups (or areas of need) to drive general improvement of public education. Strategically, ESEA’s distributive, stimulating, and supplementary approach to grants was replaced by a performance-based and penalty-laden system. The bills passed by 81–10 margins in the Senate and 381–41 in the House, with obvious strong bipartisan support.

In exchange for nearly a 25% increase in federal aid (more than \$4.3 billion the first year), under NCLB, states must be more accountable for results and develop plans to ensure that no child will be left behind or, as one author put it: “No Child Left Untested,” “No Teachers Left Teaching” (Wright 2003, 229). Nearly all children in grades 3 through 8 must be tested and assessed each year in reading and math. Other federal mandates require states to collect and disseminate results of tests, ensure that every classroom has a “highly qualified” teacher (as indicated by having a degree in their field and passing a state test), hold school leadership accountable for performance, establish standards and conduct assessments for science progress, and guarantee that all students achieve a “proficient” education level by the 2014–2015 school year through attaining annual benchmarks. A particularly controversial provision of the law is that schools where only one subgroup of students—such as special education students or students not proficient in English—fail to reach annual improvement targets and are labeled “needs improvement.” This stigma is assigned even

though all other categories of students attain “adequate yearly progress” (AYP) targets. Where a school’s students are failing to make the AYP grade, states may arrange for students to transfer to a higher-achieving school, replace local school personnel, turn operations over to the state education agency, extend the school day or year, make curriculum changes, require tutoring, and reopen the school as a charter school (run by teachers independent from the local school system) or place it under private management.

Testing students has long been a fundamental component of K-12 education, but under NCLB the stakes have been raised enormously. Critics claim that a one-size-fits-all Texas model has been imposed over existing state testing systems. A National Education Association policy analyst (Pons) characterized the AYP: “It’s the equivalent of saying every kid should be three feet six when they’re in fourth grade” (Andrade 2004, 14).

Other criticisms, concerns, and complications abound. Samples include the following: teachers will be encouraged to teach to the test and emphasize math and science, instead of using a broad well-rounded curriculum; teachers will practice grade inflation and schools will lower standards and “game” AYP targets; schools will treat high- and low-performing students in the same manner; schools that are already performing at high levels will have difficulties showing substantial improvement; and parents will be unable to find suitable alternatives to under-performing schools.

Even with this infusion of new monies, federal funds will still account for only about 10% of total spending on elementary and secondary education. Yet governors and legislators have been reluctant to turn down funds despite the accompanying stringent—and not fully funded—testing and other mandates that generate an estimated additional \$35 billion in new costs above the \$29 billion annual congressional appropriation. Nevertheless, and somewhat surprisingly, an on-going study by the Education Commission of the States indicated that by March 2003 states were making “significant progress” and were generally “on track” implementing the spirit and requirements of NCLB (Decesare 2003, 14–15). However, in view of the growing national deficit, by 2004, state and local officials were increasingly skeptical of prospects for continued substantial increases in federal education spending under NCLB. A study by the National Conference of State Legislatures found appropriations for NCLB in 2004 to be \$9.6 billion below the amounts authorized for mandated state actions (Stauffer and Tubbesing 2004, 22).

3. Homeland Security

A third example of the contemporary scene is the Department of Homeland Security (DHS) legislation signed by President Bush on November 25, 2002 (P.L. 107-296). The new Cabinet level department represents the most extensive reorganization since creation of the Department of Defense in 1947, involving programs of some 22 federal agencies (Kettl 2004). The mission of DHS is to bolster national capacity in intelligence and warning, border and transportation security, domestic counter-terrorism, critical infrastructure protection, defense against catastrophic terrorism, and emergency preparedness and response. According to the Bush Administration’s National Strategy for Homeland Security, state and local governments play primary responsibilities in “funding, preparing, and operating the emergency services that would respond in the event of a terrorist attack” (Krane 2002, 4). An Office of State and Local Coordination was created in the Office of the Secretary to link IGR roles and responsibilities.

In the post-September 11 environment both local and state government spending for security has expanded considerably on their own initiative as well as pursuant to federal mandates and incentives. In addition to making improvements and adding safeguards in transportation, communications, public health, and drinking water infrastructure systems to reduce vulnerabilities, under the USA Patriot Act of 2002 (P.L. 107-56) states and localities are required to collect and disseminate information on the status of immigrants, international students, and driving license applications.

Financial help from Washington, DC has been slow in arriving. Historically, the major sources of assistance to states and localities were the Federal Emergency Management Agency, the Public

Health Service, and the Justice Department's Office of Defense Preparedness (ODP). A new source is the Bush administration's First Responder State/Local Preparedness Grant, totaling about \$3.5 billion annually. Funds are available for communications improvements, first response unit support, and training activities and other related purposes. States must prepare a plan, approved by ODP, with strategies for dealing with threats, vulnerabilities, and capabilities. The legislation mandated that states pass-through 75% of their allocation to local governments, with the remainder for use at the states' discretion on such activities as coordinating drivers license standards, terrorism insurance marketing, and money laundering suppression. States also received \$1 billion for Public Health Grants for Bioterrorism Preparedness. In the fiscal year 2003–2004 budgets, grants accounted for about 10% of the total homeland security appropriation, far less than state and local leaders claim they need.

Although considerable attention has been given to the advantages of a centralized department, the homeland security system remains fragmented at the national level. For example, 23 federal grants available for first responders, amounting to \$20–\$22 billion, are administered by three different national agencies (National Academy of Public Administration 2004, 15). Overlap and duplication are apparent, such as in the existence of 16 training grants. Eligible recipients differ, definitions of "first responder" are inconsistent, funds are both targeted and untargeted, some programs are direct national–local and others are channeled through state agencies, and requirements such as matching and maintenance of effort vary from program-to-program (General Accounting Office 2002).

This fragmentation is superimposed over a historically decentralized system. For example, homeland (local) security in the Seattle, Washington area involves coordinating the efforts of 115 signatories to the regional disaster plan, including cities, fire districts, school districts, water and sewer districts, numerous hospitals, and the Port of Seattle (Stenberg 2004, 7). In his analysis of New York's response on September 11, Kettl noted the fundamental coordination challenge raised by Gulick in 1937: "It required the linkage of strong, functionally organized bureaucracies to solve a place-based problem" (Kettl 2004, 69).

At the sub-state regional level, the need for better IGR and IGM communications and coordination has provided a new and potentially valuable role for councils of governments. Yet the "coordination challenge" will severely test their capacity to achieve inter-jurisdictional collaboration. In the aftermath of September 11, there was confusion about who was or should be responsible for functions like airport and port security, protection of possible targets like nuclear power plants and local water systems, routine traffic stops, and bioterrorist attack prevention. There also was little consensus on who should pay for these additional measures. Information sharing about emergency preparedness, suspects, and potential threats was problematic, both among federal agencies and throughout the intergovernmental system. Trust and partnership were often lacking between states and localities, between sub-national and national agencies, and among federal agencies (Wise and Nader 2002). In GAO's judgment, "the federal government will need to effectively respond to significant management and coordination challenges if it is to provide ... leadership and be successful in preventing and responding to any future acts of terrorism" (General Accounting Office 2002, 1). A panel of the National Academy of Public Administration observed: "Fitting this intergovernmental system together coherently will not be easy" (National Academy of Public Administration 2004, 9).

4. Internet Taxation

The fourth example involves the broad domain and overlapping conditions where state taxes impinge on interstate commerce. The Internet Tax Freedom Act, which Congress passed in 1999 (P.L. 105-277), placed a temporary (three-year) moratorium on new state and local telecommunications taxes and prohibition on applying existing utility or gross receipts taxes to access to the Internet, such as franchise and subscription fees for high speed lines or cable-modem service. The

ban expired in November 2003. Collection of taxes on mail order sales from remote sellers not having a physical presence in a state was a related aspect of this issue that reached the US Supreme Court in 1967 and 1992 (*National Bellas Hess, Inc. v Department of Revenue* and *Quill v North Dakota*) and had remained a problem since, with taxes rarely being collected. While Congress did not prohibit sales taxes on Internet purchases, collection was impeded by a national requirement that both the buyer and seller must have a physical presence in the state where the buyer resides (Powell 2000).

The Big seven public interest groups, together with organizations representing state and local tax officials, vigorously opposed the 1999 preemption and later legislation. They claimed that not taxing Internet transactions gave an unfair advantage over traditional retail business enterprises operating within a state. The tax avoidance/evasion deprived state and local governments of significant sales tax revenues. One study estimated total state and local government yearly revenue losses from e-commerce on all sales over the Internet to be \$15.5 billion in FY 2003, growing to between \$21.5 billion and \$33.7 billion by 2008 (Bruce and Fox 2004). The losses represent from 2.6 to 9.9% of total state tax collections over this time period.

In April 2003, the temporary moratorium was extended for two years to give state and local leaders an opportunity to address issues associated with telecommunications taxation. One of the key concerns of Congress was the confusing array of 7500 jurisdictions levying state and local sales and use taxes dating from the 1930s. The National Governors Association and others argued that a uniform state sales tax on Internet transactions would be equitable for all parties and eliminate the need for continuation of the moratorium. By the end of 2003, over thirty states had signed the Streamlined Sales and Use Tax Agreement. This provided for model legislation to modernize, simplify, and unify state and local tax code language, administrative systems, and audit processes across the country. The result would be greatly reduced compliance and collection burdens on remote sellers. The collaborative project that gave rise to the agreement was an example of how interstate cooperation, prodded by a looming national prohibition or preemption, can successfully address national issues without the intervention of Congress. Nevertheless, in 2004 Congress passed the Internet Tax Nondiscrimination Act (P.L. 108-435) extending the prohibition on taxing Internet access to November 1, 2007.

In summary, these four programs illustrate the mixed signals being sent from Washington, DC to state and local officials at the turn of the century. On the positive side, President Bush sought to give states more discretion and flexibility by proposing the consolidation of a number of categorical programs into block grants, including Medicaid, low-income housing, Head Start, and child welfare. In 2003, the Bush administration and Congress provided \$20 billion in unrestricted federal aid to help compensate states for lost revenues attributed to federal tax cuts. By 2004, total federal aid had reached nearly \$400 billion, a record level in terms of overall magnitude, percentage of gross domestic product (3.6%), and percentage of federal spending (18%). In addition, the Supreme Court under Chief Justice William Rehnquist had taken a pro-state persona in decisions in federalism cases (often by a 5–4 majority) that restrained federal authority in prohibiting Indian tribes suing states in federal court to force negotiations over casino gambling on reservations and state personnel suing their employer alleging age discrimination. The Court also took a narrow view of the interstate commerce and the necessary and proper powers. It reasserted Tenth Amendment significance in striking down congressional laws banning sodomy, those requiring local gun-free school zones, state disposal of low-level radioactive waste within their borders, and local law enforcement agencies conducting background checks on handgun purchasers (Kincaid 2001 Pickering and Clayton 2004).

The Supreme Court's decisions reflect the pro-state philosophies of its Republican appointees, as well as the growing proficiency of state attorneys general as litigators before the Court and their increasing willingness to file amicus curiae briefs in behalf of state interests. As one analyst of federalism case litigation concluded: "As a group, the states are more capable Supreme Court litigators, and they win more often." Hence, their participation in cases before the Court "... is a

function not only of necessity, but also a strategic calculation that state concerns will receive a positive response within this policy arena combined with an increased ability to take advantage of this arrangement” (Waltenburg and Swinford 1999, 55, 58).

States also acted on their own by confronting or outflanking national authorities where they believed national officials were acting too slowly or contrary to state interests (Provost 2003). Led State attorneys general have been particularly active by forcing major tobacco companies to agree to make \$250 billion in compensatory payments for the costs of treating tobacco-related illnesses under state Medicaid programs. They also led opposition to high-cost prescription drugs. States have challenged efforts by the Bush administration to weaken air quality regulations, criticized the Environmental Protection Agency (EPA) for moving slowly in regulating, interstate emissions from coal-fired power plants, and sued EPA for failing to regulate emissions of carbon dioxide. Stung by state retirement system losses in the Enron scandal, the attorneys general led an investigation of fraudulent practices in the securities industry when national officials hesitated to move against dubious and/or illegal Wall Street practices.

Offsetting these positive fiscal, judicial, and legal developments, the widening federal deficit raised fears that grants-in-aid, the most discretionary sector of the federal budget, would be targeted for reduction to help pay defense and homeland security costs and cover entitlement program expenditures. While the block grant proposals would bring welcome discretion, they would be accompanied by caps on or cuts in federal aid. The NGA’s executive director (Scheppach) summarized the aid/discretion issue: “Historically, the way they have cut is to offer more flexibility in exchange for less money” (Greenblatt 2004, 86; Posner and Wrightson 1996). Despite UMRA, unfunded and partially funded mandates accompanied each of the Bush block grant programs. Perhaps most disconcerting was the president’s proposal in the 2005 budget to eliminate or curtail 128 grant programs. These were identified in an OMB assessment as not demonstrating positive results or being duplicative.

These mixed signals reflect what one of the authors has described as the “coercive-collage” phase of IGR evolution. The coercive features are evident in continued federal preemptions, mandates, grant conditions, and the “consolidate, cap, and cut” strategy of the Bush administration. The collage features are apparent in the complex and confusing dynamics of centralization–decentralization, flexibility–accountability, diversity–uniformity, and vertical–horizontal coordination shown in the above examples.

Reconciling these points of tension could lead to a new phase of IGR, contingent collaboration, emphasizing the need for officials at all levels to be more anticipatory and adaptive in responding to uncertain and unpredictable events. To do so will call for new networks and partnerships spanning across governmental and sectoral boundaries and require facilitative rather than command-control leadership styles. The challenges of contingent collaboration place a premium on a willingness to work outside of bureaucratic frameworks and engage citizens, non-governmental organizations, and the private sector in meeting a wide range of governance issues (Wright 2003). In his examination of homeland security, Kettl provides an excellent example of these challenges: “... coordination is a *contingent* problem, and what works best depends on the problem to be solved. What it is, how it works, and how best to create the solution depends on the nature of the issue, the nature of the organization, and the nature of its employees. Structures rarely adapt easily enough and quickly enough to meet the challenges that hard problems present. So the very strategies deployed to improve coordination often become the targets for critics when problems occur—and so the bureaucrats and managers seek to reorganize yet again” (Kettl 2004, 68).

C. THE ADMINISTRATIVE DIMENSION

We have devoted considerable space in this concluding section to political and fiscal themes and their interrelationship(s) insofar as they impact on FED, IGR, and IGM. It is not inaccurate or

inappropriate to emphasize these foundation factors, together with constitutional–legal features, as central variables in shaping the dynamics of our multi-jurisdictional systems of governance. To these three elements, which have been extensively noted and elaborated in this essay, we add a fourth and final element. This is the *administrative* (managerial and bureaucratic) dimension woven into the fabric of this analysis.

The twentieth century recorded and confirmed in the United States the rise, prominence, and even selective dominance of the “administrative state” (Mosher 1968; Redford 1969; Skowronek 1982; Waldo 1948). There is, of course, no small amount of controversy associated with the constitutional base, legitimacy, and representativeness of that administrative state (Krislov and Rosenbloom 1981; Rohr 1986; Stillman 1991).

The issues associated with the development and status of the administrative state need not and cannot be addressed here. What is noteworthy, however, are the various features of the American administrative state that became more evident as the concepts of IGR and IGM originated, emerged, and matured. Indeed, IGR and IGM have served as concepts that have enabled scholars and practitioners alike to identify and analyze events and actor interactions more systematically. Three distinctive features have emerged from the application of these concepts and analyses.

The first feature associated with American administration is its fragmentation among thousands of governmental jurisdictions. This dispersion and diversity is a given when effective administrative action is expected (Jennings and Krane 1994; Jennings and Zank 1993). This allocation of authority and responsibility among different governmental entities is sometimes called *horizontal fragmentation*.

One label for the second feature of American administration is *functionalism*. This refers to the high degree of specialization and professionalism that has evolved in the course of creating, expanding, and delivering public services in the United States. This functionalism, of course, is a form of fragmentation. But it is programmatic or professionally based in contrast to the jurisdictionally based fragmentation noted above (Choi, Cho, and Wright 2004). This functional fragmentation was noted and challenged in the 1950s and received classic articulation in the 1960s as “picket-fence federalism” (Sanford 1967). This vertical functional focus and the multiple strategies to cope with it that gave rise in the 1970s to the concept of IGM.

The third and final administrative feature to emerge and wend its way through this essay is a reformist one, namely, the need to create a better bridge and balance between jurisdictional (horizontal) fragmentation and functional (vertical) fragmentation. There is a fundamental tension between the two (Fesler 1949, 1973). The former emphasizes separation of responsibilities and accountability by unit, level, or plane of government. The latter tends toward the fusion or condensation of tasks into a singular functional, often hierarchical, framework. The task of the public administrator specifically, and public officials in general, is to resolve these tensions in a responsive and responsible way.

These features are especially significant when considered in the context of *globalization*. This single word stands for a constellation of international and trans-governmental forces that have altered the cultural, demographic, economic, social, and political character of countries and communities (Jun and Wright 1996). The blurring of jurisdictional boundary lines has challenged us to think in terms of global–regional–neighborhood instead of national–state–local relationships (Peirce et al. 1993). Terms such as “intermestic,” “perforated sovereignties,” “six-pack surprise,” and “globalizing the local community” have appeared as ways to express the penetration of international influences at the sub-national and micro-community levels (Brown and Fry 1993; Hobbs 1994). One possible consequence of these developments is that cultural, economic, and other issues will overwhelm management problems and processes as objects worthy of primary attention on the public agenda.

The resolution of such tensions and challenges hinges on the capacity and ability to use power(s) in constructive ways. We have already noted that Friedrich (1950) called bureaucracy “the core of modern government.” How constitutional, political, and fiscal powers relate to this

“core” is likely to shape the character of American public administration well into the twenty-first century. Only a retrospective view on FED, IGR, and IGM some years hence will provide a clearer picture of how the features of the administrative landscape fit into the hills, valleys, and plateaus of constitutional, political, and fiscal terrains.

Any student of or participant in American government quickly understands that it is distinctive in at least three ways: our constitutional system incorporates separation of powers, judicial review, and federalism. All three were manifestations of the founders' concern that power be divided and so limited. Oddly enough, they did not include in the constitution they were drafting any specifics about the three special features they were writing into it. What they intended as far as separation of powers goes can only be gleaned by ex post facto analysis of the multiple relationships implicit in the first three articles of the Constitution. And although judicial review has a taproot in the Supremacy Clause (Article VI, Section 2), its fuller exposition waited for Alexander Hamilton in *Federalist* No. 78 and John Marshall in *Marbury v. Madison* and *McCulloch v. Maryland*.

It is much the same with federalism. The founders came to Philadelphia to deal, in Hamilton's words, with the "risk of our independence" they believed to stem from "the dangers of ... the evils of a precarious Union" (Hamilton 1850). The continuation of that union, which had been formalized in the Articles of Confederation, was taken for granted. What was needed, as they saw it, were alterations in the role and power of the central government—and so inevitably in those of the states which together constituted the union. "It is indispensable to the happiness of the individual States," George Washington wrote to Chancellor Robert Livingstone of New York, "that there should be lodged some where a Supreme Power, to regulate and govern the general Concerns of the

* This chapter is a revised version of an essay authored by Richard H. Leach (now deceased) and published in 1998 in the second edition of this Handbook. It is a privilege to have been asked to update Prof. Leach's original contribution. Much of this new version retains his line of reasoning and his language. A long time faculty member in the Dept. of Political Science at Duke University, Richard Leach established a reputation as one of the most insightful students of federalism, and his book *American Federalism* is a classic on the subject.

confederated Republic” (Mason and Leach 1981). It was to that end that the national power-oriented Virginia Plan was put forward, which in turn provoked the New Jersey Plan, which saw as a way of preserving the union a constitution limiting national power in favor of the states. If this suggests that the ensuing debate seeking to reconcile the two plans illuminated the founders’ understanding of what the final product would mean in terms of federalism, in fact it did not. Debate focused on the specifics of establishing the various organs of the national government and never touched what they considered to be the nature of the relationship between the strengthened central government and the several states. Thus, as is the case with separation of powers and judicial review, neither the theoretical nor the operational underpinnings of federalism were adumbrated by the founders.

But the lack of a defining conception of federalism at the outset did not mean that no attention was paid to the direction it should take. Debate began immediately, and has continued ever since, on what the Constitution implies as to federalism. The purpose of this writing, indeed, is to attempt to capture the essence of the main directive thrusts in the thinking about federalism that have developed over the more than 200 years of American history since the framing of the Constitution.

The literature on federalism is voluminous and is still growing. If it is agreed that federalism is a way of distributing power among one central or national government (usually called the federal government) and the governments of the smaller jurisdictions into which the country is divided, states or provinces and myriad local government units, all of which levels of government operate directly on the people on the basis of constitutional allocations of authority, agreement on much else remains elusive. That at least five differing conceptions of federalism can be identified is proof of the divergence of opinion that has marked the subject. Those five approaches, briefly, are:

- *Constitutional federalism*: the indeterminate sharing of power among the national government and the states and their local governments.
- *States’ rights federalism*: the sharing of power only up to certain barriers protecting the states.
- *Administrative federalism*: the everyday sharing of power on varying partnership bases.
- *Centralized federalism*: the sharing of power with the goals and procedures of the national government dictating implementation.
- *New federalism*: the sharing of power on the basis of defined national and state functions.

Each of these approaches will now be described briefly.

I. CONSTITUTIONAL FEDERALISM

As already noted, our founding fathers did not elaborate on the federal system they put into operation. But if the founders collectively failed to expound on federalism at Philadelphia, two of them tried to remedy the situation almost immediately thereafter. In several of *The Federalist Papers* (Federalist 1981), Alexander Hamilton and James Madison expatiated here and there on federalism in their extensive commentary on the Constitution, which was just then being considered by ratifying conventions in several states.

Thus Hamilton, in *Federalist* No. 15, echoed founder James Wilson’s conclusion that the specific declaration in the preamble of the Constitution that it is an emanation of the people rendered state sovereignty, the basis of the Articles of Confederation, no longer possible. It was the people, Hamilton declared in *Federalist* No. 9, who had endowed the national government with vastly increased powers, and it was the people who had ordained “a consolidated system,” a “Union under one government” and the “perfect subordination [of the states] to the general authority of the Union.”

But as Wills (1982) has pointed out, all three authors of *The Federalist Papers*—Hamilton, Madison, and Jay—had to convince those opposed to ratifying the Constitution—and there were many such anti-Federalists—“that the subordination of the states [to the proposed energized national government] would not lead to their obliteration. So as a kind of sweet talk, Hamilton referred ... to *partial* incorporation or consolidation” of the states into the revised union. In *Federalist* No. 32, Hamilton argued that:

an intire consolidation of the States into one complete national sovereignty would imply an intire subordination of the parts, and whatever powers might remain in them would be altogether dependent on the general will [of the people]. But ... the plan of the Convention aims only at a partial Union or consolidation ...

As Wills reminds us, however, if Hamilton was for centralization of power, “decentralization existed at the time [and] that was what [he] was fighting.” Thus he had to “reassure people that ... ‘consolidation’ would not mean complete homogenization” (Wills 1982), which Hamilton attempted to do in *Federalist* No. 9, when he posited that those areas of authority not claimed for the new national government in Article I, Section 8, still remained with the states as a kind of residual or concurrent sovereignty, and in *Federalist* No. 34 where he spoke of the states having “co-equal power with the Union” with regard to the power to tax. In *Federalist* No. 23, he denied that the additional powers granted to the national government were “too extensive for the *objects*” confined to it, “or, in other words, for the management of our *national* interests.” By implication, there were state interests as well that warranted protection.

Madison, though “his basic argument [was] for more power to the central government” (Wills 1982), in *Federalist* No. 39 asserted that the states would not be “consolidated into one nation” but would retain authority “within their respective spheres”; in *Federalist* No. 43 he spoke of “the residuary sovereignty of the States”; and in *Federalist* No. 45 he worried about danger to “the unsacrificed residue” of sovereignty in the states’ possession. The celebrated passage in *Federalist* No. 39 reveals that Madison’s ability to “sweet talk” equaled Hamilton’s:

The proposed Constitution ... is, in strictness neither a national or a federal Constitution, but a composition of both. In its foundation it is federal, not national; in the sources from which the ordinary powers of the government are drawn, it is partly federal and partly national; in the operation of these powers, it is national, not federal; in the extent of them, again, it is federal, not national ... in the authoritative mode of introducing amendments, it is neither wholly federal or wholly national; [and] in ratifying the Constitution, [in which case each state] is considered as a sovereign body, independent of all others, and only to be bound by its own voluntary act ... the ... Constitution will, if established, be a *federal* and not a national Constitution.

Nor did Madison let the matter rest there. In *Federalist* No. 51, where he sought to slay the beast of factions, he praised the new constitution for the way it divided power surrendered to government by the people “between two distinct governments.” What better way to protect the rights of the people: “The different governments will control each other, at the same time that each will be controlled by itself.”

The anti-Federalists were not satisfied with Hamilton’s and Madison’s “sweet talk.” A careful reading of all the substantial anti-Federalist writings at the time of ratification convinced Storing (1981), whose study remains the definitive work on the subject, that while they believed the exigencies of the union in 1787 were not severe enough to justify the extensive changes in the “governmental system suggested by the Constitution,” they did agree “that a union was wanted, that it required an efficient government, and that the Articles of Confederation did not provide such a government.” It was for them a matter of finding some middle ground between the Articles and the proposed Constitution. The stumbling block for them was their almost unanimous fear that power

granted would inevitably become power abused. Thus both the ends of the national government and the powers granted to it to accomplish those ends must somehow be more limited than it appeared to them they were in the draft of the Constitution before them.

Moreover, the anti-Federalists were sure that the Federalists sought to overendow the national government with power so as to make it the instrument of the people for “the pursuit of national riches and glory” (Storing 1981). But the latter were not in their eyes the proper ends of government, especially for America. “You are not to inquire how ... you are to become a great and powerful people,” wrote anti-Federalist Patrick Henry. You are to inquire instead “how your liberties may be secured.” In that inquiry, the anti-Federalists argued, state governments were of central importance, for it was they that had primary responsibility for the happiness of the citizenry, the national government being properly confined to defense, foreign relations, and general commerce. In short, the federal system ought to be one that contained “parallel governments in a kind of balance or tension with one another.” As one anti-Federalist tract (Brutus) put it:

Neither the general government, nor the state governments, ought to be vested with all the powers proper to be exercised for promoting the ends of government. The powers are divided between them—certain ends to be attained by the one, and other certain ends by the other; and these, taken together, include all the ends of good government. This being the case, the conclusion follows, that each should be furnished with the means, to attain the ends, to which they are designed (Storing 1981).

Or, as Storing concluded from a broader perspective based on the generality of anti-Federalist writings, “the Federalists emphasized the primacy of the national component in the [mixed system], while the Anti-Federalists urged the importance of a strict division of power and even something like a divided sovereignty” (Storing 1981).

In the end, the draft Constitution was accepted as proposed, but shortly thereafter an attempt was made to “ensure the continued independence and vigor of the states, which [was] missing from the Constitution” (Storing 1981). The Tenth Amendment, added as a part of the Bill of Rights in 1791, states that “powers not delegated to the United States by the Constitution, nor prohibited by it to the states, are reserved to the states, respectively, or to the people.” In fact, the Tenth Amendment has not offered a satisfactory solution to the problem raised by the anti-Federalists; the inclusion of the last four words have tended to make it an empty statement.

Constitutional federalism, in sum, introduces us to the dancers in the federal reel but does not instruct us or them on the intricacies of their dance.* It avoids facing the ultimate theoretical dilemma of definition and so leaves it to the dancers themselves to improvise, and to us to seek understanding of what is happening on the stage. It may be that it did not matter to many of the founders, who may have thought that they had settled on a compromise, “a more or less temporary arrangement in the course of building a genuine national government” (Storing 1981). In any case, constitutional federalism absolutely bars us from arguing for any particular relationship between national and state power.

II. STATES' RIGHTS FEDERALISM

Although a number of threads tie it to anti-Federalist thought at the time of the nation's founding, the roots of *states' rights* federalism really lie in the Kentucky and Virginia Resolutions of 1798 and 1799, authored by Thomas Jefferson and James Madison, respectively. These resolutions were directed at the Alien and Sedition Acts, enacted by the Federalist-dominated Congress in 1798 in response to a perceived possibility of war with France. They would have allowed among other things the president to order out of the country any aliens he judged to be dangerous to the nation's peace and safety, and would have permitted the punishment by fine and imprisonment of any

* For a contemporary analysis of the argument over federalism, see Ostrom (1991).

persons conspiring against any measure of the national government, impeding the operation of any national law, or uttering any malicious statement against an official of the national government. Although their enforcement was lax and they were soon allowed to expire, their execution in some cases and their very presence on the statute books aroused the wrath of many Americans. What is more, they were alleged to be unconstitutional; none of them, however, was ever tested before the Supreme Court. The legislature of Kentucky, predominantly composed of opponents to the Federalist party which controlled the national government, asked Jefferson to draft a series of resolutions for its consideration. Jefferson was happy to comply with the request, and the set of resolutions he wrote moved swiftly to passage and approval by the state's governor before the end of 1798. They were reaffirmed by the legislature in 1799. The resolutions asserted that:

Whenever the general government assumes undelegated powers, its acts are unauthoritative, void, and of no force; that to this compact [i.e., the Constitution] each State acceded as a State, and is an integral party, its co-States forming, as to itself, the other party; that the government created by this compact was not made the exclusive or final judge of the extent of the powers delegated to itself; ... but that, as in all cases of compact among parties, having no common judge, each party has an equal right to judge for itself, as well of infractions as of the mode and measure of redress (Jefferson 1975).

Madison used stronger language in the resolutions he prepared at the request of the Virginia legislature, which were also passed and approved in 1798. In part, Madison's view was that:

the powers of the Federal Government, as resulting from the compact to which the States [are] parties limited by the plain sense and intention of the instrument constituting that compact, and are no further valid than they are authorized by the grants enumerated in that compact; and ... in case of a deliberate, palpable, and dangerous exercise of ... powers not granted by the said compact, the States which are parties thereto have the right, and are in duty bound, to interpose, for arresting the progress of the evil, and for maintaining within their respective limits the authorities, rights, and liberties appertaining to them (Madison 1884).

What Jefferson and Madison did in the political heat of the moment, in short, was to introduce a novel notion into the discussion of American federalism: namely, that the Constitution was no more than a compact—an agreement or covenant—entered into by the several states, not an instrument of the people as declared in its own preamble. The word compact was not in general use at the time as far as public law was concerned, except with reference to agreements between two or more states. Both Jefferson and Madison would have been familiar with the Potomac River Compact that was concluded between Virginia and Maryland in 1785 and still in force as they wrote. In that usage, to be sure, the party states, having drawn up and accepted a compact, retained the right to abrogate it. But to carry the idea to the broader context of the Constitution was bizarre, as the lack of support in other states for the resolutions suggests.

More importantly, what Jefferson and especially Madison advocated was state action—interposition and nullification—in protest of alleged violations of the compact by its creation, the national government. Interposition involves the state placing itself “between the citizens and the national government so as to prevent the enforcement of national law upon [them]. According to this doctrine, each state may be the judge of the legality or constitutionality of national action and may ‘interpose’ its sovereignty to nullify federal action” (Plano and Greenberg 1985). The object of doing so would be to protect states’ rights, rights to the unspecified area of authority left to them in the Constitution after the delegation of powers to the national government and the denial of powers to both national and state governments. Perhaps surprisingly, neither Jefferson nor Madison made reference to the Tenth Amendment as the protector of states’ rights.

If the Kentucky and Virginia Resolutions were less than important in their own day, the novel ideas in them have been drawn on since, as the concept of states’ right they spawned came into

maturity. Jefferson and Madison were supplemented later by John C. Calhoun, as he argued his case for the protection of pre-Civil War southern sectionalism; by those a century later who saw in the Supreme Court's rulings on desegregation, the Commerce Clause, and state sedition laws a usurpation of state authority; and by others who saw in federal laws and regulations providing grants-in-aid to the states an element of unauthorized coercion. To many in the states' rights fold, the 10th Amendment had said it all.

States' rights federalism continues to live on. References to "resurgent states" or to the "primary role of the states in domestic policy" often are euphemisms for a state-centered view (Walker 2000, 27). The Republican party, in particular, has actively sought to instill states' rights theory into policy initiatives as exemplified by the 1994 Contract With America. Furthermore, conservative think tanks allied with the Republican party have published philosophical defenses of states' rights and have called for a constitutional convention on federalism with the objective, among others, of reviving the Tenth Amendment (Seay and Smith 1996). More specific attempts to limit federal government preemption of state or local authority include the Tenth Amendment Enforcement Act (S. 1629, 104th Cong. (1996)) and the Federalism Accountability Act (S. 1214, 106th Cong. (1999)). Both bills failed to win passage, but some provisions related to expediting waiver requests by the states were incorporated into Executive Order 13132 (4 August 1999) issued by the Clinton Administration.

The real enemy of the states' righters has been, from the beginning, the doctrine of implied powers; the national government has repeatedly relied on this doctrine to breach the compact between the states by entering willfully into the states' reserved domain. The states' righters believe a halt must be called to that encroachment. As they see it, state powers can be clearly identified as such, and once this has been done, presumably on a case-by-case basis through the threat of interposition and nullification, the state domain should be fenced off from the national Leviathan. If some states' righters see their role as chiefly one of protest, others interpret it as calling for a declaration of war, particularly on the role the Supreme Court has come to play in the federal system, "for the interpositionists hold that the Court is not to be viewed as the final voice in federal problems because this power ultimately rests in the states operating through Congress or by constitutional amendment" (Macdonald et al. 1957). At least the Civil War ruled out the final stratagem, secession.

But the states' righters have not given up. Although they vehemently attacked the US Supreme Court during the 1950s and 1960s because of the Court's rulings on civil and political rights for non-whites, states' righters have been cheerleaders for the so-called Federalism Five consisting of Justices Rehnquist, Kennedy, O'Connor, Scalia, and Thomas. During the past decade, these five justices have handed down a number of rulings that have begun to erect some fences between state and federal governments. Decisions limiting national authority under the Interstate Commerce Clause, Section 5 of the Fourteenth Amendment, the Eleventh Amendment, and the Tenth Amendment all have been based on the argument that "dual federalism was 'embedded in our constitutional structure'... [and] It upholds the 'dignity' of the states as dual sovereigns" (Kettl 2002). Whether these rulings constitute a federalism revolution is a matter of debate, but there is no doubt that this new line of judicial reasoning in support of states' rights has prompted deep disagreements within the Court as well as in the larger political arena over the nature of the US constitutional system (Clayton and Pickerill 2003; Kettl 2002; Peterson 2003). Confirmation hearings for Justice Roberts and Alito gave little indication of their stances on federalism and it remains an open question as to whether the new Roberts court will try to curb congressional power and favor state governments.

III. ADMINISTRATIVE FEDERALISM

Regardless of the impreciseness of constitutional federalism and the longed for, but not achieved, preciseness of states' rights federalism, those at work on the operating side of the federal system

have from the beginning been establishing yet another view of federalism. The operators of that system—men and women on local councils and commissions, in state legislatures, and in Congress, governors and state and local executive officers, and bureaucrats at all three levels—have not worried very much about articulating a theory of federalism, leaving that to scholars who have had no trouble describing the administrative federalism they saw developing in practice. One of the first of those scholars was Jane Perry Clark, who in her trailblazing *The Rise of a New Federalism: Federal-State Cooperation in the United States* (1938) described and discussed the panoply of formal and informal cooperative mechanisms which had been developed by the time she wrote, mechanisms which linked the national government and those at the state and local levels in a joint effort to provide for the nation's needs. Among those mechanisms, almost all of them developed pragmatically, were informational exchange, loans of personnel, agreements and contracts, joint regulatory arrangements, and grants-in-aid. A later scholar, Daniel Elazar, related in his monumental *The American Partnership* (1962) how from the very beginning of the Republic all levels of government in the United States had collaborated in performing governmental functions. By 1962 Elazar could point to intergovernmental collaboration as “actually the norm” in American political life and in American federalism.

For as Elazar and others made clear, the facts showed that far from comprising separate and independent spheres of authority—“collateral political spheres” in the words of an early states’ righter (Taylor 1820)—federalism necessarily implies cooperation, a blending of governmental efforts in a skein of intergovernmental relations for the furtherance of the public welfare. As Morton Grodzins so eloquently put it, the federal system in the operation of government programs resembles a “rainbow or marble cake, characterized by an inseparable mingling of differently colored ingredients, the colors appearing in vertical and diagonal strands and unexpected swirls. As colors are mixed in the marble cake, so functions are mixed in the American federal system” (Grodzins 1960).

In short, administrative federalism posits a single mechanism of government for the United States, with many centers of action, which between them are to perform all the functions required of government by the American people. Even before the Philadelphia Convention, intergovernmental cooperation was being utilized in a number of functional areas, and the founders were so conscious of “the essential unity of state and federal financial systems” that they provided for the assumption by the national government of the Revolutionary War debts of the states (Grodzins 1960). If they did not say so explicitly, the founders understood that the national government would act in harmony with state and local government programs and policies. During the nineteenth century that understanding was manifest in a steadily increasing intergovernmental cooperation in all the important functional areas of American government that continued through the twentieth century. Thus administrative federalism can be read as cooperative federalism, in that it accepts and operates on the principle that shared programs, without too much regard for neat allocations of responsibility, form the core of American governmental operation, and so of federalism as well.

Intergovernmental relations (IGR)—that is, intergovernmental cooperation—rather than the required priority of one or another level of government, is the working principle of the federal system and is not confined to relations between the national government and the states. IGR also includes relations between (a) the national government and local units of government, (b) two or more states, (c) each state and its own subordinate governments, and (d) two or more governments at the local level. The complex and diverse jurisdictional variation typical of American federalism creates an organizational and functional fragmentation across levels of government which in turn produces equally complex and diverse patterns of administration among and between units of government. The critical challenge, of course, is the production and delivery of public services with reasonable effectiveness and efficiency in a fragmented system that is not hospitable to integration, but is constrained by interjurisdictional dependency. “Consequently, IGR is generally characterized by reciprocal activity and interdependent choices among multiple governmental units and political interests” (Krane and Wright 1998).

The fullest exposition of the concept may be found in the study of Deil S. Wright (1988) in his *Understanding Intergovernmental Relations*. Wright identifies five important dimensions of IGR: (1) the number and types of governmental units, their legal status, and changes over time; (2) the number and types of public officials by jurisdiction and unit, their backgrounds and training, the attitudes and perceptions of their roles and responsibilities, and the actions they normally pursue; (3) the patterns of interaction among and between officials representing various jurisdictions and governmental units; (4) the range of involvement by all public officials—elected and appointed, national and local, executive, legislative, and judicial—especially in the formulation of policies and programs that have impact on more than one unit; and (5) the policies and programs implemented through intergovernmental arrangements with particular concerns about administrative discretion by official and by unit, control over and flow of fiscal resources, and differential effects of policies and programs delivered via different intergovernmental routes. These five dimensions must be understood against the distribution of authority and power which is diffused in the United States. Because “the spheres of autonomous action lack precise definition” (Anton 1989), administrative activity succeeds only if a “working partnership” prevails (Elazar 1972).

Furthermore, these partnerships need not be restricted to relations between governments only. The so-called creative federalism, briefly in vogue in the 1960s and 1970s but now experiencing a revival, was a logical extension of administrative federalism. The phrase was first used and the concept described by Governor Nelson A. Rockefeller of New York in his Godkin Lectures at Harvard University in 1962 (Rockefeller 1962). Later the idea was picked up by President Johnson and made central to his program agenda after his election in 1964. That agenda recognized that private, usually nonprofit, centers of power may appropriately share with governments the job of serving the American people. As extended to creative federalism, administrative federalism incorporates the view that when action is needed in attacking the problems facing the nation, a public-private working team may be among the forces at work in certain problem areas, with the national government not necessarily the senior partner.

The ad hoc proliferation of programs designed and funded by the national program but administered primarily by states and localities brought to the fore the question of program performance. As responsibilities became increasingly shared within a network of government jurisdictions, public agencies, nonprofit organizations, and for-profit enterprises, administrative federalism became intersectoral as well as intergovernmental (Musolf and Seidman 1980; Williams 1980). Concerns about the quality of program administration and the cost of services delivered were expressed by government watchdogs such as the Office of Management and Budget (OMB), the Government Accountability Office (GAO), and the Advisory Commission on Intergovernmental Relations (ACIR), as well as by professional associations such as the National Assistance Management Association and the American Society for Public Administration's Section on Intergovernmental Administration and Management. The need for improved coordination and orchestration of many different organizations (public, nonprofit, for-profit) in the implementation partnerships that became characteristic of public programs expanded the work of public managers beyond that of traditional administration—the operation of a bureau—to include the management of an interorganizational network (Gage and Mandell 1990). This shift has been labeled *intergovernmental management* (IGM) to emphasize the management processes inherent in program administration (Marando and Florestano 1990; Wright 1990). But the M in IGM has come to be seen not in terms of top-down hierarchical control, but rather in terms of loosely coupled patterns of interaction and influence that require government officials to rely more on bargaining, negotiation, dispute resolution, informal personal linkages, and trust-building (Agranoff 1986; Agranoff and McGuire 2003; Jennings and Krane 1994).

The concept of administrative federalism, in sum, focuses on those involved in carrying out the service functions required by the American people. For the most part their attention has been devoted from the outset to administering as effectively as possible the functions required of

them, not with theoretical niceties.* Thus they see federalism as a process, as a way of doing things, rather than as a set of abstract principles—remembering always the most basic principle of American political thought, limited government. The most frequently occurring words in their vocabulary are function, program, activity, and administration, in all of which collaborative relations are fundamental. If they think about federalism at all, they see it as a method permitting the accomplishment of commonly held objectives, a method whose virtue lies in what it permits to be accomplished rather than in its adherence to a set of binding tenets.

Just as it cannot be shown that theory informs administrative federalism, so it cannot be demonstrated that it demands a certain pattern of intergovernmental relations be followed. Rather, variation and adaptation to different changing needs have been characteristic of American intergovernmental relations. Each particular type of relationship has been determined by the area of activity and the set of actors involved. In some areas, no clear pattern of intergovernmental relations has evolved. In others, programs have tended to follow fairly well-defined sets of relationships. Seldom is the same pattern followed in two action areas; new varieties of relationships are constantly being developed and put into use.

What Luther Gulick had to say about programs in the area of business regulations and control applies with equal pertinence to the development of intergovernmental relations in other areas. The former, Gulick observed:

did not come about as a matter of social theory. [They] came about because ... problems arose.... The people most affected took what steps they could to establish the controls and the services they found to be needed.... Each move was a pragmatic Yankee solution designed to meet a condition, not a theory (Gulick 1962).

As a result, working federalism—that is, administrative federalism—is marked by diversity, trial and error, and experimentation on the one hand and it is problem-oriented on the other. As new problems are brought under attack by governments, different sets of relationships are established in connection with each. As Walker (1981) put it, what it all amounts to is a “non-system of federal-state-county-city-town-school district-special district-non-profit relationships that comprises the dynamics of ... American federalism.”

IV. CENTRALIZED FEDERALISM

Although *centralized* federalism is primarily a product of the 1960s and 1970s, its roots go back to the first years of the Republic. Alexander Hamilton laid the foundation for it in his contributions to *The Federalist Papers* and in his state papers and actions as Secretary of the Treasury under George Washington. Later John Marshall, in his opinions as Chief Justice of the United States, consistently emphasized national power, stressing that the Constitution emanates from the American people as a whole. It followed then that the government created by the whole people is to be the focal point of governmental power in the United States and that it has the primary responsibility for meeting the needs of the American people. Between them, Hamilton and Marshall made the point that, in Marshall's words in *McCulloch v. Maryland* (1819), the national government “is the government of all, its powers are delegated by all; it represents all, and acts for all... The nation, in those subjects on which it can act, must necessarily bind its component parts.” Among those subjects is the responsibility, to paraphrase Chief Justice Salmon P. Chase in *Texas v. White* (1869) of maintaining not only the national government itself but of preserving the states and maintaining the governments thereof.

* In an early study of the attitudes of governmental officials concerned with the administration of federal grant programs (Subcommittee on Intergovernmental Relations, 1965) it was found that state and local officials were more apt to take a theoretical stand and to be concerned with balance and parity than were federal officials (pp. 95–97, 99).

Basic to the concept of centralized federalism obviously is reliance on the powers specifically delegated to the national government by the Constitution and perhaps less obviously those powers implied from the former through Article I, Section 8, the “necessary and proper” clause. “Broad construction of this clause by the Supreme Court, defining ‘necessary’ as meaning appropriate to the end and not explicitly forbidden, so effectively expanded the range of subjects on which the Congress could act that the Court ... came to see the Tenth Amendment as simply stating a truism” (Reagan and Sanzone 1981). The net effect of such judicial interpretation, which has been pretty consistently followed through the years, has been to permit the national government virtually all the latitude it needs to act when and how it sees fit, at least when it feels that the political consensus of the American people is behind it.

If there were few opportunities at first to put centralized federalism into practice, government as a whole not playing much of a part in Americans’ lives, the Civil War and the two decades following it, Scheiber (1980) concluded, saw a “vast expansion of the policy responsibilities of the national government and an increase in the jurisdiction of the federal courts [underpinning a] significant centralization of real power,” leading him to describe the period as one of “transitional centralization.” From 1890 to 1933, Scheiber (1980) saw a period of “accelerating centralization marked by [s]uccessive federal laws advanc[ing] federal regulation” and the “intensive, if temporary, centralization” required by World War I. This period was characterized by a slow but steady growth in federal grants-in-aid from \$52 million in 1902 to \$596 million in 1927. That new technologies and the emerging national marketplace fueled governmental centralization is exemplified by the rapid rise in federal highway construction aid from none in 1915 to \$92 million in 1922 (Walker 2000).

But it was the crisis caused by the Great Depression and the efforts of the New Deal to fight it that provided the opportunity for centralized federalism to become consolidated. Although the New Deal was not consistent in its policies and programs, it tended to view the national government as the engine to drive the country toward economic recovery and reform, and it continued to hold that view during World War II and afterwards. Looking back at the New Deal era, Leuchtenburg (1963) observed that “Roosevelt and the New Dealers almost revolutionized the agenda of American politics” by shifting the balance of federalism from state capitals to Washington and by making the national government, especially the president, “the focus of all government—the fountainhead of ideas, the initiator of action, the representative of the national interest.” Such action was possible, in part, because many state governments failed to act or were unable to act effectively in attacking the multiple ills caused by the Depression.

Later the Roosevelt view was even more fully implemented. With the end of World War II the federal government embarked on a major expansion of the nation’s physical infrastructure, including an interstate highway system, the Hill-Burton hospital construction program, public housing, and urban development. The recognition of poverty and racial segregation and other dysfunctional social conditions provided the impetus for the creation or enlargement of federal aid programs in economic development, education, environmental protection, law enforcement, medical care, social services, and welfare. Under the rubric of President Johnson’s Great Society, centralization blossomed, until by 1969 James Sundquist could declare that “the American federal system [had] entered a new phase,” a phase marked by “massive federal intervention in community affairs.” Sundquist went on, “Through a series of dramatic enactments the Congress [had] asserted the national interest and authority in a wide range of governmental functions that until then had been the province exclusively or predominantly, of state and local governments” (Sundquist 1969; see also Benson 1941). Again, it is important to note that a wide variety of organized interests demanded national government initiatives because many state governments as late as the mid-1960s were characterized by mismanagement and political corruption (Leach 1970).

The chief tool employed by Congress in doing so was the grant-in-aid, which had begun to be used much earlier. But whereas at the beginning of the 1960s there were only about forty major governmental functions being aided by some billion federal dollars, by the end of the decade there

were about 150 such functions to which some \$24 billion federal dollars were being directed. And the numbers continued to grow. But it was not merely the proliferation of programs and the remarkable increase in the amount of federal funds to underwrite them that marked the centralization thrust of the Great Society. It was, even more importantly, the taking of the initiative by the national government in identifying what the national objectives were to be and in developing the programs thought necessary to achieve them.

Having identified a broad range of programs as being in the national interest and having provided funds to state and local governments to implement them in whole or in part, the national government, through congressional enactments and administrative rules, placed their administration under close federal control. The 1950s push to build up the country's physical plant included, for the first time, requirements that states and localities submit plans as part of their requests for federal aid dollars. This seemingly modest requirement led to rapid growth in the planning profession; this in turn was followed by growth in the evaluation and policy analysis professions as additional federal regulations demanded accountability for the use of federal funds (Krane 2001). Walker (1981) commented on "the many avenues" through which state and local actions were "circumscribed ... by federal statutory and federal court-sanctioned constraints—based on an extraordinarily expansive interpretation of Congress's power to regulate interstate commerce and to spend for the public welfare." It would be a mistake to view the expansion of conditions associated with federal grants-in-aid as solely a bureaucratic product; after all, interest groups pressured Congress and the executive branch to attach rules on federal aid as a means of changing the behavior of state and local officials in areas as diverse as nondiscrimination, environmental and historic protection, access to government information and decision procedures, health, welfare and safety, and general administrative requirements (Walker 2000).

All the foregoing aside, centralized federalism did not crowd the states and their local subdivisions completely off the stage. Certain areas—matters affecting property and business contracts, the law of domestic relations, and the authority of state governments over local governments, for example—were not invaded at all. And despite the ever-widening panoply of nationally conceived and designed programs, the national government, as already suggested, usually worked through state and local governments in the actual administration of those programs. Thus the national bureaucracy remained remarkably stable throughout the period, while those of state and local governments increased enormously. Indeed, it is entirely possible to incorporate cooperative federalism into the concept of centralized federalism, as Vile (1961) concluded when he wrote that "the foremost characteristic of American federalism ... is the *interdependence* of federal and state governments."

Oddly enough, but perhaps not surprisingly, there was little evidence that many, if any, of those most active over time in developing centralized federalism thought in theoretical terms as they proceeded about their business, despite the easy availability of a corpus of theory to turn to. Rather, it appears clear that centralized federalism came about in large part because subnational governments found it easier and more expedient to turn to Uncle Sam for financing: an Uncle Sam who in the 1960s and into the 1970s seemed to be riding the crest of a wave of prosperity and could afford largess to them (and an Uncle Sam who was quickly losing his fear of deficit spending!), instead of meeting program needs out of their own resources. Thus program needs, not theory, propelled the rise of centralized federalism.

National actions from the end of World War II to the late 1970s aimed to overcome differences in life conditions by race, gender, and region as well as to reduce the spillover effects of changes in the economy and living patterns. Federal policies targeted opportunities and resources to populations and places that had not benefited from the explosive economic growth of the period. Similarly, federal actions also sought to establish a national sense of citizenship such that laws and services became more uniform across the fifty states. In this regard, Congressional legislation and US Supreme Court rulings on civil and political rights were crucial.

Political scientist Samuel Beer asserts that centralization was made inevitable by the very nature of the American economy as it came to be after World War II—an economy featuring ever-growing functional differentiation at the hands of professional technocrats, an economy that could only be held together for the overall good by centralized authority. Beer (1983) stressed the centralizing impact of scientific knowledge and of the technology attendant upon it on public policy makers and administrators, all of whom were united across jurisdictional lines in the particular programs or segments thereof in which they could apply their own skills and knowledge. This new professionalism—or “picket fence” federalism to use Wright’s term—Beer (1983) contends, accounts for much of the expansionist public sector politics that marked the mid-decades of the twentieth century and contributed to centralization.

V. NEW FEDERALISM

Like states’ rights federalism, *new* federalism was informed by a theoretical assumption made by President Nixon, who pledged both in campaigning and from the White House to redirect the actions on the federalism stage. A self-conscious conservative philosophically, Nixon was offended by the rise of centralized federalism and the imbalance he believed it produced in governmental power in the United States. He thought a sorting out of governmental roles and responsibilities and a rearrangement of governmental functions was not only possible but was required to bring about a balanced federal system. He found in a set of published writings just the exposition and synthesis he needed to operate from.* Basically, those writings made a case for a degree of decentralization in domestic policy making and program administration to be accompanied by more selective and refined financial assistance from the national government to the states and local governments. The focus of the latter was to be general revenue sharing (GRS), which once in effect would remove most of the strictures on how monies received from the national government could be spent by the recipient subnational governments. If the decentralization of policy making and administration remained confined mostly to rhetoric, GRS became the law of the land in 1972 and remained so until it was phased out in the middle 1980s.

But if GRS had been conceived as a tool of decentralization, it served as such only in part, for it increased the dependency of state (until 1980, when states were dropped from the list of recipient governments) and local governments on federal funding and, since payments went by right (no applications were necessary) to virtually all subnational jurisdictions in the country, it vastly extended the involvement of the national government in state and local program planning and operation.

Nixon and his successor Gerald Ford did not achieve their stated objective of returning domestic policy responsibility back to the states and localities. Instead, national aid as a percentage of state and local government expenditures increased as the federal government moved into functions traditionally associated with subnational governments. An important new direction in federal aid appeared during this period—newer aid programs targeted national funds toward individuals rather than jurisdictions. The bulk of federal dollars was distributed via entitlements for health care, housing, and income maintenance (Anton 1989). An ironic consequence of the federal shift to finance social services was that under new federalism aid to places peaked in 1978 and has declined since then (Kincaid 1999).

The effort to devolve program responsibility begun by Nixon gained new momentum during the Carter and Reagan administrations. Carter, during his one term, sought to deregulate certain sectors of the economy as well as to reduce the rules attached to federal aid. President Reagan, who

* Four papers, written under the pseudonyms of Publius, Cato, Althusius, and Polybius, appeared in *Publius*, 2, 95–146. Another, by Richard P. Nathan, “Federalism and the Shifting Nature of Fiscal Relations,” appeared in *The Annals of the American Academy of Political and Social Science*, 419, 120–129.

campaigning on a platform that claimed “government was the problem” holding back the nation’s progress, proposed an “even newer” new federalism that explicitly rejected cooperative federalism as well as the Nixon commitment to a national obligation to help states and localities pay for programs transferred from the federal government (Krane 1990). His first budget terminated 60 grant-in-aid programs, reduced funds for several entitlement programs, and consolidated 77 grants into 9 new block grants, and as a result, produced “the first absolute reduction in federal aid outlays recorded in decades” (Beam 1984). Many of the Reagan cuts fell on programs for the working poor and this targeting forced state governments to raise their own revenues to make up for the loss of federal dollars.

As Peirce (1984) observed, “When Reagan came to the presidency, his view of federalism was the strongest of any predecessor in decades.” It was his conviction that Washington and the national power it stood for were the enemies both of subnational governments and of the American people and that they must be fought if federalism were to be rebalanced. Reagan (1982) urged a gathering of state legislators, “Together let us restore constitutional government, let us renew and enrich the power and purpose of state and local communities.” Reagan carried his dream of reform further by proposing a swap to give the states full responsibility for welfare programs in return for the national government taking over the costs of Medicaid and the food stamp program, the eventual turnback of certain federal programs to the states, and the creation of a trust fund to be funded partially by the assignment of federal excise taxes to it and partially from general federal revenues, its purpose being to finance the transition from federal to state and local funding. Reactions to these proposals both in Congress and by state leaders was so vehemently negative that little was heard of them subsequently.

Undaunted and still in search of action to exemplify theoretical commitment, the Reagan administration came up with four routes to the restoration of the balance in the federal system deemed desirable, two of which were to significantly alter long-time usages in American federalism. Accepting the conclusions of a study by the ACIR (1980) that the federal grant-in-aid program had become overloaded and needed decongestion, Reaganites made the same call for a sorting out of responsibilities among the various levels of government President Nixon had made earlier. As it turned out, however, it was not politically possible to arrive at any generally accepted, precise allocation of level responsibilities. Devolution was also called for—that is, the substitution of state and local decision making for decision making at the national level, largely through the collapse of a number of categorical grants-in-aid into only a few block grants under which the states were to have more discretion in using the funds made available to them. Congress was not willing to go very far along that route, so not much actual devolution took place. Decongestion and devolution were to be joined by decrementalism and deregulation as routes to the new federalism.

Decrementalism was defined as reducing over time the funding levels of many government programs: simply cutting back on the national government’s share of financing programs and thus forcing state and local governments to either reduce program services proportionately or fill the gap from their own supposedly ample resources. From fiscal 1982 on, administration budgets, lowering the proportion of the federal contribution to most grant-in-aid programs, and eliminating other programs altogether, were generally accepted by Congress, and the passage in 1985 of the Gramm-Rudman-Hollings bill, which mandated decreasing federal budget deficit levels each year until 1991, when a balanced budget was supposed to have been reached, made adherence to decrementalism the law of the land. The effect on state and local government finances was substantial: in 1980 federal grants-in-aid made up nearly 27% of state and local spending, but by 1987 dropped to 19%—a decline in real terms of 34% (Gleason 1988). The combination of devolution and decrementalism led to a defacto sorting out of functional responsibilities between national and state governments (Stenberg 1988) and produced a condition best labeled by John Shannon (1987) as “fend-for-yourself federalism.”

Deregulation was the fourth of the D's proposed by the Reagan administration. It was in response to what were generally seen as overly demanding rules and regulations woven into the specifics of grant programs by Congress and federal administrative departments and agencies which were held to impede state and local governments in the implementation of federal co-funded programs. Executive Order 12291 established a benefit-cost analysis requirement and an OMB review of proposed regulations to slow the growth in federal regulatory burdens. As this increase in presidential oversight was put into place, the Reaganites also terminated the A-95 process of intergovernmental consultation that incorporated states and localities in the notice and review process related to federal grants. However, the Reagan administration abandoned its deregulatory rhetoric and imposed a new round of regulations designed to create uniform national standards on product liability. The intent of these new regulations was to assist corporations who faced compliance with widely varying state government regulations, some of which were more restrictive than national standards. In similar fashion, the Reaganites moved to impose new rules on states and localities in the areas of affirmative action, welfare-to-work programs, and medical care for handicapped infants. Despite its federalism rhetoric, the Reagan administration when "forced to choose between policies supportive of its federalist objectives . . . and those supportive of other presidential priorities . . . , the administration decided to pursue a course that was openly or implicitly contrary to its stated intergovernmental goals" (Conlan 1988).

What is the legacy of Reagan's dream of federalism reform? Alice Rivlin (1992) calls attention to effects beyond the national capital:

Unexpectedly, the Reagan cuts energized state and local governments. The cuts created what Richard Nathan has called "the paradox of devolution." With less federal help, states, and to some extent localities, were forced to strengthen their own capacities and resources to meet the rising social problems of the 1980s. The federal pullback came at a fortunate moment—after two decades that had greatly enhanced states' ability to move into the breach.

David Walker (2000) argues Reagan's attempts to reverse the centralization in American federalism failed:

In short, Reagan's and Congress's impacts on intergovernmental relations from 1981 to 1988 were mildly surgical from a conservative perspective, though drastically so from a liberal vantage point. They constituted more a reaction than a revolution because neither the politics undergirding the earlier public expansionism nor most of the major programs that symbolized that activism were eliminated. To achieve a kind of "defacto," "decremental" federalism in some areas by the drastic device of triple-digit (in billions) budget deficits suggests an approach that does not make sense fiscally or, in the long run, for federalism. No return to dual or even simple cooperative federalism of 1960 occurred. When the regulatory, preemptive, political, and judicial developments of the Reagan years are combined, the net result was a greater centralization in the system . . .

Perhaps the numbers give the best assessment: the rapidly growing costs of health care and income maintenance programs forced the George H. W. Bush administration to reverse course, and by the end of the first Clinton administration, federal aid as a percentage of state and local expenditures reached near-historic high levels.

VI. EVOLVING FEDERALISM

American federalism in the last years of the twentieth century was significantly more centralized than it was at beginning or the middle of that century and the federal government's impact on the lives of US citizens was more extensive and pervasive (Zimmerman 1992). But states and localities also played a much larger role in people's lives. The relationship between national and state

government authority, which is at the heart of any discussion of American federalism, is open-ended and shaped by the larger economic, cultural, and political forces in society. Several influences on how the attributes of US federalism are changing merit comment.

Washington, DC continues to be the principal forum in which important policy directions are established, but the administration of domestic programs has been devolved to the states and localities. Sawicky (1999) points out that “if we exclude Social Security, Medicare, net interest on the federal debt, and defense from the total expenditures of federal, state, and local governments in the United States, 80 percent of what remains is administered by state and local governments.” The movement to downsize government at all levels, as exemplified by the Republican party’s 1994 Contract with America, is perceived by many as a long overdue readjustment of responsibilities between national and state governments. Critics note that this devolution of program responsibility has not stopped with state governments because states have also devolved programmatic responsibilities to local governments. The result is a second order devolution in which states have transferred federal and state program activities along with federal and state regulations to county and city governments, often without the necessary fiscal support or policy authority (National League of Cities 2003). “Squeeze-down federalism,” Jonathan Walters (1996) argues, has relegated to local government “a huge amount of responsibility for some of society’s toughest, costliest, and most thankless jobs...., and the results can be overwhelming.”

The capacity of state and local governments to fend for themselves has been diminished by two important fiscal trends. Citizen revolts against property taxes beginning in California in the late 1970s led state governments to enact restrictions on local property tax rates or growth. By the late 1990s, 37 states had put in place property tax limits (Mackey 1997), and while the reductions in property tax revenues have been partially offset by other sources of revenues (e.g., sales tax, user fees, state aid), many localities struggle financially. The antigovernment stance espoused by Reagan has also found expression in state-imposed limits on local government expenditures. This combination of tax and expenditure limits (TEs) has reduced local autonomy and increased centralization of state and local finances (Saxton et al. 2002). Some states have increased state aid to localities and/or assumed more responsibility for local services (e.g., K-12 education) to replace lost property tax revenues (Fisher 1996), but the ability of state governments to pay for local services has been seriously undermined by the worst shortfall in state revenues since the Great Depression (Lemov 2002). Faced with huge budget deficits, state governments began in 2001 to slash programs and personnel across the board, exhaust state reserve funds, borrow monies, adopt accounting gimmicks, and even raise taxes. Not even sacred cows such as public education or prisons were exempt. Cities and counties soon found state aid drying up, and they were left with even fewer funds as their local sales tax revenues also declined. But the national government has not stepped in to aid states and localities, reflecting in part the legacy of the Reagan administration’s antigovernment policy. Members of the George W. Bush administration, with support from think tanks such as the Heritage Foundation, have argued that “if it is important to shrink the size of the bureaucracy in Washington, it is also important to shrink state government bureaucracy” (Krane 2003). Of course, the lack of federal assistance leaves states and localities with the difficulty of delivering major federal and state programs to citizens, but without sufficient monies to cover the costs. Bruce Katz (2003), an analyst at The Brookings Institution, argues that “it is odd and ahistorical to do nothing for the states and not expect it to hurt the national economy.” Nothing could be more indicative of the fend-for-yourself devolutionary legacy of new federalism than the refusal of federal authorities to bail out the states and localities.

An important foundation of Reagan’s new federalism was the belief, based in normative economic theory, that public provision of goods and services was inherently more inefficient than private provision because governments did not operate in a competitive market (Schlesinger et al. 1986). Efficiencies could be gained, the remedy prescribed, by privatization of government services, primarily through the use of contracts with private enterprise, but also by the divestiture of services (Savas 1982; Tullock 1965). A long history of government contracting for

infrastructure, defense, and administrative supplies has existed, but the more recent movement to downsize the public sector has expanded contracting to areas such as social services where there was little or no previous history. As social service contracting by state and local governments has become more common, the delivery of public programs is characterized increasingly by the use of complex provider networks composed of public agencies (often linked vertically or horizontally), nonprofit organizations, and for-profit enterprises. One important consequence of this shift from a single government agency to a network of diverse organizations is the emergence of *intersectoral administration*. By blurring the boundaries between public, nonprofit, and for-profit sectors in society (Musolf and Seidman 1980), privatization expands administrative federalism by incorporating the intergovernmental management of multi-sectoral networks. Contracted delivery of government services may yield more efficiencies, though the evidence on this claim is still out, but it may also reduce significantly the capacity of public agencies to perform their functions (Milward and Provan 2000), and it definitely poses serious issues of accountability (Romzek and Dubnick 1987).

Not only are the boundaries blurring between public and private sectors, but the boundaries between nations are blurring in regard to the formulation and implementation of public policies. Numerous policy areas are shaped increasingly by decisions made beyond national borders (e.g., international agreements; multinational corporate actions) and these decisions often impose requirements that must be administered locally. Policy issues that result from the interconnections between international and domestic problems have been labeled *intermestic issues* (Manning 1977). Examples encompass the enforcement of international treaties protecting the environment and wildlife, United Nations' agreements on rights for women and for children, the adoption of industrial quality standards, and most recently the imposition of homeland security procedures. Intermestic issues affect federalism because they "constitute a new source of likely IGR tension ... [since] the catalyst causing the conflict can be any one or a combination of different planes of government—international, national, state, local—often located in another country" (Krane and Wright 1998). Whether local industries or local officials wish it, global agreements (e.g., on subsidies or pollutants) can impose unexpected and unwanted mandates that must be enforced.

But intermestic issues are not a one-way street; state and local governments also act internationally. In response to a globalized marketplace, many state and local governments actively promote direct foreign investment, levy taxes on foreign businesses, and even enact regulations requiring ethical and moral actions on the part of other countries or by multinational corporations. The US Constitution's grant of authority in international affairs to the national government has not prevented state and local governments from international involvement (Conlan et al. 2003). What in the past was seen as an inherent power of the federal government is being transformed into a de facto concurrent power.

America's political parties are a product of the nation's federal arrangements and a source of its manner of functioning (Elazar 1972), so how the two parties conceive of federalism and act on their conception critically affects the evolution of federalism. Party positions adopted during the 1950s and 1960s struggle for civil and political rights made federal-state relations an important issue. By 1980 the two parties' perspectives on federalism had diverged to the point that they became a defining aspect of each party's identity. Democrats continued to support a cooperative federalism that relied on a flexible intergovernmental approach to policy problems. Republicans, by contrast, adopted a firm prescription as to how responsibilities between federal and state governments ought to be divided, and they pushed for the creation (or perhaps resurrection) of restraints to insure this division. Stymied by the Democrats' control of Congress, Republican presidents appointed Supreme Court justices who shared the party's federalism vision. The Rehnquist Court's rulings moving away from the New Deal's centralized federalism and giving states some protections from unlimited expansion of federal encroachment, Clayton and Pickerill (2003) argue, are a product of this change in the Republican party's conception of federalism.

In a very real sense, the opposing partisan conceptions of federalism reflect different strategies about how best to maintain federalism within a modern mass democracy. For the Democrats, the Madisonian maneuvering of interests within majority rule institutions offers a set of political safeguards for the position of the states in the federal system. Republicans prefer the judicial safeguard of articulated legal limits which courts would enforce (Kramer 2000; Hamilton 2001).

But whether the two parties will hold fast to their distinct positions on federalism is an open question. Since the Democrats' loss of their congressional majorities, they have increasingly supported giving state governments discretion over important policy decisions such as air pollution, electricity deregulation, health care, financial services, same-sex marriage, and stem cell research. At the same time, Republicans have used their control of Congress to push national standards even in functions traditionally associated with local governments (Krane 2002). The best example of this is President George W. Bush's support for the No Child Left Behind Act of 2001, which has been attacked by critics as "the single largest, and the single most damaging expansion of national power over the nation's school system in history" (Elmore 2003). But how does one account for this seemingly hypocritical stance toward federalism by both parties? It is important to remember "American federalism is a supremely political institution" (Anton 1989) and politicians pursue benefits for themselves and for their supporters by arguing for policy control at one tier of government or another as a means to those benefits. Simply put, federalism principles will be sacrificed for pragmatic policy gains. The ambiguity over assignments of functional responsibility abets battles over which level and institution of government should make a policy decision and which should pay and/or administer a policy. Because "no solution is ever final," "the federal system in the United States ... is always in flux" (Leach 1970). That the political parties will change positions over what some consider to be fundamental principles of American federalism should come as no surprise. After all, changing one's position about federal-state relations began in the early days of the Republic.

VII. CONCLUSION

As the foregoing has demonstrated, the concept of federalism in the American system of government has been undergoing change and adaptation ever since the drafting of the Constitution in 1787. It continues so. For some time now the nation has been in a transitional stage in federalism. The five ideas and concepts that have animated our system of government over the years may well be joined by another set of concepts. None of the original five has disappeared from the stage, however, and may be drawn on as the pendulum continues to swing. As a variation of states' rights federalism, state-oriented federalism, as already suggested, seems likely to be fleshed out, in the course of which process centralized and administrative federalism seem as likely to be significantly altered. And new federalism in the guise of devolution may well become dominant.

Adaptations are already in train, and the plethora of problems which demand government attention in the years just ahead suggest they will continue to be made. Health and welfare reform are perhaps the key areas of action, but curbing environmental abuses, expanding educational quality and opportunities, dealing with hazardous waste, coping with international terrorism, and rising to the challenges of what Drucker (1994) has called "the age of social transformation" will all impact on the federal system.

It is worth remembering that over the years theory has not been a very important element in the actual operation of the American federal system. For the most part, federalism has developed pragmatically rather than in response to a conceptual framework. Two things might be kept in mind: (1) constitutional federalism left it unclear, barring future amendments, as to the precise direction in which the federal ship was to sail, and (2) experience has shown that federalism being in flux is normal, for the founders created an open-ended system. We can only be the losers if we try

to close it off by adopting one set of theoretical principles, particular model, or set construct. As in so many areas, in building federalism the founders built better than they knew, and we are the beneficiaries.

I. INTRODUCTION

The policy sciences are characterized by a long past but a short history. For a discipline whose intellectual seeds were sown in the 1940s, the policy sciences have achieved remarkable success in altering the landscape of academic and government organizations. Clearly, public policies and policy advice can be traced back to the beginnings of history itself, but the contemporary policy sciences have a particularly American and twentieth-century flavor. Pre-World War II aspirations among a small core of American social scientists (such as John Dewey and Charles Merriam) for producing societally relevant knowledge led to the publication of *The Policy Sciences* edited by Lerner and Lasswell (1951). Lasswell's now-famous vision articulated in his contribution, "The Policy Orientation," was of a multidisciplinary, contextual, problem-oriented, and explicitly normative policy science. Achieving these ambitious goals has occupied the policy sciences throughout the remainder of the twentieth century and, indeed, into the twenty-first century.

The articulation and subsequent practice of the policy sciences have depended on the complex interaction of academic and social influences. From within the community of policy science, the struggle has been to expand the scope and uses of the approach. This dynamic, however, has always been tempered by the major social and political events of the day. Thus, the on-going emphasis on policy evaluation must be seen as a direct consequence of the social programs of the 1960s and education controversies, policy termination as a result of resource scarcity in the 1970s, 1980s, and the early 2000s, and the role of ethics and values at least partly attributable to the Watergate affair. As a function of these and other events, the policy sciences grew in both theoretical scope and applicability throughout the 1970s and 1980s. As will be discussed, the 1990s resulted in a partial reformulation, followed by a retrenchment in the early twenty-first century.

Today the policy sciences have moved beyond naive aspirations for societally relevant knowledge. The credibility of policy sciences has justifiably been challenged for failing to produce objective empirical and normative truths. In the 1980s, the emphasis on ethics and values and the inclusion of institutional analysis and public management as central policy concerns improved the scope of the policy sciences but were ultimately injurious to the credibility of their scientific status. Scientific rationality, thought by many to be the cornerstone of policy sciences, is being challenged by a broader concept of reason in society. Thus, the contemporary policy sciences are at a crossroads, wavering between narrow-gauge utility and a more complete understanding, with important amendments still to be made.

II. ASPIRATIONS FOR SOCIETALLY RELEVANT KNOWLEDGE

The policy orientation was not articulated until 1951 by Harold Lasswell, but its origins go back much further. The history of governing has always been marked by the relationships of advisor to ruler on a personalized and circumstantial basis. From Plato's Academy and the courts of the Chinese emperors to the modern policy institutes, people have been trying to bring knowledge to government and the act of governing. Although the American experience still owes much to the history of Western civilization, the conception, birth, and early growth of the policy sciences are in

many ways particular to the United States. Early American philosophical orientations (see John Dewey) favored a highly pragmatic and utilitarian concept of knowledge and science. These philosophical positions led both physical and social scientists to search for practical applications of their knowledge and expertise. Applied social science was a pre-World War II vision and, in some cases, a legitimate accomplishment among the nation's social scientists (Lynd 1939; Merton 1936). The policy sciences as described by Lasswell (1951) were the culmination of efforts to define a discipline for producing and applying societally relevant knowledge.

A. POLICY SCIENCES IN WESTERN CIVILIZATION

Policy analysis and its consequent advice have been practiced in one form or another since people have been making political decisions. Dunn (1981) considers the Code of Hammurabi, originating around the eighteenth century BC, to be among the earliest recorded examples of policy analysis. Tuchman (1984) re-creates a debate among the leaders of Troy about whether or not to accept the Greek-proffered Trojan horse as an example of an early episode (and failure) in policy analysis. Policy advice as a political exercise is hardly a new or novel idea. Still, historically, policy analysis and advice were very personalized, idiosyncratic activities, passing from sage to ruler with only scarce and episodic regard for routinizing the activity (Goldhamer 1978).

Systematic policy counsel grew out of the church and state relationship. Like many themes in Western civilization, it was not until the Italian Renaissance that policy advice assumed a more institutionalized basis, the writings of Machiavelli (1515/1959) being the most celebrated illustration. Thomas More's *Utopia* (1516) provided a haven for social contemplation; Bacon's *New Atlantis* (1627) applied scientific knowledge to the circles of government. The worldly philosophers such as Erasmus and the English political philosophers (e.g., Locke and Hobbes) set the intellectual tones for the subsequent study of politics and administration as the partial precursors of the policy sciences. And, of course, Jonathan Swift had the curious Gulliver observe the Academy of Projectors in his voyage to Legado, as its scientists worked to convert cucumbers into solar energy (1726).

Important in this historical progression was the growing political acceptance of knowledge and its substantive application for those with ruling responsibilities, a condition reflected by the influence of the eighteenth-century English political philosophers such as Burke, Locke, and Hume. The increased involvement and interaction of political philosophy with political events was apparent with the French philosophers, e.g., Montesquieu's *The Spirit of Laws* (1748) and Rousseau's *Social Contract* (1762), who preceded the Age of Revolution. The later American *Federalist Papers* (1787/1788) elaborated on the interplay of political doctrine with specific ideas as to how a government should be structured and operate.

However, while there might have been some basic recognition of the need for nominally independent policy advice regularly offered to governing bodies, this counsel was more likely to be tendered on a parochial, personalized basis, largely predicated on political caprice and association. The political philosophers of the day were far from objective, neutral participants. There was scant consideration of intellectual underpinnings, honesty, cumulative knowledge, or independent evaluations as they could be applied to policy issues. In short, there was little reason for these activities to be considered as the intellectual precursors of the policy sciences. There was little conception of a policy process or what composed a good policy; certainly there was no explicit research or literature on these issues. They did, however, provide an intellectual stimulus and some practical precedents to the later development and articulation in the pursuit of societally relevant knowledge.

The growth of applied empirical research in France and England during the nineteenth century coincided with public awareness of acute social problems (Dunn 1981). Descriptive statistics were used to plot the plight of the English urban poor. The English Industrial Revolution and the American Progressive movement both produced widespread demands for improvements in the inchoate social welfare programs. While new policies were initiated to relieve these tensions,

they certainly were not brought about by analytic (as opposed to literary) examinations of the conditions and trends. Examples of early research on the documentation and alleviation of social woes were not totally lacking, but were generally isolated and not cumulative (Bulmer 1982). Dickens and Shaw were probably more influential in affecting British social welfare legislation than Booth and the Webbs, just as the Tarbells and Sinclairs were primary movers in the American Progressive movement.

There were some unquestionably important early developments in the academic disciplines, which were later to leave their marks on the policy sciences. Beginning in the mid-eighteenth century, the study of economics began to mature as a set of possible insights into policy issues; Adam Smith's writing in political economy and David Ricardo's influence on English agriculture and free-trade policies are the most prominent examples. Historians were in the vanguard in contextual studies, but their works almost never assumed a prescriptive perspective. The principal intellectual motif of the late nineteenth century was that social laws akin to physical and natural counterparts could be discovered and applied. Social Darwinism—as interpreted by Herbert Spencer and T. H. Huxley—was a cultural phenomenon on both sides of the Atlantic. Finally, the study of politics and public administration was starting to define itself in matters pertaining to governance. In 1887, the academic study of American public administration was established by Woodrow Wilson, who realized that it was “getting to be harder to run a constitution than to frame one” (Wilson 1887). In short, academic disciplines were beginning to apply their skills and insights to social problems, that is, to test cautious notions of societally relevant knowledge.

Thus, even though the systematic and routinized examination of public policy issues and problems was not in existence by the dawn of the twentieth century—certainly not from an organized institutional basis—many disciplinary contributions that would later emerge as central components or stimuli to the policy sciences were starting to fall into place. However, these various approaches were developing their limited policy concerns and insights isolated from one another. They were largely defining themselves as very differentiated disciplines rather than coordinated, integrated approaches addressing social problems. Indeed, as these disciplines struggled for their respective, distinctive identities, they adopted their own intellectual boundaries that jealously precluded other perspectives. This trend affected the policy sciences well into the twentieth century.

B. AMERICAN PRAGMATISM AND INSTRUMENTALISM

American pragmatic and instrumental philosophies had a profound effect on the development of the social sciences. American philosopher William James, who popularized the term pragmatism, was reacting against an earlier and primarily European rationalist and empirical philosophical insistence on singular and objective truths. He saw the American experience as requiring a philosophy separate from its European antecedents. James (1975) held that truth and, by extension, societally relevant knowledge must conform to much more pluralist notions of reality. To these ends, he developed pragmatism, a philosophy later attacked as reflecting the material, practical, and even commercial values of American society (Ross 1970, xii). Pragmatism allows human perception, multiple interpretation, and debate to become an integral part of theories and meaning of truth and thus the political arena. Knowledge, embedded in a social context and valuable for the type of practical problems, would become a leitmotiv among twentieth century American social scientists. At the turn of the century, pragmatism provided a rationale for extending the application and relevance of the scientific approach to social, political, and economic components of life. As such, it was incorporated in the concept of the policy sciences through the writing of John Dewey.

Dewey extended James' pragmatist notions of truth and meaning to fit his more instrumental orientation. According to Dewey, the goal of scientific inquiry should not be some abstract version of the truth, rather a transformed situation (Dewey 1927). Knowledge and ideas are instruments that lead to action and are to be understood in terms of the consequences of those actions. Science, particularly social science, is to be judged on the basis of its contributions toward improving the

human condition. This instrumental view of the role of knowledge in society formed the basic premise of the policy sciences. Lasswell, in his 1951 essay, credited Dewey as an early example of a policy scientist more interested in “evaluating and reconstructing the practices of society than in higher ratiocination about the higher abstractions from which his values are derived” (Lasswell 1951, 12). In his preface to *A Pre-View of Policy Sciences*, Lasswell (1971, xiv) acknowledged, “The policy sciences are a contemporary policy adaptation of the general approach to public policy that was recommended by John Dewey and his colleagues in the development of American pragmatism.”

Perhaps even more important, Dewey developed a process of inquiry that still stands at the heart of contemporary policy process. Dewey (1929) outlined an instrumental process of inquiry, in which the investigator begins with a definition of the problem and proceeds through steps analyzing different alternatives (“ordering of suggestions”) and evaluating the consequences of each alternative before arriving at the alternative that best solves the problem. In Dewey’s words, scientific observation was impelled by active exploration and a sympathetic interest in solving some social and theoretical problem, not an end in itself (Dewey 1933). Finally, Dewey’s (1927) unending advocacy for—insistence upon—a democratic order is also reflected in the policy sciences.

Although pragmatism and instrumentalism provide a philosophical underpinning for the goal of producing societally relevant knowledge, they are also the source of the single most perceptive critique of the policy sciences. Specifically, the policy sciences have been attacked for serving as a high-priced apologist to political interests (Horowitz and Katz 1975). Given the open, pluralist ideals that instrumentalism espoused for societally relevant knowledge, it simply was not enough to produce relevant and action-oriented knowledge; one need ask, “Whose interests would knowledge serve?” and “What are the distributive consequences in terms of both power and resources of public policies?” These questions continue to haunt the policy sciences as they reveal the inherently normative nature of an instrumentally driven social inquiry.

As the policy sciences have evolved, so did their uses, intended or not. That good policy analysis can now support political actions as widely divergent as privatization and public ownership is ample evidence that public policy is inevitably also the study of who gets what, when, and how (Fischer 1993). Nevertheless, in the early twentieth century, the study of public policy provided a forum for social scientists to practice their pragmatist ideals of applied social science.

C. APPLIED SOCIAL SCIENCE

Most social scientists were initially reluctant to abandon their disciplinary training, but by the late 1930s, the idea that scientific advice and procedures could and should have a direct effect on social problems was no longer an academic fantasy, but was slowly becoming a personal and institutionalized expectation, although not without some friction. It was easier for academic departments to remain isolated from their surrounding communities than to test their knowledge in a social arena. Despite their reluctance, an integrated policy science was foreshadowed by isolated and largely fruitless attempts to foster an applied social science.

Charles Merriam, Lasswell’s University of Chicago mentor, was an early proponent of an applied, multidisciplinary social science. His 1925 presidential address before the American Political Science Association is indicative of these leanings:

Likewise we are likely to see a closer integration of the social sciences themselves, which in the necessary process of differentiation have in many cases become too isolated. In dealing with basic problems such as those of the punishment and prevention of crime, alcoholism, the vexed question of human migration, the relations of the Negro, and a wise variety of industrial and agricultural problems, it becomes evident that neither the facts and the technique of economics alone, nor of politics alone, nor of history alone, are adequate to their analysis and interpretation....

After all, it does not seriously matter what this integration is called, whether sociology or *staatswissenschaft* or anthropology or economics or politics. The essential consideration is that the point of view and the contacts are obtained and sustained in the various fields of social inquiry; that partial treatment does not twist and warp the judgment of social observers and analysts. The problem of social behavior is essentially one problem, and while the angles of the approach may and should be different, the scientific result will be imperfect unless these points of view are at times brought together in some effective way, so that the full benefit of the multiple analysis may be realized (Merriam 1926, 8–9).

However prescient Merriam might have been in his assaults on disciplinary satraps and appeals for applied social science research, his exhortations fell on fallow ground. Few university departments or professional associations followed his lead. They might have been too busy consolidating and protecting their own professional identities and egos, or they might have been too enamored with the hallowed academic tradition of independence from their surrounding communities. Although certainly there were intellectual refinements during the 1930s, most were directed internally toward methodological enhancements rather than externally toward community problems. Political science, for example, became embroiled in the behavioral debate, while economics was thoroughly enmeshed in its own theoretic coils of empiricism, even if this meant distancing itself from Adam Smith's legacy. The emerging field of public administration—one consciously directed toward improving the practice of government—was practically emasculated by its domestic squabbles over the politics versus administration dichotomy and the role of bureaucrats as an instrument of governing (White 1948; Willoughby 1927).

There were, to be sure, individual and institutional exceptions to this disciplinary protectionism: sociologist Robert Merton (1936), economist Wesley Mitchell (1937), the establishment of the Social Science Research Council (incorporated in 1923 under Merriam's tutelage and the sponsorship of the Rockefeller Foundation), and the consolidation of the Brookings Institution (in 1928 with assistance from the Carnegie Foundation) come prominently to mind (see Critchlow 1985; Lyons 1969). However, these exceptions were so striking as to support the observation that multidisciplinary research and its applications to social problems were like foundling children, i.e., largely unappreciated.

Thus it is not surprising that in 1939, Robert Lynd posed the question, *Knowledge for What?* Arguing against what he viewed as excessive empiricism and social detachment, he cautioned, "If the social scientist is too bent upon waiting until all the data are in... the decisions will be made any way without him... by the 'practical' man and by the 'hard-headed' politician chivvied by interest-pressure bloc" (Lynd 1939, 9). What, asked Lynd, in an echo of the pragmatist theme, was the ultimate purpose of knowledge—for its own sake or to better society? The answer was clear in most academic circles: the very idea of societally relevant knowledge was in deliberate neglect. This neglect was profoundly altered by World War II, in which American intellectual resources were mobilized to confront the immediate exigencies at hand.

Immediately after World War II, Congress and the executive branch sought to define the government sponsorship of scientific research as an instrument of public policy. This was a radical concept at the time, one whose discussion grew heated as Congress debated the creation and purview of what was to become the National Science Foundation (NSF) (Lyons 1969; Polsby 1984). The relative disparity between the social and physical sciences was highlighted during the NSF deliberations. The former were excluded from the Foundation's sponsorship when the NSF was mandated in 1950. As Senator William Fulbright commented during the hearings, "People simply don't appreciate the significance of the social sciences, which means your legislators don't either" (Lyons 1969, 33). This attitude hardly boded well for the development of the policy sciences, which might have had a claim on the issue of relevance but had no organized stakeholders to articulate their case.

There were, however, key proponents willing to span academic disciplines and argue forcefully for the necessary application of multidisciplinary research to social problems. Robert Merton, in his

landmark 1949 article, called for an “applied social research on applied social research to ferret out the public images of social science, particularly among makers of policy in government, labor and business.” Asserting that it was “well-known, a given practical problem requires the collaborative researchers of several social sciences,” Merton stated, “[p]ractical problems are many faceted. They can be examined from the perspectives of several different disciplines.” Merton challenged social scientists to “sensitize policy-makers to new types of achievable goals... and to more effective means of reaching established goals.” He concluded that “a major function of applied research is to provide occasion and pressures for interdisciplinary investigations and for the development of a theoretic system of ‘basic social science,’ rather than discrete bodies of uncoordinated specialized theory” (Merton 1949, 167 and 171).

III. LASSWELL’S VISION OF THE POLICY SCIENCES: THE EARLY DECADES

Harold Lasswell is considered to be the founder of the policy sciences. His essay on “The Policy Orientation” in *The Policy Sciences*, co-edited with Daniel Lerner (1951), articulated the policy map of social science discipline and practice. The subsequent development of the policy sciences can be traced to three principal defining characteristics, as set forth by Lasswell (1951): *multi-disciplinary perspective*, *contextual and problem-oriented in nature*, and *explicitly normative*. In many ways, these represent different emphases, for they reflect distinct events and conditions. In other ways, they are mutually reinforcing. For purposes of the present exposition and at the risk of some redundancy, they will be discussed individually because each had an identifiable influence on the evolution and acceptance of the policy sciences.

A. MULTIDISCIPLINARY PERSPECTIVE

Lasswell’s early admonitions were immediately policy-directed in nature and multidisciplinary in execution:

A policy orientation has been developing that cuts across the existing specializations. The orientation is twofold. In part it is directed towards the policy process, and in part towards the intelligence needs of policy. The first task, which is the development of a science of policy forming and execution, uses the methods of social and psychological inquiry. The second task, which is the improving of the concrete content of the information and the interpretations available to policy makers, typically goes outside the boundaries of social science and psychology (Lasswell 1951, 3).

Lasswell (1951, 3) stressed that the policy sciences were not to be equated with “applied social science” or “applied social and psychological science.” “Nor,” he cautioned, “are the ‘policy sciences’ to be thought of as identical with what is studied by the political scientists” (Lasswell 1951, 4). Dedicated to the “fuller realization of human dignity,... the basic emphasis of the approach...is upon the fundamental problems of man in society” (Lasswell 1951, 8). Finally, after arguing for a closer relationship between the potential adviser and the policy process, Lasswell advised, “in order to bring the academician and the active policy maker into fruitful association, new institutions are needed” (Lasswell 1951, 14).

Like Merriam and Merton before him, the scenarios laid down by Lasswell of the policy sciences approach were seemingly left largely unattended. Except for an occasional review of the Lasswell volume (Kecskemeti 1952), contemporary academicians were just as oblivious to the message as their interbellum counterparts. The obvious audience should have been political scientists, but they were internally focused by their behavioral conflicts and had little inclination to adopt a new disciplinary focus. Many years and reflections later, Lasswell was asked how he might explain this attitude; he responded somewhat ambiguously, “I guess the times just were not right.” The policy sciences movement remained basically dormant until the late 1950s and early 1960s.

Operations researchers and economists moved aggressively into the world of application. Lineberry argues that the roots of the policy sciences lay within economics, not political science, and cites Tjalling Koopmans: “efforts during World War II to develop a theory of resource allocation” were he to “locate the origins of policy sciences ... with a person and place” (Lineberry 1982, 7). Operations research and systems analysis applied their methodological tools to a series of discrete problems with some noted successes. Even though the more cognizant systems analysts generally limited the scope of their work, the equating of systems analysis and policy analysis was reflected in much of the literature. Majone and Quade (1980, 5) wrote that “systems analysis and policy analysis are used as essentially synonymous terms for the same activity.”

At the same time, system analysis and cost-benefit analysis were enjoying bureaucratic success in certain sectors of government, especially in the Department of Defense (Enthoven and Smith 1971; Hitch and McKean 1960). Although the more perceptive practitioners always warned of their limitations, cost-benefit analysis, systems analysis, program-planning budgeting system (PPBS), and quantitative modeling became prevalent passwords for policy analysis (e.g., Quade and Boucher 1968); the seeming need to reduce all policies to a set of economic or quantitative indicators became pervasive. Analytical techniques and procedures of the defense realm were soon extended to social issues. In 1966, President Lyndon Johnson ordered PPBS as practiced in the Department of Defense to be instituted in the Department of Health, Education, and Welfare. However limited these approaches might have been, it should be admitted that their practitioners were venturing out beyond academe and applying their theories and tools to real world issues.

These approaches were, like their social sciences predecessors, soon seen to have run their bureaucratic course. Systems analysis was seen to be largely insensitive to public policy issues (Hoos 1983). Similarly, economics had its limitations, even in apparently proprietary economic issues (Green 1972; Heller 1975). The inability of PPBS to repeat its Defense Department successes (Wildavsky 1979) were practical evidence that public policy problems often—perhaps typically—refused to be corrected because of their very complex, interactive, and changing natures. The agnostic perspective on policy goals, the stress on optimization, the neglect of process and procedure, and the acceptance of microeconomic assumptions regarding human behavior simply proved to be inadequate bases for treating public policy issues (Mead 1983). As Stone (1997) later emphasized, the general tendency of these theories and programs to exclude normative considerations—to emphasize efficiency to the exclusion of equity—was unacceptable to political policy makers. These growing awareness and sensitivities led policy analysts to propose new conceptual paradigms and methodological approaches to what were coming to be known as “squishy” problems (Strauch 1975, 1976).

At the same time, there was a school of thought that viewed the policy sciences as an opportunity for developing an all-encompassing metatheory of political interactions, whose purpose was to integrate the social and physical sciences, fulfilling Comte’s vision of social physics as a means of alleviating society ills. Merton (1949, 171) asserted that “a major function of applied research is to provide occasions and pressure for interdisciplinary investigations and for the development of a theoretic system of ‘basic social science’.” Dror (1970, 138) was even more emphatic: “Policy sciences must integrate knowledge from a variety of branches of knowledge into a supradiscipline focusing on public policy-making.” Although well intended, these efforts were quietly abandoned because they lacked the necessary theoretical foundation and empirical substance to support such an enterprise, as Lasswell (1951) clearly suggested in “The Policy Orientation” and Merton (1949) implied when he formulated his research agenda based on midrange theories. Lasswell and Merton were careful not to force the policy sciences goals and components into premature intellectual and definitional straitjackets that Dror’s (1971a, 1971b) approach would have entailed.

Other scholars looked to the nascent policy sciences movement as a means to coordinate several of the social sciences, with each discipline still retaining its individual identity (see Charlesworth 1972; Coleman 1972). An early leading text in the field, written with chapters drawn from the various contributing disciplines and case materials, reflects this orientation (Bauer and Gergen 1968).

Explicit in this theme was the hesitant recognition but still unproven hypothesis that the various disciplines would provide different but complementary perspectives on a given problem. The fact that operations research texts routinely included chapters on policy implementation alongside their technical exegeses (Larson and Odoni 1981) and social psychologists became leaders in policy evaluation (Campbell 1969) reflected the growing acceptance of the limitations of single-discipline policy research and the priority of multidisciplinary policy research.
